PUBLISHED FOR THE PROPRIETORS,
AT 5, UPPER WELLINGTON STREET, COVENT GARDEN.
1855

INDEX OF CONTENTS

TO THE

GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE,

For 1855.

A.

Abies, Kæmpferi, 242, 644; Hookeriana, 372; Pattoniana, 372; cilicica, 707
Aboriculture, Scottish Society of, 100, 135
Abronia umbellata, 520, 533
Accounts, farm, 287
Achimenes, 69
Aconitine, 319
Acre, dimensions of, 14; English, 680
Acrophorus hispidus, 661
Acton's (Eliza) Cookery, rev., 471, 839.
Adiantum cultratum, 660
Adulterations, to detect, 71, 362
Agaricus cepæstipes, 821
Ægilops, Godron on, 151, 188
Æschynanthus Peeli, 516
Agriculture, progress of, 9; Hints on, rev., 13; Lois-Weedon, practice of, 3, 4, 6, 22, 37, 38, 76, 586, 636; modifications of do., 27; Lavergne on British, 26; in the west of France, 106; and geology, 121; and the weather, 122; backward, 140; Wilson on past and present, 196; do. on that of the French Exhibition, 795, 796; as a science, 248; and chemistry, 161, 322; steam applied to, 75, 226, 266, 267, 322, 345, 362, 364, 379, 410, 426, 427, 443, 458, 459, 473, 507, 553, 554, 573, 620, 650, 652, 730, 781, 811; peculiarities of, 652; profits of, 682; function of salt in, 665, 700, 732; Irish, 698; Hungarian, 701; improved, 763; Yester, 797
Agricultural buildings, portable, 764
Agricultural chemistry, 161, 322; Harcourt on, 138; Liebig's, rev., 358; new principles of do., 521; Lawes on, 667, 682
Agricultural College, sessional examinations, 458
Agricultural economy, 843
Agricultural education, 363, 590, 685, 795
Agricultural implements, chaff-cutters, 491; prizes for at the Agricultural Society's Meeting, 508; remarks on do., 506, 522, 571; new clod-crusher, 605, 652
Agricultural labourers, 765; dwellings of, 28, 211; and masters, 180; wages of in Ireland, 181, 746; number of on farms, 247; gathering at Coleshill, 457; schools, 538, 572, 714
Agricultural machinery, reaping, 13, 507, 652; trial of do. selected from the Agricultural Society's Meeting, 589, 635, 649, 651; competition of do. at Stirling, 618; Australian do., 141; root grating, 60; threshing, 507, 780
Agricultural prejudice, 197
Agricultural statistics, 29, 45, 90, 138, 458, 491, 492, 551, 601, 634, 652, 668, 682, 732, 842, 844, 857
Scottish, 106, 180, 211; Irish, 748, 845; Lock's observations on, 227, 247, 377; Hannam on, rev., 748.
Agricultural societies, advantages of, 668. (For reports of see Societies.)
Air, importance of, to plants, 595
Allamanda grandiflora, 486
Allotments, 733
Aloe, American, 550, 566
America, Pears on Quince stocks in, 6; Axes of, 174; timber of, 262; winter in, 456; Plums of, 726
American blight, 224; Aloe, 550, 566
Amherstia nobilis, 22
Ammonia, sources of, 59; formation of, 605; salt a fixer of, 665, 700, 732
Amygdalus persica, 283
Anacharis alsinastrum, 582
Analysis, of stone brashes, 122; of manures, 140; of Arachis or Earth-nut cake, 268; of superphosphates, 381, 604, 634; of oilcake, 557; of bran, 621; of crops, 797
Anatomy, Prof. Owen's lectures on, rev., 519
Anbury, 572, 804, 810
Angler, Dr. Davy's, rev., 439
Angling, Penn's Maxims, &c., on, rev., 487
Annuals, list of, 5, 21; treatment of, 357; Thompson on, rev., 551; soil for, 551
Ants, to destroy, 376, 390
Aphanes arvensis, 281
Aphelandra variegata, 116; Porteana, 116
Aphides, reproduction of, 550
Apples, Dommiska, 134; Gooseberry, 664; monstrous, 692; Star, juice of, 712; cracked, 724
Apricots, non protection of, 336, 358; in orchard houses, 806
Aquaria, forms of, 727; enemies to fish in fresh water, 339; preserving sea water in a healthy state in salt, 535; and water snails, 568; seaweed for, 599, marine, 838
Arago's Meteorology, rev., 631; astronomy, rev., 822
Araucaria leaves, diseased, 36
Argan tree, 284, 303
Argyroneta, 806
Arnott (Dr.), on ventilation, &c., 595
Artichokes, to plant, 189; Jerusalem, 748
Arundel Castle Gardens, 567
Ascension, vegetation of, 851
Ash, berries of Mountain, 648
Asia Minor, vegetation of, 707, 806
Asparagus, to salt, 56, 504; beds, 134, 189, 192; frosting, 303
Association, British, 647
Astragalus pod, 632
Atmosphere, chemistry of the, 286; of hothouses, 727
Atropa mandragora, 776
Auricula, culture of, 40, 243
Australia, Hargreaves on, rev., 23; to pack seeds for, &c., 24, 744; gardening notes from, 119; reaping machine in, 141; Wheat in, 140; in 1854, by Walthen, rev., 207; cochineal of, 339; seeds of, to sow, 696; Passiflora, 710; sheep of, 812; gardening in, 836; farming in, 842; transport of roots, &c., to, 852
Autumn, 805
Axes, American, 174
Ayrshire, Italian Rye-grass farms of, 57, 158, 159; cows, 180
Azaleas, hardiness of, 406; hardy, 424

B.

Bacon, to salt, 702
Badger, foot-prints of the, 176
Baker's Ceylon, rev., 710
Balsam, culture of, 373
Bamboos, growth of, 839
Bamean, 264
Bananas, to dry, 648
Barley, averages, 44, 59; returns respecting the state of, 553, 554
Barnes' (Mr.) nursery, 283
Basil (Ocimum basilicum), 472
Bast, different kinds of, 219
Batatas edulis, 820, 839, 854
Beans, French, and the red spider, 38; v. roots, 108; Haricot, 208; returns respecting the state of, 553, 554; for horses, 637, 683; St. Ignatius, 648; winter, 653
Beech trees, to remove, 776
Beech-oil, 807, 851
Beer, making, 557, 695; effect of Hop sulphuring on, 563, 579, 581, 597, 630, 678, 743
Bees, to chloroform, 552, 630; v. fruit, 566
Beekeeper's Manual, Taylor's, rev., 599
Beets, grafting the cultivated, 360
Begonia fuchsioides, 648
Belvoir Castle Gardens, 759, 775
Bennett on the Cultivation of Potatoes, rev., 493
Berlin, ground temperature of, 260
Birds, migratory, 358; predatory, 556; memoranda concerning, 757; pectoral sun, 790
Blackberries, white, 54
Blight, American, 224
Blight composition, Page's, 488, 518, 566, 598
Blood manure, 28, 229, 307, 344
Boilers, are large economical? 261, 318, 335; setting, 264
Bolbophyllum lasianthum, 53
Bolden (Mr.) death of, 93
Books Noticed: Baines' Flora of Yorkshire, 6; Hints on Agriculture, 13; Delamer on Flax, 13; A Month in the Camp before Sebastopol, 23; Tit for Tat, 23; Hargreaves' Australia, 23; Lavergne's Rural Economy of England, 426; Locke's Ireland's Recovery, 28, 246; Englishwoman in Russia, 39; Tourgheniff's Russian Life in the Interior, 39; Knight's Knowledge of Power, 55; Ainsworth and Yeats' Algebra, 55; Denton on Land Drainage, 60, 105; Hassall's Food and its Adulterations, 71; Mérat's Remarks on the Tuberous Plants proposed as Substitutes for the Potato, &c., 76; Iconographie des Orchidées de la Collection de M. Pescatore, 87; Album Vilmorin, 88; Allen on Victoria Regia, 88; Marryat's Mountains and Molehills, 103; Corner's Familiar Fables, 103; Resources of Chili, 119; Fenn's Compendium to English and Foreign Funds, 120; Forbes' Literary Papers, 120; Timbs' Curiosities of London, 120; Dairy for the Poultry Yard, 124; Idle's Hints on Shooting, &c., 124; Scrutator's Horses and Hounds, 124; Irish Flax Society's Report, 124; Galton's Art of Travel, 135; Ribbans' Tintern Abbey, 135; Waterlow, Every Man His own Printer, 135; Harcourt on the Connection of Chemistry with Agriculture, 138; Agricultural Society's Journal, 144, 477; M'Intosh's Book of the Garden, 155; Davis' Farming Essays, 162; Koch's Crimea and Odessa, 171; Lund's Geometry and Mensuration, 176; Hoare, Mensuration Made Easy, 176; Morton's Agricultural Cyclopedia, 180; Hooker's Century of Ferns, 191; do. Botanical Geography, De Candolle's, rev., 615
Bottomley on Hand Tillage, rev., 444
Bradbury's Ferns Nature Printed, rev., 223
Bran, analysis of, 621
Bread, detection of adulterated, 362; household, 762; Potatoes in, 828; brown, 860
Brewer's Atlas, rev., 743
Brewing, Dr. Kemp on, 695
British Association, 647
Broccoli, seeds, 70; club in, 85; succession, 302
Brushwood, drains with, 732, 780, 796
Bryologia Britannica, 283
Budding knife, 520
Buddleia Colvilei, 516
Bug, Chrysanthemum field, 757
Buildings, arboral records of, 504; portable farm, 764
Bulbs, treatment of after flowering, 118; culture of Dutch, 483; list of ditto, 484
Bulls, short-horned, 89, 245, 247, 265, 286, 307, 322, 410
Butter, taste of, 290; production of, 250, 267 324, 341, 345, 363, 425, 427, 441, 448, 459, 474, 475, 490, 522, 538, 572, 588

C.

Cabbages, after Tares, 229; cow, 283
Cabbage leaf, monstrous, 677
Cactus house, Kew, 486
Caird on the harvest, 731, 761, 762, 777
Cake, earth-nut, 813
Calceolarias, herbaceous, 72; violacea, 852
California, Marryat's life in, rev., 103
Calves, rearing of, 74; Linseed for, 269
Camellias, propagating, 23; sweet scented, 54, 70, 86; to bloom, 69; buds dropping off, 88, 533; reticulata at Bank Grove, 283; in Cornwall, 317; to set, 566
Canvas, to waterproof, 192
Caoutchouc, manufacture of, 318
Capers, 520
Capsicums, to pickle, 664
Cardoons, 262
Carnations, sporting of, 7; tree, 23; late, 264 283; running of 359

Carrière, on Conifers, rev., 455; on transplanting, 499
Carton (Mr.), and his family, 54
Carts, small, 574
Catalogues, nurserymen's, 54
Catalpa Bungei, 788
Catasetum incurvum, 4
Caterpillars, Gooseberry, 24, 281, 302, 358, 500, 517, 518, 532, 533, 540, 550, 566
Cattleyas, sale of, 316
Cattleya Mossiæ, seed pods on, 614
Cattle, measurement and weight of, 10, 11, 45, 510; market, new Smithfield, 25, 41, 42, 57, 74, 229, 364, 397; plan of do., 43; opening o do., 411; feeding, 179, 732, 796; statistics of do., 75, 90, 107, 125; Mr. Hatton's system of do., 77; how prize are fed, 125; to stall feed, 700, 761, 811; green food for, 307; straw chaff as do., 307; do. for young, 557; pedigrees of, 89, 139, 180; short-horned, 89, 245, 247, 265, 286, 305, 307, 309, 322, 410, 525; pleuro-pneumonia in, 108; shedding for, 140; breeding, 211; will they pay their keep? 250; management of dairy, 324, 345, 379; show of at Paris, 341, 393, 395, 441; Prof. Wilson on do., 795; disease, Russian, 443, 475; at the Agricultural Society's meeting, 509; remarks on do., 572; shows of fat, 729; fattening of at Kilrush Farm, 811; report of at Smithfield club, 809, 825, 826; do, at Birmingham, 826
Cauliflower, seed of to sow, 262
Celery, culture of, 469
Cemetery, city of London, 535
Centradenia rosea, 85
Ceylon, Baker's, rev., 710
Chærophyllum Prescotti, 372
Chaffcutters, 491, 508
Chair, cottagers', 69
Chandler's (Messrs.) nursery, 176
Charcoal, uses of, 60
Charity, administration of a, 140
Cheese, Cheshire, 461; mity, 590; manufacture, 669
Chemical Field Lectures, by Dr. Stöckhardt, 807
Chemistry, Harcourt on the connection of with agriculture, 138; farm, 161, 322: of the atmosphere, 286; Liebig's Agricultural, rev., 358; new principles of do., 521; Lawes on, 667, 682
Cherries, brandy, 584; (Prunus cerasus), 696
Cherry trees, effects of spring frost on, 454
Chili, natural resources of, 119
China, effects of the rebellion on, and its productions, 502
Chinese Primrose, 7, 23; Yam, 19, 318, 517, 582, 599, 614, 646, 693, 709, 755, 773, 775; Note Book, 242, 318, 502; plants, hardiness of, 318; white wax, 338; flower-pot, 357; silkworm, 436
Chiosso's Gymnastic Polymachinon, rev., 488
Chiswick, exhibitions, 3; fall of rain at, for the years 1841—1854, 8; garden noticed, 71, 139, 207, 303, 375, 439, 518, 599; temperature at, 99; fêtes at, 333, 419, 467; reports of do., 336, 422, 470; list of awards at do. for May, 333; for June, 418; for July, 467; promenade at, 483; orchard house at, 611; sale of plants at, 744; discontinuation of exhibitions at, 709
Cholera flies, miscalled, 710
Chorozemas, 317
Chrysanthemums, culture of, 283, 440; Pompone, 375; Mr. Salter's, 807; in the Temple Gardens, 823; out-door, 839
Chrysanthemum field bug, 757
Churning, 250, 267, 324, 345, 363, 425, 427, 441, 443, 459, 474, 475, 490, 522, 538, 572, 588
Cincinnati, hog population of, 525
Cinerarias, compost for, 192; culture of, 223, 653; new, 791
Citronworts, to propagate, 533
Civil service, 131
Clark's Mollusca testacea, rev., 407
Clay, Figs on heavy, 659; burnt, as manure, 698; soils, treatment of, 697
Climate, Crimean, 36, 171, 189, 191; of Nice, 37, 69, 85, 118, 189, 221, 302; of Naples, 221; of Madras, 241; of foreign countries, 389; of Orchids, 472; local, 564; effect of, on fertility, 602; Indian, 723; remarks on, 757
Climbers, greenhouse, 360
Clod crusher, new, 605, 652
Clover, to sow, 308; and haymaking, 380
Club in Broccoli, 85
Clubs, Sparrow, 427. (Farmer's, see Societies.)
Coccocypselum cordifolium, 804
Cochineal, Australian, 339
Cockneyfied, what is? 662
Cockroaches, to kill, 360, 421
Cockscombs, culture of, 38
Cœlogyne plantaginea, 20; micrantha, 173
Coffee cultivation, 711
College, Cirencester Agricultural, sessional examinations, 458
Collins', the case of the, 620
Collomia grandiflora, 536
Colour of trees, 787
Commutation averages, 44, 57
Concrete, 618
Conifers, collectors and cultivators of, 22; to graft, 66; naming, 190; new, 263; ill effects of keeping in pots, 281; hardiness of, 302; Carrière on, rev., 455; to group, 787
Conservatory borders, 118
Constantinople, Cypresses at, 707, 806
Cooke on Wheat growing, rev., 733
Cookery, Eliza Acton's, rev., 471, 839; French, 790
Copper vessels and preserves, 241
Corn, imports of, 58; averages of, 44, 59; origin of, 151, 188, 355; tillering of, 556; supply of, 748, 794, 810; Caird on do., 731, 761, 762
Corn trade, influence of statistical information on, 619
Cornmill, Turner's, 556
Corner (Miss), Familiar Fables, 103
Correa, Brilliant, 436
Corylus avellana, 599
Cottages, labourers', 28, 211; ornamental, 823
Cottagers' comforts, 69
Cotton Plant, seed of, 855
Cotton seed, oilcake from, 698, 796
Coverings, woollen netting as, 24; for glass structures, 677; straw, 135; wall, 336, 373, 677; snow, 100, 134; spring for wall trees, 189, 239, 302, 317, 389, 406, 502, 518; for frames, 773 775
Cows, history of Duchess, 139, 180, 245, 247; Ayrshire, 180; produce of dairy, 250, 341, 345 363, 379, 425, 427, 441, 443, 459, 474, 475, 490, 522, 538, 572, 588, 732, 747; in milk, 540; Alderney, 588
Crag, discovery of red, 566
Crickets, trap for, 136
Crime and punishment, 194, 246
Crimea, preserved vegetables for the, 23; climate of, 36, 171, 189, 191; and Odessa, by Koch, 171; seeds for the, 318; gardeners for the, 373; Milner on the, rev., 487; flowers of the, 566, 567; Stanford's map of the, rev., 743
Crithmum maritimum, 336, 281, 303; an antiscorbutic, 317
Crops, effects of various kinds of manure on Turnip, 76, 108; ro ation of, 91; top-dressing for, 194; root, culture of, 228, 249, 796; Wheat, 226, 588; green, weight of, 269; in Yorkshire, 379, 459, 588; reports of, 521, 538; returns respecting the state of, 553, 554, 794, 810, 827; green do., 553, 554; in Hants, 572; Fen, 588; in Ireland, 605, 637; Mustard seed, destruction of, 726; composition of, 797; Caird on the, 731, 761, 762, 777
Crystal Palace, 567; plants in the interior of 263; grounds of, 7, 263; horticultural show at, 387; report of ditto, 390; Fern judging at do., 389, 406; awards at do., 402
Cucumbers, Ipswich Standard, 190, 758, 774, 792; ridge, 206; roots, excrescences on, 220; disease in, 260, 301, 741, 838; gigantic, 438; amount of produced by one plant, 693, 710, 727, 742; Star of the West, 773; pit for, 776
Cucurbita perennis, 836
Cupheas, standard, 727
Cupressus, Lawsoniana, 372; Macnabiana, 420
Currants, to prune, 102; to propagate, 153; new way of ditto, 454; Champagne, 646
Cuttings, raising Vines from, 262
Cyclamen cilicium, 708
Cypresses at Constantinople, 707, 806
Cytisus Adami, 136

D.

Dactylis glomerata, 140
Dahlia, 88; seedling, 56; for exhibition, 338; and Hollyhock show, 679, 696
Dairy, produce, 522, 538, 588, 732, 747; effect of temperature on ditto, 267, 289, 344; management of a, 250, 341, 345, 363, 379, 425, 427, 441, 443, 459, 474, 475, 490, 572, 588
Darnel (Lolium temulentum), 373
Datura ceratocaulon, 54, 70
Davallia dissecta, 469; bullata, 532; canariensis, 584; tenuifolia, 709
Davy's (Dr.), Angler, rev., 439
Decaisnea insignis, 515
De Candolle's Botanical Geography, rev., 615
Delamer on Flax, rev., 13; do. on Kitchen Garden, rev., 679
Dendrobium cumulatum, 756
Devonshire, temperature, &c. at, 6; the late winter in, 773
Diarrhœa, cure for, 758
Dielytra spectabilis, a vegetable, 262
Digging, prices of, 3, 6, 37, 38, 68, 154; ditto of double, 22
Dioscorea Batatas, 19, 318, 517, 582, 599, 614, 646, 693, 709, 755, 773, 775, 820
Dipladenia crassinoda, 117
Disa grandiflora, 262
Discoveries, Reviewers', 38
Diseases, on Araucaria leaves, 36; in lambs, 108; Vine, 188, 205, 264, 440, 532, 582, 693, 694, 710, 773; ditto in Madeira, 205; ditto new, 264; Cucumber, 260, 301, 741, 838; of plants, 376; Onion, 421, 484, 502; Russian cattle, 443, 475; Oat, 569; effect of sulphur in curing Hop, 563, 579, 581, 597, 630, 678, 742; "calico," Potato exempt from, 598; Gladioli, 676; Mangel Wurzel, 788; Payen on, 788 (see Pathology)
Dorset, rain in, 22; farming in, 290; the spring in, 358
Dorthesia Seychelles, 836
Downing's Hydraulics, rev., 775
Dracæna indivisa, 264
Dracophyllum gracile, 134
Drains, stoppage of, 140; roots in, 228, 268, 363; to clear choked, 421; with brushwood, 732, 780, 796; running of, 764, 812
Drainage, 180; Denton on, 60, 105, 825, 828, 841; companies, 105, 122, 138, 158, 161; sand 268; experiences in, 287, 306, 344, 394, 426, 442, 666, 715; subterranean, 289, 708, 743, 758, 804; warmth conferred by, 651, 699, 732; Keythorpe, 762; different kinds of, 793
Draining, 123; deep, 540, 557; do. and shallow, 12; v. trenching, 179, 180; for Sugar-cane in Jamaica, 646
Drew's Meteorology, rev., 374
Drill, dry v. water, 778
Drynaria Fortuni, 708
Dry rot, 284; in Potatoes, 334
Dublin Botanic Garden, 855
Dumfriesshire, rain in, 38
Dung, value of pigeon, 250, 290; farm-yard, 779
Dutton Hall Farm, noticed, 861
Dyes, Lichen, 518

E.

Earth-nut cake, 813
Economy, agricultural, 843
Edinburgh, park at, 339
Education and natural history, 53; agricultural, 363, 590, 685, 795
Electricity and plants, 708

Laurustinus from seed, 614
Lavergne's Rural Economy of England, &c., 26
Law expenses, 45, 75
Law of tenancy, 840
Lawes' (Mr.) testimonial, 491, 809; experiments, 667, 682
Lawns, effect of gas lime on, 281; mowings and sweepings of, as manure, 440; cure for worms on, 760
Lawrence (Mrs.) death of, 548; plants, 632
Layering pot, 420
Leases, farm, 124, 308
Leaves, Mangel Wurzel, 269; skeleton, 284; excrescences on Vine, 360; cure for burning of, 469, 518; Cabbage, monstrous, 677; colour of tree, 787
Leptodactylon californicum, 516
Lettuces, to blanch, 156; Bedale Hall, 190, 222; May's Magnum Bonum, 206, 222, 488
Libocedrus decurrens, twin, 358
Lichen dyes, 518
Liebig's Agricultural Chemistry, rev., 358; new principles of do., 521
Lightning conductors, 693
Lilium giganteum, 224; nepalense, 564
Lime and salt, 61; phosphate of, as manure, 409; to apply, 590; superphosphate of, 493, 633, 812; guano and do., 575; analysis of do., 381, 604, 634; to make do., 750; refuse of gas-works, 797
Lindley's Theory of Horticulture, rev., 359
Linseed crushers, 508
Liquid manure, 723, 778; subterranean application of, 12, 13, 58, 76, 108, 119, 153, 190, 709, 743, 758
Locke's Ireland's Recovery, 28
Loddiges' (Mr.) plants, 39; Orchids, 647
Lois Weedon, cost of digging at, 3, 6; cultivation, 4, 37, 38, 76, 586, 636; modification of do., 27
Lolium temulentum, 373, 443
Lomaria discolor, 661
London gardens, 239, 438
Longevity, Flourens on Human, rev., 391; of seeds (see Vitality)
Loudon's Encyclopædia of Plants, rev., 338
Lowe's Natural History of Ferns, rev., 759; Magazine of Natural Philosophy, rev., 775
Low (Mr.) nursery, 191
Loy, Irish, 154
Lungwort, 456
Lycaste misochlæna, 788
Lychnis Sieboldi, 116
Lycopods, hothouse, 471; luminous, 743
Lyell's Manual of Geology, rev., 303

M.

MACHINES, reaping, 13, 507, 652; trial of do. selected at the Agricultural Society's meeting, 589, 635, 649, 651; competition of do. at Stirling, 618; Australian do., 141; root-grating, 60; mowing, 241, 303; threshing, 507, 780; transplanting, 582, 598, 614, 646, 710; Potato digging, 734; water drill v. dry, 778
Machinery, oil for, 124
M'Intosh's Book of the Garden, rev., 155
Mackenna on Chili, rev., 119
Maclura aurantiaca, 173, 208, 281, 302, 317
Madeira, Botany of, 175; Vine disease in, 205
Madras, climate of, 241
Magnolia Campbelli, 515
Maladies, vegetable, 188 (see Pathology)
Malt mills, 638
Mangel Wurzel, Buckman on the growth of, 44; hardiness of, 211; leaves, 269; seed, 395; for pigs, 716; injurious to breeding sows, 397, 411, 475, 491; Whittington on, 542; disease, 788
Mangosteen, 259, 406; at Syon, 371
Mann on Reproduction, rev., 534
Manures, liquid, 723, 778; subterranean application of do., 12, 13, 58, 76, 108, 119, 153, 190, 709, 743, 758; blood as, 28, 229, 307, 344; time for applying, 29, 139; garden refuse as, 40; covered yards for, 46; for Turnips, 76, 108; sewage, 91, 157, 161, 193, 196, 209, 212, 506; for top-dressing, 138; analysis of, 140; artificial, 194, 763; pigeon, 250, 290; for Rose trees, 264; nitro-phosphate, 229, 266, 307, 344; gas water as, 395; phosphate of lime as, 409; superphosphate of do. as, 381, 493, 573, 604, 633, 634, 750; Parr on, rev., 444; fish as, 492; urine as, 582; burnt clay as, 698; adulteration of, 731; farm-yard, 779; salt as, 859
Markets, Prussian food, 669
Marl, use of, 25; and marling, 121; how to know, 309
Marryat's Mountains and Molehills, rev., 103
Martin Doyle's Lesson Book, rev., 605
Mason's, Mr., Visit to the Azores, &c., 516
Masson's dried vegetables, 151, 174, 190

Pine beetle, 612
Pipes, to clear choked, 421; irrigation by, 570, 586, 604
Pitcher plants, 549
Pits, Mr. Philpott's, 725; Heywood house, 743; Melon, 760; Cucumber, 776; turf, 659, 854.
Plants, new, 4, 20, 53, 84, 116, 132, 152, 173, 205, 241, 301, 316, 344, 356, 372, 404, 420, 453, 484, 516, 564, 580, 596, 612, 629, 644, 724, 740, 756, 788, 804, 852; soft, to fumigate, 7; Mr. Loddiges', 39; food of, 76; in dwelling-houses, 118; effects of the frost on, 115, 153, 154, 207, 242, 260, 278, 315, 364; tepid water for, 153; fibrous of India, 204; for baskets, 208; bedding for long borders, 281; hardiness of, 388, 533; do. of Chinese, 318; Loudon's Encyclopædia of, rev., 338; and bottom heat, 356, 390; spring flowering, 358; stealers of, 358; vinegar, 336, 357, 390, 632; nursery names of, 389, 406; vital force of, 435; nectar-secreting organs of, 487; Himalayan, 515; pitcher, 549; scarce British, 567; specific do. of, 315; and artificial heat, 582; importance of air to, 595; Mrs. Lawrence's, 632; lifting, 662; growing of, in mines, 663; sap of, 694; and electricity, 708; hedge, 713; production of, 725; textile, 853
Plant-houses, heating and ventilating, 518, 533
Plantations, Oak, 117; in Wales, 776
Planting, 581, 597, 598, 629, 645; of grain, 124, 780; Artichokes, 189; Shallots, 222; evergreens in peat, 222; Strawberries, 504; Tulips 712; pruning fruit trees during the first year of, 86; Larch, 759
Platyloma Browni, 388
Pleuro-pneumonia, in cattle, 7108
Plough, and its uses, 109, 1 9, 666; steam, 322, 345, 364, 634, 652, 780, 781' 796; Fisken's, 683, 700, 731, 810
Ploughing in snow, 123; and steam cultivatio 267, 570; Wheat without, 747; in line, 781

Plums, little known, 661, 693; double, 692; Columbia, 693; American, 726
Podolobiums, 5
Poinsettia pulcherrima, 38
Polyanthus, in pots, 40
Polygalas, 372
Polymachinon, Gymnastic, 488
Polypodium (Arthropteris) filipes, 388
Pomatum, 759
Pond, to bottom, 469, 486
Poplar, Black Italian, 104, 317, 502, 759; Lombardy and do., 175; and varieties of Larch, 726
Portugal, Vine disease in, 773
Portulaccas, treatment of, 136
Posoqueria revoluta, 173
Potash, sulphuret of, and mildew, 403
Potatoes, cattle, 19, 318; Fluke, 55, 174; substitutes for, 76; Lapstone, 175; autumn-planted, 206; at the Cape, 262; not hurt by frost, 262, 281; and tar, 301; curl and dry rot in, 334; Bennett on, rev., 493; culture of, 522; returns respecting the state of crops of, 553, 554; digging, 556; growing, 572, 588; "calico" v. disease, 598; method of cultivating, free from disease, 677; value of haulm of, 700; seedling, 710; digging machine for, 734; produce of a, 781; crops, sound, 778; in bread, 828; produce of, 828; sweet, 820, 839, 854; in peat, 854
Potato disease, 565, 662, 837; Malam's observations on the, 300; in Wales, 373; in Essex, 550
Potato sets, roasted, 190
Pots, ornamental hanging, 6; Pansies in, 39; Polyanthuses in, 40; ill effects of keeping Conifers in, 281; Chinese flower, 357; layering, 420; new garden, 453, 470; Vines in, 822
Potting, lifting plants from the open ground for, 662
Poultry, 162; keeping, 14; dairy, 124; common, 370; profits of, 429; pigeons, 123; laughing do., 211; manure, 250; value of dung, 290; entries at the Agricultural Society's meeting, 524; cure for gapes in, 606; to fatten, 619, 635, 650, 667; Shows, Bath, 412; Anerley, 589
Preserve, and copper vessels, 241
Preserving, Pear seeds, 54; vegetables, 23, 151, 174, 190; fruit, 456
Primrose, Chinese, 7, 23
Pritzell's Iconum Botanicarum Index, rev., 338
Protections, wall, 24, 336, 373, 677; straw, 135; snow, 100, 134; spring, 189, 239, 302, 317, 389, 406, 502, 518; for frames, 773, 775; for borders, 821
Pruning, fruit trees during the first year of planting, 86; Gooseberries, 102; Nut bushes, 153
Pruning knives, 206, 222
Prussia, food markets of, 669
Puddling, 568; ineffectual, 469, 486
Pulmonaria officinalis, 456
Pumpkins, 803
Pusey (Mr.), illness of, 58; death of, 473
Pycnopteris Sieboldi, 468
Pyracantha, 582

Q.

Quercus, lamellosa, 516; sessiliflora and pedunculata, 728, 742, 756, 790, 803, 821, 824, 835, 854
Quick, to sow, 806
Quince stocks, Pears on, in Mississippi, 6

R.

Rabbits, to prevent from barking trees, 88
Radishes (Raphanus sativus), 680
Rain, in Devon, 6; Dorset, 22; Dumfriesshire, 38; in Itchen Abbas, 87; at Rothamsted, 134; at Cirencester, 154; in Herts, 175; at Witham, 190; amounts of, 381; fall in July, 525, 533; shell, 711, 726, 743, 758, 789, 821
Rain guage, farmer's, 411, 461
Ranunculuses, to water, 359; culture of, 727
Rape-cake, poisonous, 42; Mustard-cake sold for, 73, 158; as food, 179
Raspberry, yellow, 154
Raspberry seeds, Dorchester, 739
Rats, water, 135; trap for, new, 453, 486
Reaping machines, 13, 507, 652; Australian, 141; trial of, selected at the Agricultural Society's meeting, 589, 635, 649, 651; competition at Stirling, 618
Red spider, 488; cure for, 24; and French Beans, 38
Reproduction, Mann on, rev., 534
Rheum nobile, 516, 565
Rhododendrons, grafted, 6, 20, 22, 38, 53, 70, 86, 102, 118, 134, 154, 502; soil for, 54; standard, 69; glaucum, 119; hardy, 424; hardiness of hybrids, 154; seedling, 173; hybrid, 190, 206, 317, 390; citrinum, 205; Edgworthi, 262; Dalhousiæ, 373; Brookeanum, 404; javanicum, fruit of, 486; Falconeri, 550
Rhubarb, to force, 208, 242, 728; and Seakale, 262
Rice fund, 140
Roads, good, 12; economy and cost of do., 396, 412
Robinia pseud-Acacia, 249
Rollisson's (Messrs.) nursery, 223
Rondeletia anomala, 756
Roofs, brick arches v. tiled, 123; iron v. slate, 813
Rooks, food of, 363
Roots, machine for grating, 60; v. Beans, 108; Seakale, 134; excrescences on Cucumber, 220; in drains, 228, 268, 363; adventitious, 335; on the stems of Vines, 358, 454; transport of, 852
Root crops, culture of, 228, 249, 796; finger and toes in, 572, 804, 810
Rope, made from Hollyhock, 456
Roses, mildew on, 86; manure for, 264; treatment of young, 317; in beds, culture of, 709, 727, 743
Rose stocks, 680
Rotation of crops, 91
Rothamsted gathering, 491
Royal Botanic Gardens, Kew, 280, 583; consumption of fuel at, 86, 102, 279; Dr. Hooker's appointment in, 451; Cactus house at, 486
Royal Forests, 51, 85, 132, 133, 220, 221, 320, 334, 358, 700, 732, 758
Royle on Fibrous Plants of India, 204
Rucker's (Mr.) garden, 338
Rumex vesicarius, 372
Russia, Books on, rev., 39; Tegoborski on the Productive forces of, rev., 243; north region of, 408; cattle disease in, 443, 475
Rye-grass, Italian, 285; to sow, 29, 781; Mr. Telfer's, 57, 158; Morton on, 158, 177; seed, 210; weight of do., 211, 213; North country farmer's opinion of, 267: Dickinson on, 380

S.

St. James's Park, road across, 629, 643, 645, 675; sketch of do., 676
Salix Babylonica var. annularis, 726
Salt, for Asparagus, 56, 504; and lime, 61; for Gooseberry caterpillar, 540; a fixer of ammonia, 665, 700, 732; bacon to, 702; its uses, 849
Salt water, effect of on seeds, 242, 278, 356, 580
Salt water aquaria, sea-weed for, 599
Salter's (Mr.) nursery, 679
Salvia splendens, 241
Samphire, 281, 303, 317, 336
Sandiway Farm, 861
Sand drainage, 268; hills, cultivation of, 717
Sap, in plants, 694
Sarracenia Drummondi, 302
Savings Bank, Marylebone, 475, 812
Scale, mussel, 837
Schools, reformatory, 288; gardens for, 538, 572, 714; Martin Doyle's Village Lesson Book for, rev., 605
Science, unity of, 535
Scillas, 357
Scotland, Arboricultural Society of, 100, 135; winter in, 135, 153, 190, 222; Pear culture in, 174; agricultural statistics of, 106, 180, 211, 227; number and sizes of farms in, 227; pipe irrigation in, 570, 586, 604; Edinburgh, 339
Scripture, Tares of, 454
Seakale, old roots of, 134; from seed, 174; and Rhubarb, 262
Sea-water, and seeds, 242, 278, 356, 580, 773, 789; preserving of, in a healthy state in salt aquaria, 535
Sea-weed, for salt water aquaria, 599
Seeds, to pack, 24, 744; Pears, to raise from, 21; do. to preserve and sow, 54; Broccoli, 70; Seakale from, 174; Italian Rye-grass, 210; weight of do., 211, 213; and sea water, 242, 278, 356, 580, 773, 789; Cauliflower, to sow, 262; sowing and earth temperature, 260; for the Crimea, 318; Forbidden fruit, to get, 533; Shaddock, to get, 533; Pæony, to sow, 600; Californian Laurel, to sow, 600; Laurustinus from, 614; Astragalus, 632; American, 648; Cotton, oilcake from, 698; Australian, to sow, 696; Raspberry, Dorchester, 739; vitality of, 739, 743, 758, 773, 805, 837, 854; resuscitation of, 741; Turnip for, 765; transport, 852
Seeding, thin, 12, 620, 637, 732, 763; thick and do., 227
Senecio mikanioides, 84
Sewage, 91, 157, 161, 193, 196, 209, 212, 506

COUNTY OF GLOUCESTER AND CHELTENHAM ROYAL HORTICULTURAL SOCIETY.—The days fixed for the Exhibitions of the above Society for 1855 are WEDNESDAY, May 9; WEDNESDAY and THURSDAY, June 6 and 7; and WEDNESDAY, September 5.—Schedules may be obtained on application to HENRY J. COCHRANE, Secretary.
11, Colonnade, Cheltenham, Jan. 6.

GARDENERS' BENEVOLENT INSTITUTION.
SEVENTH APPLICATION.
HENRY SCHNEIDER, of Ford, Colerne, Chippenham, through his Advertisement, again appeals to the sympathy and kind support of the Subscribers of this Institution, being now 90 years of age, and in very destitute circumstances. His testimonials remain unimpaired, and he is encouraged to make another application to his kind friends who have hitherto favoured him with their votes, and other subscribers who will charitably lend him their aid at the forthcoming election in January next.
The following gentlemen will be gratified in receiving proxies in his favour:—Mr. Gregory, Cirencester, Gloucestershire; Mr. Burbank, Grittleton, Chippenham, Wilts; Mr. Spencer, Bowood, Calne, Wilts; Messrs. Garraway, Mayes, & Co., Bristol; Mr. Trotter, Badminton, Chippenham, Wilts; Messrs. Arthur Henderson & Co., Pine Apple Place, and John Arthur Henderson, Esq., 64, Hamilton Terrace, London.

GARDENERS' BENEVOLENT INSTITUTION.
FOURTH APPLICATION.
WILLIAM THACKER begs earnestly to appeal to the subscribers, through the medium of an advertisement, from his total inability to incur, for the FOURTH TIME, the heavy expense of issuing circulars. He is aged 68, and he rests his claim to their benevolence on having been 50 years a gardener and five years a subscriber to the Institution; and that both his wife and himself are totally incapacitated, through infirmity, from supporting themselves. His case is strongly recommended by Mr. Alex. Dancer, Fulham; Messrs. J. & C. Lee, Hammersmith Mr. T. Gaines, Battersea; Mr. Barto Chaundy, Lewisham.

WANTED, 15,000 large strong QUICK, not less than 3 feet in height.—Address, post paid, stating full particulars as to price, &c., to S. H., Post Office, Great Missenden, Bucks.

WANTED, HOTHOUSE GRAPES, both Black and White. Gentlemen, gardeners, &c., having any to part with, will find an immediate purchaser for them, at good prices. Address, LEWIS SOLOMON, Covent Garden, or Crystal Palace.

TO BE SOLD, very reasonable, 10,000 or more GOOSEBERRY AND CURRANT TREES, strong plants; also a great variety of ORNAMENTAL FOREST TREES, from 8 to 12 feet high; LAURELS, Bushy LAURESTINES, &c.—Apply to Mr. C. CLARK, 179, Windmill Street, Gravesend, Kent.

AMERICAN APPLE TREES.
TO BE SOLD, from 800 to 1000 very superior AMERICAN APPLE TREES. The Trees were raised from seed, and grafted in America, and imported four years ago. To parties about to plant Orchards this is an opportunity rarely offered.—To view the Trees and to treat, apply to J. GREGORY, Yardley Gobion, near Stony Stratford, Bucks.

MANGOLD WURZEL SEED.
TO BE SOLD, LONG RED and YELLOW GLOBE, growth of 1854, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

JAMES CHARTRES AND CO. beg to announce that they have added a NURSERY to their Seed Establishment, and are now prepared to supply FRUIT TREES, PLANTS, &c. of every description, all of finest quality, and at moderate prices. —York Nursery, Hanger Lane, Stamford Hill; and 74, King William Street, City, London.—Jan 6.

GENUINE SEEDS.
JAMES CHARTRES AND Co. beg to inform their patrons and purchasers of Seeds generally that their unrivalled Stock is now arranged, and they earnestly solicit early orders, as many choice articles are deficient in quantity this season.
Seed Warehouse, 74, King William Street, City, London.

GOLDEN DROP GREEN FLESH MELON.
J. CHARTRES AND CO. have succeeded in saving a limited quantity of Seed of this splendid variety, which they can with confidence recommend; it is of moderate size, oval shape, and beautiful gold colour. Six Seeds 2*s*. 6*d*.—Seed Warehouse, 74, King William Street, City, London.—Jan. 6.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their Stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out.
Their Seeds may be fully relied on as being in every respect of first-rate quality, and true to their sorts. Catalogues may be had on application.—Pine Apple Place, Edgeware Road, London.

GREAT NOVELTIES FOR THE ENSUING SEASON,
FUCHSIAS WITH WHITE COROLLAS.
LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—
FLORENCE NIGHTINGALE.
Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.
GALANTHIFLORA-PLENA
(The DOUBLE Snowdrop Corolla'd Fuchsia.)
Pure double white corolla, resembling a fine large double snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10*s*. 6*d*. each.
The usual discount to the Trade when three or more are taken.
Exeter Nursery, Exeter.—ESTABLISHED 1720.

EARLY DANIEL O'ROURKE PEAS.
J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

NEW CAULIFLOWER.
WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s*. per lb.; smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

CAMELLIAS.
CHANDLER AND SONS beg to inform their friends and customers that they have a large stock of young CAMELLIAS this season, beautifully set with flower buds, and now in a fit state to travel without injury. Fine plants, 30*s*. and upwards per dozen.—Wandsworth Road, Vauxhall.

RHUBARB ROOTS for FORCING or PLANTING. —Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s*. per doz.; HOWARD'S PRINCE ALBERT, 12*s*. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford, Jan. 6.

SEED WHEAT.—Samples and Prices of RED HYBRID, NURSERY, and other kinds of Wheat from the CHALK, sent on application to Mr. H. RAYNBIRD, Basingstoke.
The Red Hybrid and Nursery are well suited for late sowing after Turnips.

NEW SEEDS JUST HARVESTED *can now be obtained of the most genuine description, from* WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

LYNCH'S STAR OF THE WEST CUCUMBER, *the best frame variety in cultivation. For description, see* RENDLE'S "*Price Current and Garden Directory*" *for* 1854.
Price 1*s*. 6*d*. and 2*s*, 6*d*. per packet.—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

DIOSCOREA BATATAS—THE NEW CHINESE POTATO.—This new esculent was fully described by Professor Lindley in the *Chronicle* of December 23, 1854.
The Subscribers are now importing a choice lot of Roots, and can supply them on the following terms:—

Four Tubers	£0 10 0	Fifty Tubers	£5 5 0
Ten „	1 2 6	Hundred „	10 0 0

First Orders will have the best Roots.—Apply to
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

CHARLES SHARPE AND CO.'S Wholesale Catalogue of Seeds is now ready, and may be had on application.

DIOSCOREA (JAPONICA) BATATAS, NEW CHINESE POTATO.—A choice list of imported roots of the above. Price to the trade on application.
Nursery and Seed Establishment, Sleaford.

CHARLES SHARPE AND CO. beg to draw the attention of the nobility, gentry, and clergy to their superior collection of Seed Potatoes, which they can recommend as decidedly the best in cultivation. Price per bushel, of 4 stones:—

Early Ash-leaved Kidney	9*s*.	Early Emperor	9*s*.
„ do. do. Jackson's	9*s*.	„ Cockney	9*s*.
„ Round Frame ...	9*s*.	„ Oxford	9*s*.
„ Martin's Globe ...	9*s*.	„ White Rough ...	8*s*.
„ King's	8*s*.	„ Foxe's Seedling ...	9*s*.
„ Hen's Nest... ...	10*s*.	„ American Native ...	8*s*.

FOR LATE PLANTING:—
Yorkshire Regent, 7*s*. | Prince Regent, 7*s*. | Fluke Kidney, 8*s*.

DIOSCOREA (JAPONICA) BATATAS, NEW CHINESE POTATO.—This was described in the *Gardeners' Chronicle* of December 23, which see for mode of cultivation, &c. Price, per root, 2*s*. 6*d*.; per dozen, 24*s*.
Nursery and Seed Establishment, Sleaford.

EARLY SEED POTATOES.—Jackson's Improved Thorough High-bred Early Ashleafs, price 9*s*. per bushel, and the celebrated Short-tops, 7*s*. 6*d*., are unequalled for quality and yield; they by far surpass the "old stock," which is generally a sluggish bearer. British Queens, 7*s*. 6*d*., the earliest round variety, known; Early Frame and Ashleaf Seedlings, 8*s*.; Regents, from prepared cuttings, 6*s*. Free to London; no charge for sacks. All orders must be accompanied with a remittance.—JOSEPH WILSON, Seedsman, Ipswich.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.
To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

SUTTON'S PRICED SEED AND PLANT LIST WITH INSTRUCTIONS ON CULTIVATION, CALENDAR OF OPERATIONS, and other Useful Information is now published, price Sixpence; and being entered at Stationers' Hall is copyright.
As this publication is compiled principally for the use of Messrs. SUTTON'S CUSTOMERS, it is requested that those who have not yet received it will forward their Address, when a copy will be sent gratis, and post free. Other persons will receive it post free in return for six postage or receipt stamps.
Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SEEDS FOR THE FARM.
SUTTON'S PRICED LIST will be seen on the last page of the present number of this paper.
Early orders are requested and recommended.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY for 1855 *is now published, price* 6d.
To be had of all Booksellers, and from
WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth.*

VEGETABLE AND FLOWER SEEDS.
J. DOBSON AND SON'S New Catalogue of Kitchen Garden and Flower Seeds is now ready, and may be had on application.—Woodlands Nursery, Isleworth.

PRICED NURSERY CATALOGUES.
A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM BARRATT, Wakefield.
☞ A quantity of fine Transplanted White Thorns.

FOREST AND ORNAMENTAL TREES AND SHRUBS.
DAVID REID AND SON, NURSERYMEN AND FLORISTS, Leith Walk, Edinburgh, beg to intimate their CATALOGUES as above are ready, and to be had free on application.

EXOTIC NURSERY, CHELSEA.
JAMES VEITCH, JUN., will be happy to forward his new Retail VEGETABLE, AGRICULTURAL, AND FLOWER SEED LISTS on application, and desires to assure those who may kindly favour him with their orders, that he has spared no pains in procuring his supplies from the first growers on the Continent as well as in this country, and that he will use his best endeavours to give his customers entire satisfaction.

SEED GROWERS' SOCIETY.—The Members of the above Society are now prepared to send LISTS of AGRICULTURAL, GARDEN, and FLOWER SEEDS to those who are desirous of having them genuine and direct from the Growers.—Applications addressed to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex, will meet with prompt attention.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.
P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

GERMAN FLOWER SEEDS.
MOSCHKOWITZ AND SIEGLING, Erfurt, beg to inform the trade that their new Wholesale Catalogue of Choice German and other Flower Seeds, is now ready, and may be had on application to their Agent, Mr. H. HENKEL, 70, Fenchurch Street, London.

AMERICAN PLANTS.
JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.
The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.
WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

AMERICAN NURSERY.
GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.
G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

NEW WHITE PHLOX.
PLANTS EARLY IN MARCH.
J. DOBSON AND SON beg to announce that they are in possession of the entire stock of a new WHITE PHLOX, named Omniflora compacta from its profusion of bloom and exceedingly dwarf habit. It was exhibited at the National Floricultural Society, Sept. 7, 1854, when it received a Certificate of Merit. As a bedding plant it will be a great acquisition from the scarcity of white flowers of this class; planted in beds with Scarlet Geraniums it has a very pleasing effect. The following report is given of it in the "National Almanac" for this year:—"A white, of dwarf habit, very compact; the flowers rather small, of good shape and substance; strongly recommended."
Extra strong plants in March, at 3*s*. 6*d*. each.
Woodlands Nursery, Isleworth.

TWO NEW CUCUMBERS.

SIR COLIN CAMPBELL AND GENERAL CANROBERT.

THE ABOVE are two of the Finest and most Superb New Hybrid Cucumbers ever yet sent out for Exhibition, Winter Cultivation, and every other purpose for which a Cucumber is required.

SIR COLIN CAMPBELL CUCUMBER.

The above Cut is an exact representation of one of the fruit grown this summer, which measured exactly ten of its diameter long, being 25 inches, with not more than half an inch handle. It is a splendid Black Spine, of a dark green colour, and free from ribs or shrivels; grows very quick, sets free, and carries its bloom well. As a Cucumber for Exhibition nothing can surpass it, and is very prolific, often throwing out four or five fruit from every joint, and the vines are short jointed. The fruit is solid, and eats very crisp, and for market it keeps its bloom well for many days, not turning colour at the stem or point as most varieties do Fruit was cut from the above in January last, and the same plants continued to produce fine fruit until the end of October.

GENERAL CANROBERT CUCUMBER.

This is also a most superb variety for winter cultivation, for which it is best adapted, being a hybrid from Lord Kenyon's Favourite and Phenomena. It has a great advantage over Kenyon's in length, growing to about 18 inches in the same time in which Kenyon's will grow 12 inches; it is equally as hardy and productive. Of a dark green appearance, Black Spine, and a free setter; fruits freely during the whole of the winter, and always grows a very even size from stem to point. It will swell off two or three fruit at a time on a plant, during the depth of winter, and carry them out well, which it does with less heat than any other: this has been proved when several varieties have been grown together, this having the coldest part of the house. The object of the raiser of the above superb varieties has been to obtain perfection and hardiness, in which he has succeeded, by continually hybridising different varieties.

Sold in Packets of Five Seeds, 3*s.* 6*d.* each, or 1 Packet of Sir Colin Campbell and General Canrobert for 6*s.*

The following fine varieties of Cucumbers and Melons, which have been thoroughly proved and have given the greatest satisfaction to all Purchasers, can be supplied.

CUCUMBERS.

Captivation	2*s.* 6*d.*	Hunter's Prolific ...	1*s.* 0*d.*
Phenomena	2 6	Mills' Jewess	1 0
Lord Kenyon's	2 6	Cheltenham Surprise ...	1 0
Essex Hero	2 0	Manchester Prize ...	1 0
Victory of Bath	1 0	Sion House True ...	1 0
Gordon's White Spine ...	1 0	Cuthill's Black Spine ...	1 0
Sunderland Wick ...	1 0	Conqueror of the West...	1 0

MELONS.

The Queen	1*s.* 0*d.*	Beechwood	1*s.* 0*d.*
Bromham Hall	1 0	Windsor Prize	1 0
Incomparable	1 0	Emperor...	1 0
Golden Ball	1 0	Fleming's Hybd. Persian	1 0
Bowood	1 0	Blackall's Green Flesh	1 0
Victory of Bath... ...	1 0	Bailey's "	1 0
Camerton Court ...	1 0	Snow's Hybrid	1 0

A Packet of either of the Melons will be given to all Purchasers of the two new Cucumbers advertised above.

A Remittance must accompany every Order by Cash or Penny Postage Stamps, and the whole, or any part (as the case may be), will be immediately forwarded.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST,
14, Abbey Church Yard, Bath, Somersetshire.

The New Chinese Potato, Dioscorea (Japonica) Batatas.

MR. JOHN HENDERSON,

Formerly of the Firm of JOHN A. HENDERSON & Co., Pine Apple Place, London,

HAS the pleasure of informing the Public that he has just completed the Purchase from M. PAILLET, of Paris, of his entire Saleable STOCK of the above introduction from China, the nutritive properties of which are said so far to surpass the ordinary Potato that it is likely, not only to act as an auxiliary, but entirely to SUPERSEDE that valuable but uncertain esculent.

The most satisfactory results have followed from personal experiments, and proved that when cooked in the ordinary manner, from the large amount of FARINACEOUS properties it contains, it can NEVER become waxy, as is too generally the case with the Potato. Its FLAVOUR resembles in delicacy an early ASH-LEAVED KIDNEY; but, independent of the above excellent qualities, there is every probability of its taking a still more important position in the ECONOMY of this country, for, when dried and reduced to powder, it is equal to the best ARROW-ROOT; or mixed in the proportion of one-third with two-thirds of wheaten flour, it makes an extremely light and wholesome BREAD, as well as very superior PASTRY.

Messrs. VILMORIN & Co., speaking of it, observe:—"Of all the esculent roots proposed as substitutes for the diseased Potato, the DIOSCOREA JAPONICA is certainly the only important one. It is easily propagated. The tubers are large and long, the flesh very mealy and devoid of any peculiar or disagreeable flavour. The DIOSCOREA JAPONICA is, in our opinion, a PRECIOUS ACQUISITION."

M. PELÉ, Horticulturist, Paris, in his Supplementary Catalogue of this autumn says:—"A new alimentary root, introduced into France by M. MONTIGNY, French Consul in China. Serious experiments have shown that this tuber will be much more advantageous to cultivate than the Potato, both in regard to its QUALITY as well as PRODUCE."

M. PAILLET, to whom the Imperial Society of Agriculture and Commerce of France has awarded the sum of 3000 francs as encouragement for having brought it into cultivation, also notices that "this tuber attains at least 1 to 2 lbs. weight. In its growth it is less delicate than the Potato, which unfortunately has of late years much degenerated. It does not require particular care, and its abundant produce amply repays cultivation. Its taste is pleasant, and being a root which contains a large amount of FARINA, will be a great addition to the FOOD OF THE PEOPLE as soon as it becomes generally known. It is so HARDY that it has passed the winters of 1853–4 in the open ground, without having in the least suffered from frost. It is also found that the STEMS and LEAVES, which are very numerous, form an EXCELLENT FOOD FOR CATTLE."

Tubers, with description of the Chinese Mode of Culture, to be obtained of MR. JOHN HENDERSON, KINGSKERSWELL, SOUTH DEVON, at the following prices, for cash only:—

4 Tubers ... ... £0 10 0 | 10 do. ... ... £1 2 6 | 50 do. ... ... £5 5 0 | 100 do. £10 0 0

Post-office orders are requested to be made payable at Newton Abbot, South Devon. The usual discount allowed to the trade when not less than 50 are taken.—P.S. All orders unaccompanied by a remittance will be considered as not received.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regent's Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

BASS AND BROWN'S NEW AUTUMN CATALOGUE, supplied free for three Penny Stamps. They have this season a very fine and vigorous stock of the finest Roses, among which are a number of very superb new Continental varieties, consisting chiefly of the perpetual class. The following selections will be highly approved,

Figs, Medlars, Quinces, Walnuts, and Mulberries, each ...	2
Filberts, new thin shelled and red skinned, per dozen ...	3
Strong Vines, from eyes and layers, in pots, per dozen ...	18

Large stock of Transplanted fine Scotch Larch and Spruce Firs, cheap.

New Gardens and Greenhouses furnished on moderate terms.

Priced Seed List for 1855 *by post.*

Albion Nursery, Stoke Newington, London.—Jan. 6.

HOLCUS SACCHARATUS, OR CHINESE SUGAR CANE.

(See GARDENERS' CHRONICLE, Dec. 30th, 1854.)

MR. JOHN HENDERSON, formerly of the firm of JOHN A. HENDERSON & Co., Pine Apple Place, London, has the honour to announce that he is prepared to supply Gentlemen, Amateurs, and Professionals, with seed of this most valuable and estimable plant.

As the Dioscorea Batatas seems well adapted to make good the deficiency arising from failure in the Potato crops, so this appears admirably calculated to meet many wants of the present day. That it may be used for the purposes of distillation, and may thereby preserve the grain of the country, is not less certain than that the leaf and stem (after the saccharine matter has been extracted) contain a large amount of fibre, of such a nature as can be employed in the manufacture of every kind of paper. In both these points, as well as in many others, this plant demands the attention of every Gardener and Amateur throughout the country, the more so as from the necessity that at present exists for the production of fibres that may be used in paper manufacture a good remuneration may be fairly expected by growers, even after the plant has, so to speak, paid itself by the saccharine matter extracted from it.

Mr. HENDERSON hopes, in a few days, to have ready for the press a more lengthened account of this plant, as well as a complete statement of the latest experiments in connection with the Dioscorea Batatas. As there are many varieties of the Holcus, W. J. H. can only be responsible for seed forwarded by himself, which he is prepared to do in sealed packets, at 1*s.*, 2*s.* 6*d.*, 5*s.* and 10*s.*, according to quantity.

Orders to be accompanied with a remittance to Mr. JOHN HENDERSON, Kingskerswell, Newton Abbot, South Devon.

P.S. Price to the Trade can be had on application.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 feet
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen, growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucaria, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of the American Plants, Roses, and Nursery Stock in general.

SUTTON'S SHORT SEED LIST.—ON THE LAST PAGE *of the present Number of this Paper will be seen a concise List of the leading kinds of Seeds, which it is hoped will be found convenient to Gentlemen writing out their Seed orders.*

Early commands will have the preference of scarce sorts.

SUTTON & SONS, Seed Growers, Reading.

SUTTON'S COMPLETE COLLECTIONS, CARRIAGE FREE.

PARTICULARS of the SORTS and QUANTITIES contained in SUTTON'S Collections of Seeds will be sent post free on receipt of a stamped envelope with address.

By the perusal of this List, it will be seen that the very best kinds of Vegetable Seeds may be obtained in full quantities, and proper proportions for one year's supply of a large garden for the sum of 3l., and other complete Collections of equally choice sorts for smaller Gardens at 2l., 1l. 5s., and 15s. The economy of cost is by no means the only advantage gained by ordering one of these Collections.

Address, JOHN SUTTON & SONS, Seed Growers, Reading.

RENDLE'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready. They can be had to suit various sized Gardens at the following prices:—*

No. 1 COLLECTION	... ...	£3 0 0

CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post for 9 stamps.
Price per lb. to the Trade on application.

The Gardeners' Chronicle.

SATURDAY, JANUARY 6, 1855.

FOR some time past it has been known that the Council of the HORTICULTURAL SOCIETY had it in their contemplation to introduce very considerable changes into the meetings both in Regent Street and at Chiswick. We have not, however, felt at liberty to introduce the subject until the plans had been finally settled. The Society having at length announced its intentions, we are now able to say with certainty what they are.

It appears that the number of meetings in Regent Street is to be six only: the months of November, February, March, April, May, and June being selected, and that upon each occasion the subjects of exhibition are to be collected upon a scale approaching that of the Garden Meetings, as far as the space to be found in a London house may permit. In connection with this plan, it is proposed that the objects of exhibition shall be open to inspection for four clear hours in the months of February, March, and November, and for five clear hours on other occasions. A schedule of objects, the production of which the Council are ready to reward, is provided for each day of meeting, so as to enable gardeners entering into competition to be prepared beforehand, and also to render each meeting a horticultural illustration of the advancing season. In making the arrangements for these as well as for the Garden Meetings, the Council have received the active assistance of Mr. INGRAM, of the Royal Gardens, Frogmore, of Mr. FLEMING, of Trentham, of Mr. SPENCER, of Bowood, and of Mr. DAVIDSON, of Shrubland Park, under whose advice the classes have been settled and the amount of prizes determined. The co-operation of gentlemen of such acknowledged horticultural eminence cannot fail to be regarded as a guarantee that the best interests of the Society and the public have been consulted.

But so far as the meetings in Regent Street are concerned the objects of exhibition are by no means limited to those enumerated in the schedules. On the contrary, we are informed that the Council invite the exhibition of every valuable article connected with gardens, which may be either remarkable for novelty or intrinsic excellence, and that the merits of such objects will be recognised as far as the funds of the Society will allow. Among the unenumerated articles which are more particularly pointed out are Ornamental Plants, and Useful Fruits or Esculents of all kinds, Models of Improvements in Horticultural Buildings, Improved Garden Implements, and whatever contributes to Garden Decoration. The Council will also be glad to encourage the production of examples illustrating the operations of Arboriculture, whenever they are calculated to throw light upon either the theory or practice of that important branch of rural economy, or upon the quality of British-grown timber. To this are added, Raw Materials from the Vegetable Kingdom useful in Arts, Manufactures, or as Food (Agricultural produce excepted), whether of home or colonial growth. Even Honey in the Comb is not excluded, as it has hitherto been.

It must be owned that this is a very extensive scheme, but we think not more so than may be expected from a corporation chartered "for the improvement of Horticulture in all its branches, ornamental, as well as useful." These words, which are taken from the charter of incorporation, plainly show that in the minds of the advisers of the Crown, when the charter was granted, purposes of utility were to be placed before those of ornament; by now including them on equal ground, the Society is working out the main objects for which it was instituted. Its career opened with an almost exclusive attention to subjects of utility; at a subsequent period ornamental gardening received the greatest encouragement; of late years both have been combined, but we have never before seen objects of utility placed by the Society in so prominent a position. Arboriculture and the Raw Materials of Manufactures! how extensive a field of inquiry do these two subjects occupy, and of what great importance to mankind.

The greatest uncertainty exists as to the real value of even our own wild Oaks, to say nothing of the effect produced upon the commercial value of timber by different modes of cultivation; little or nothing is known of the real quality of the timber produced by the numerous coniferous and other trees introduced to cultivation during the present century; and even as regards some of the timber trees wild in Europe, there is scarcely any satisfactory evidence concerning the influence produced upon the quality of many of them by climate, soil, or situation.

So with regard to textile materials, or substances of a similar nature. The consumption of such articles has become so enormous that the gravest social questions are connected with an abundant or deficient supply of materials, to which, a few years since, small importance was attached. The supplies, for instance, of Hemp have become so insufficient for the wants of manufacturers, even in periods of political tranquillity, that recourse is already had to the importation of many other substances, and there is no doubt that the existing demand will hereafter be greatly increased. It is, therefore, a question of the highest public importance, whether more skilful cultivation may not be applied to the crops of textile plants already cultivated among ourselves, so as to augment produce without deteriorating, if not improving quality; whether new kinds of plants are not at least as suitable to our climate as those already grown among us; and, most especially, what of the innumerable species inhabiting our foreign possessions, of which at present little is known to science and nothing to commerce, can be the most profitably introduced to notice, whether by cultivation in the climates that are natural to them, or by mere collection in the wild state.

Cotton offers a still more striking instance of the pressing necessity of this investigation, and of further attempts being seriously made, not only to improve its quality in those British colonies which already produce it, but to introduce it to others which have not been hitherto thought suitable to such a crop. Of course we do not overlook the extensive experiments that have been made by the East India Company—experiments worthy of so great a body; but it is greatly to be wished that such attempts should not only be continued in India, but imitated wherever circumstances are favourable to the operation.

Another class of plants consists of those which can be employed in the manufacture of paper. Raw material for this purpose is already becoming so scarce that even straw is largely employed in the absence of a more suitable substance. Nevertheless, we are perhaps surrounded by plants whose fibre may be advantageously converted, although we are at present ignorant of their possessing the properties required by the paper-maker. It is possible that such plants might be profitably cultivated; it is still more possible that the refuse of certain branches of cultivation may have a market value now unsuspected; and it is at least certain that our tropical colonies abound in the requisite substances, now wild and unrecognised, but susceptible of ready collection or cultivation.

Upon these grounds we feel persuaded that the proposals now made by the Council of the Horticultural Society will meet with support, and that they will eventually enable us to know with certainty what our home or colonial capabilities really are, either in the state of unaided nature or under the direction of intelligent cultivators. The public exhibition of results, and a recognition of merit by the distribution of medals and rewards, appear to offer the most ready means of effecting this very desirable object.

If from the consideration of the plan for extending the importance of the meetings in Regent Street, we turn to those great assemblages now called Garden Meetings, we find that material changes are there also made, although upon different grounds. In the first place they are to be held on Wednesdays instead of Saturdays. We are, moreover, informed that "the coldness of our spring weather, and the backward state of vegetation, have of late years rendered the Society's Garden so little attractive is the early part of May, that the Council have been anxious to find some place near London in which the first meeting can be held instead of Chiswick; and they announce officially that Her Majesty's Commissioners for the Exhibition of 1851 have most obligingly placed the grounds of Gore House at the disposal of the Society, in consequence of which the great meeting on Wednesday, May 16, will be held in that garden instead of Chiswick." This will, we imagine, be found a very satisfactory arrangement. The grounds belonging to the Royal Commissioners at Kensington Gore are very conveniently situated, and well adapted to the proposed purpose; and it must be owned that to drive five miles from Hyde Park Corner to see an exhibition in a garden when the trees are not in leaf, and all that renders such a place most attractive is necessarily absent, does seriously task the zeal of the admirers of Garden Meetings and Chiswick flower shows. In June and July the exhibitions will be held in the Garden of the Society as heretofore.

We observe with pleasure that the Council have contradicted as follows an unfounded report, to which we adverted some months since:—"It has been confidently asserted within the last two years that the Society is about to abandon its Garden. Such a statement is wholly without foundation. The Garden is held of His Grace the Duke of Devonshire upon a lease, which does not expire till Michaelmas, 1881. It seems almost unnecessary to add that if it had been the intention of the Council to surrender the Garden, the Fellows of the Society would have been immediately acquainted with the fact, and not left to derive their information from common rumour."

Such is the substance of the announcement that has just been made. To borrow once more the words of the Council:—"The Society has now existed as a corporate body for forty-five years, during which period it has constantly promoted the interests of Horticulture to the utmost extent of the means at its disposal. A very large proportion of the finest exotic plants and fruits now common in our Gardens has been introduced by its collectors. A distinguished naturalist (M. Botteri) is at this time engaged in exploring the rich vegetation of Orizaba, and his contributions, which have already begun to arrive in England, will speedily be in course of distribution." We therefore trust that, even amidst the din of arms, this great national institution will be so supported that it may continue to remain what it has hitherto been, the most distinguished association of its class.

THERE is a letter in our pages to-day, signed T. R., on the cost of digging at Lois-Weedon; and we have inserted it,—not because we regard the writer's objection as sound or his practice either good, or like that of Lois-Weedon, but simply as a vehicle for a few words of explanation on a point which is generally useful to the cultivator of the soil.

The writer states his practice to be to dig his clay land two spits deep. He does not state the depth of his staple; but, taking it at the outset to be 6 inches, and each spit to be 10 inches, he digs 20 inches deep at once, bringing up 14 inches of the raw clay subsoil, which will take years and years to become pulverised and mellow, and fully productive; and for this comparatively unproductive operation he has to pay the heavy penalty of 8*l.* per acre.

Let him mark the difference of the practice at Lois-Weedon, and he will no longer wonder at the difference in the cost. The rule laid down in the "Word in Season to the Farmer" is "to bring up only 4 or 5 or 6 inches of the subsoil, according to its nature, whether tenacious or loamy or light. To bring up more at the outset would be *a wasteful and injurious expense*" (p. 53, 13th ed.). And the reason for that rule, with reference to heavy land especially, is that it may have time during the year's fallow to become mellow and productive for the succeeding crop; that its mineral elements of fertility may become gradually soluble; and that its

texture may be changed from cohesive clay into friable mould.

To follow this rule, then, in the case of a ploughed staple of 6 inches, only 4 inches of heavy subsoil are to be raised at the outset, and the depth altogether, either at two shallow spits of 5 inches each, or at one full spit, will then be 10 inches. The cost, then, at the outset, of digging this one spit will be about 60*s*. the whole acre, or about 30*s*. the half acre—a price which, of course, will vary a few shillings under special circumstances in the condition of the soil, and according to the employer's knowledge of the value of labour.

At the next digging another inch of subsoil is to be raised, and as the first 10 inches will now be pulverised by constant stirring and exposure, this second easier digging can be accomplished without raising the price; and so on, year after year, till a well pulverised depth of two full spits be attained, "beyond which it is neither needful nor convenient to go."

There are other objections to Mr. Smith's scheme of cultivation, resulting in failure; and we really think we cannot do better than lay before our readers what Mr. Smith himself says, in the preface to the new edition of his pamphlet, in a few words to those who have tried the plan and succeeded:—

"I have still a word for those who have tried the plan, *and not succeeded;* and in repeating what I have said in the former edition, I again bespeak the indulgence of those whom it may concern, wherever they may be. I reiterate, then, my declaration, which I make with great deference but with the utmost sincerity, that *I never knew an unsuccessful case where I have known the plan to have been strictly carried out.* Is it not possible then, that the obscure directions have been misunderstood, in some cases, in others unknowingly overlooked? Let me be forgiven if I presume to think it possible, and with that impression reproduce them in another form, and place them in a stronger light, clear, distinct, and tangible,—the form of question and answer; and let the unsuccessful experimenter look each question boldly in the face, and reply to it himself. Any annoyance, any distasteful recurrence to catechism, rather than stumble on in error.

"To begin with the material on which you work, put it to yourself:—

"1. 'Is it Wheat land I am cultivating,—clay or loam? If not, have I manured it? Before commencing, did I drain, clean, and level?

"2. 'In sowing, did I drop or drill my well-selected seed, *early;* and give it a solid bed.

"3. 'In digging the intervals, did I bring up only so much of the subsoil as could be thoroughly pulverised and mellowed for the succeeding crop; of clay only a few inches, of any subsoil just so much as would lose its rawness during the twelve-months' fallow?

"4. 'In cleaning the rows of Wheat and the spaces between them, did I hand-pick and hand-hoe the weeds, and keep the surface open.

"5. 'In scarifying the intervals, did I, besides cutting up and removing the hungry weeds, so time the operations of cleaning and stirring, that I fed the Wheat plant as it required it?'

"In the latter question is a high refinement in farming which has been left in the directions to the judgment of the operator. The intelligent farmer is fully aware that early in spring a well-timed application of guano or nitrate of soda is of infinite service to the poverty-stricken plant. Now, a judicious stirring of the intervals, under similar circumstances, is equal in its good effects to a top-dressing of either; just as an ill-timed and injudicious application of the horse-hoe is equal in its ill effects to a top-dressing of guano or the nitrate given without discretion; and the result of that is now well known, in late tillering, over-luxuriance, and mildew.

"There are many other questions to be responded to, but these may be considered the leading ones. One and all must be satisfied in order to full and entire success; most of them being indispensable to any success at all. And if, as judge, accuser, and defendant in one, a man confess himself unable to reply to them affirmatively, he stands convicted out of his own mouth, and I leave him to the sentence of his own honest judgment."

New Plants.

108. Catasetum incurvum, *Klotzsch in Allg. Gartenzeitung, June* 17, 1854.

The singular plant now figured was obligingly sent us last summer by the Lord Bishop of Winchester, who had purchased it at one of Warczewitz's sales, under the name of *C. secundum.* The flowers are represented by our artist of the natural size, so that they are probably the largest yet discovered among the race of Orchids. Of a dull green, streaked and stained with purple, the great blossoms resembled nothing so much as some portentous Arachnid seizing upon the shaggy ear of an unhappy animal, and turning it inside out in the struggle to grasp it, till a pair of horns with which the Arachnid seemed furnished could be plunged into the ear, in order to hold it fast. It is most like *C. saccatum,* and, we presume, is what has been called *C. incurvum* by Dr. Klotzsch. Whether it is a monster, as it well may be, or merely a gigantic form of *C. saccatum* itself, we are unable to say. No one, indeed, in the present state of knowledge can pretend to form a positive opinion as to what are

natural, what monstrous, what permanent, what accidental states of the genus Catasetum. The best service that can in the meanwhile be rendered to science is to publish figures of the flowers of as many forms, larvæ, species, or whatever else they may prove to be as appear to be different from each other. Eventually we shall no doubt learn how to interpret them. As regards the name of *C. secundum,* the drawing and dried specimens to which that name was provisionally given, although similar in form, were so very different in many respects, especially in size, that we can scarcely believe this plant to be what was intended. In fact, the name was suggested by the numerous flowers growing in a long secund or one-sided raceme.

VEGETABLE PATHOLOGY.—No. LIII.

236. Classification of Disease.—*a,* Internal or Constitutional.—*Functional.* It is probable that no constitutional disorder of the system can exist without concurrent organic change. This change may be only temporary. New circumstances or proper remedial measures may correct the existent evil, and the affected organism may return to its normal state of health and perfection. It is, therefore, strictly speaking, improper to distinguish functional from organic disease. Our powers of investigation may not be sufficient to detect the organic change in what is called functional disease, which may notwithstanding be more or less serious. It is to be understood, then, that in speaking of functional disease, it is not asserted that no organic change has taken place, but only such a degree of disarrangement as is not perceptible to ordinary powers of observation.

237. Functional disease is seldom so formidable as organic. From the very nature of the case, if death takes place, there must be some organic lesion, and the disease then ceases to be functional. Functional disease may, however, so depress the vital powers as to render the organism which is subject to it more exposed to the baneful influence of any accident, or as to induce serious organic disease, in consequence of defective elaboration of the sap, inactive generation of cells, insufficient deposit of nutriment, premature thickening of the cell walls, or by exposing the various matters which enter into their composition, or into that of the solid and fluid substances which they inclose, to the ordinary rules of chemical decomposition, and consequently to ultimate deorganisation of the constituent parts of the plant. The functional malady has in fact induced organic change.

238. However true it may be that vital force is only a name for a certain set of phenomena, so long as the cause of those phenomena is unknown, there is no serious objection to the term, provided we retain a proper consciousness of our ignorance. In functional disease this vital force may either be excited to such an extent as to produce unnatural development of different parts, to exhaust the powers by over excitement, or by the production of insubstantial cellular tissue which is not at all adapted for the maintenance of its proper functions, or to resist external influences which under other conditions might be harmless; it may, on the contrary, be depressed so as to prevent the completion of certain processes, as the formation of the floral envelopes or the proper impregnation of the ovules when formed; or, again, it may be so deranged as to induce abnormal conditions of the contained fluids, or the walls by which they are inclosed. These various conditions again may be so combined or modified as to afford the cultivator many useful objects of cultivation, often in consequence of their inducing organic change, insomuch that the promotion or sustenance of the peculiar functional derangement is the point to which his skill is principally directed. While on the one hand, for instance, sterility is the most injurious functional derangement which can occur, as in those trees which are cultivated simply on account of their fruit, there are others where the grand object is to encourage it as much as possible, or to defer the formation of fruit to the most remote period. A variety of Turnip or Cabbage, for instance, which has a tendency to run to seed, is perfectly useless for the objects of the cultivator, as fertility can only take place at the expense of the unnatural development of the cellular tissue of the root. The functional peculiarity, whatever it may be, which in the particular variety induces an organic hypertrophy, may at the same time induce a second functional derangement by which the formation of the organs of reproduction is retarded; and other cases might be induced where it is either altogether prevented or where the formation of perfect seed is a comparatively rare occurrence.

239. The true bearing of the terms functional and organic being thus explained, and their intimate connection with each other, I shall proceed to the consideration of specific diseases, keeping the distinctions above stated as strictly in view as it is possible, where they are so apt to elude the nicest appreciation. *M. J. B.*

PEAR GROWING.

The observations of "H. S. H." in the *Chronicle,* pp. 806, 807, 1854, prove that their author is an attentive cultivator. He has the rare good fortune to possess Pear trees which have attained the age of three-quarters of a century. He wishes to leave his trees as they are, and he is perfectly right. I would never induce any one to fell, or to mutilate large fruit trees, even if they only yielded fruits fit for kitchen use. It requires too much time and trouble to rear them. Pear trees of that advanced age must have retained all the vigour of youth, and by proper treatment may be preserved a long time in this state, and yield every year full crops. The care which this description of tree requires is not expensive, and in an ordinary year will not exceed the one-fifteenth or one-twentieth of the produce.

It is only necessary to bring the trees under a good system of pruning, to remove carefully all insects, to supply manure every year in order to repair the exhaustion resulting from very heavy crops. Let us suppose that the trees have been grown from their youth without pruning, that the main stem divides at a certain height above the ground, and that the upper branches have taken the directions natural to the varieties cultivated by "H. S. H." It is even possible that among them there may be some which have preserved an up-

right stem. The pruning applicable to these consists in removing, every year, the over-luxuriant shoots which spring up in the interior of the tree, and also the branches which cross and make confusion. The secondary and lateral branches should be kept in a horizontal direction, or made to form a wide angle with the vertical stem, or with the larger branches.

If the pruner observe branches that are too near each other he must thin them out, in order that the air may circulate freely, and that the solar rays may have access to produce their beneficial influence on the organs of fructification. If he see that these organs are too numerous, he must cut off part, especially spurs that are clustered, weak, and exhausted from long and abundant bearing. Judicious pruning will invigorate these large trees, and retard the period of their decrepitude. It ought to be borne in mind that the finest and best flavoured fruits are borne on young spurs from vigorous branches, or on the upper part of the vertical stem. In cutting off weak and bad placed branches, the cut is not made level with the bark of the stem or branch left, but only to the basement of the branch cut off [to those projecting rings which may be observed at the bases of lateral branches]. These wounds heal much better if they are immediately covered over with a mixture of clay and cow-dung. Bruised and cankered portions and excrescences should be cut to the quick, and then covered with the above composition. These operations should be performed according to the nature of the soil and the vigour of the tree—before the winter solstice in a dry soil; and, after the severe frosts are over, in February, where the soil is strong and rather moist.

Immediately after the trees are pruned they should be cleaned from those insects with which they are usually infested, and more especially old trees. Indeed, the older the tree the greater is the number of insects by which it is attacked. The withered leaves, rolled or stuck on the branches, twigs, or spurs, harbour myriads of insects. The wrinkles between the fruit-buds or in the axils of the ramifications, the small grey rings which surround the fruit-buds, and the larger ones of a bright brown colour which surround the last year's shoots, the nests of every kind which may be observed in the crevices of the old bark of aged trees, contain legions of insects known to the entomologist. All these receptacles ought to be carefully removed. The old bark should be scraped off smooth from the trunk, and the latter done over, from top to bottom, with a composition of clay, cow-dung, and about one-third of wood ashes. A first cleaning, carefully performed, will preserve the tree, and the labour in following years will be of less importance.

If, on the contrary, the cleaning is omitted, all sorts of insects will be hatched at the first flow of sap: some perforate the corolla and devour the ovary of the young fruit; others attack the fruit already set, and destroy it; others cut the shoots, and devour the leaves, destroying the verdure of the tree, the vegetation of which thus receives a mortal stroke in the midst of its spring or early summer development. When we see the fruit drop successively in May, though scarcely set, we must not attribute it solely to the severity of the climate. There are other causes. Has the tree sufficient nourishment in the situation in which it is placed? Have there not been left upon it too many fruit spurs, producing a superabundance of flowers, tending to weaken the productive powers? In this weak state, is it not possible that insects, if not previously removed, will complete their work of destruction? Induce good vigour in the tree by pruning and thinning the branches; keep it clear from insects, and give it as sufficient nourishment as we would to other productions of the soil: in these things consists the great secret of the culture of full-grown Pear trees.

What is the kind of manure that a full-grown Pear tree requires as nourishment and as a stimulant?

I shall confine myself to the practical consideration of this question. The Pear tree, when planted in a kitchen garden, finds, by means of its fibrils, the nutritive substances which it requires. For strong soils, the preference is given to horse-dung mixed with rotten straw. For light soils, on the contrary, cow-dung is given. By the use of horse-dung in strong moist soils the ground is rendered warmer and more porous. On the other hand, the excessive heat of light soils is moderated by cow-dung. It is in these decomposed manures that the spongioles of the roots find the nourishment indispensable for the production of fruit. Nightsoil, cow-dung, or other manures in a liquid state likewise produce stimulating effects upon the vegetation of the tree and its products. It is also to be remarked that the Pear tree planted in a kitchen garden always yields fruit, and continues to be tolerably vigorous, provided that the spade in the hands of an ignorant workman does not destroy the upper roots of the trees, and thus neutralise the benefits that otherwise would result from the manure. If the trees are in an orchard where domestic animals are allowed to graze, the same nourishment as in the case of the kitchen garden must be given, otherwise the trees will become barren; or if they, by chance, bear some fruit, it will be small and without flavour. The turf should be removed round the tree to the distance of 2 feet, in order that the air and the sun's rays may produce their beneficial effects upon the roots near the surface. Throughout the winter these should be covered with leaf-mould and various manures suitable to the nature of the soil. At the end of autumn the turf of an orchard should have a top dressing of ashes, lime, rotten horse dung, cow dung, or sheep's dung, according to the nature of the soil. This general manuring should be repeated every two years, and in such quantity as the soil may require. An orchard kept for fruit trees only requires stimulating manure every year, to the amount of 2½ to 3 bushels for every 50 square feet. Stimulating manure in a liquid state, given in the first fortnight in March, will contribute greatly towards starting the trees into a good state of vegetation, and will promote the setting of the fruit, especially if the trees have been well thinned and cleaned from insects.

It is needless to add that the varieties of Pears planted in an orchard ought to be of a hardy vigorous nature, if we wish to obtain satisfactory results. They ought to be selected from amongst those varieties that are adapted for orchard culture. This important point deserves to be treated of in a special article. *J. de Jonghe, Brussels, Dec.* 20, 1854.

PODOLOBIUMS.

These, when well-managed, are very handsome plants, and well worth a place in even select collections. In procuring young plants of any of them from the nursery beginners should be very careful to obtain such as are stocky, healthy, and not under or over-potted; for any of the Podolobiums will be found to be somewhat difficult subjects if they are ever allowed to get into a bad state of health, and of course they should not be purchased in that state. If they are obtained at the present season they will merely require a careful supply of water and a rather airy situation in the greenhouse during winter. Early in March place the young plants in the closest part of the house near the glass, and have soil &c. in readiness to give a shift as soon as it may be necessary; but defer this until the pots are moderately filled with healthy active roots. After potting water cautiously, keeping the atmosphere rather close and moist, and sprinkling the plants lightly over-head on the afternoons of fine days, in order to encourage the roots to strike into the fresh soil. When fairly established after shifting, a more liberal supply of water will be necessary, but this must still be administered with care, and air should be freely admitted on fine days, but avoid cold drying currents. Plants that have several shoots should have these tied out directly after potting, keeping them thin and the points rather low, in order to induce the back buds to push forward, and those that are at all inclined to be straggling should be stopped as soon as the roots are supposed to have got hold of the fresh soil.

As the weather becomes warmer in spring give air more freely, and do not through impatience subject the plants to an artificially warm temperature; for few of our greenhouse hard-wooded plants bear anything like forcing, and the Podolobiums are perhaps more impatient of such treatment than most others. About the beginning of May the young plants may be removed to a cold frame, which will be the best possible situation for them during summer. If cold stormy weather occurs after the plants are removed hither, cover the glass at night, and regulate the admission of air during the day so as to prevent their sustaining any check. In fine weather too much air can hardly be given, and a thin shade should be thrown over the glass on the forenoons of bright days; also keep the atmosphere moist by frequently sprinkling the floor of the pit, and the plants should be lightly syringed every fine afternoon, shutting them up before the sun is quite off the glass, so as to give them a good steaming for the evening, but air should be given before night. Healthy vigorous plants will probably want a second shift by Midsummer, and it will be safer for beginners to give two small shifts in the course of the season than to give a large shift in spring; the second shift should be given as soon as it may be wanted, in order that the plants may get moderately well rooted into it before winter. Attend to the stopping of any over-luxuriant shoot and to keeping the shoots nicely tied out, and aim at securing well-placed, useful growth, and not such as will require to be largely cut away next spring. Discontinue shading and sprinkling over head as soon as the weather becomes cool in autumn, and give the plants the benefit of the night dews, placing the lights when the weather is at all doubtful so that they will throw off heavy rains. Remove the plants to a light airy situation in the greenhouse before there is any danger of their suffering from damp or cold; and during winter give them a careful supply of water at the root, and turn them partly round at least every fortnight. Also examine the under side of the foliage occasionally for red spider; and if there are any indications of the presence of this enemy, lay the affected plant on its side on a clean mat, giving the foliage a good washing with the syringe, and let this be repeated as often as may be necessary to thoroughly eradicate this pest. In spring the plants should be removed to the warmest part of the house, and moistened with the syringe on fine afternoons, to encourage them to start into growth. See to stopping or cutting back the shoots as may be wanted, removing the flowers as they make their appearance, and treat them during the summer as recommended for last season. After a second season's growth, if all goes on well, they should be nice-sized little specimens; and if they are considered large enough to be worth attention for flowering, let them occupy a cool part of the greenhouse until after flowering, when the shoots should receive whatever pruning or training may be necessary, keeping the plants rather moist until they start into growth, when they should be repotted, treating them during the remainder of the growing season as nearly as on former years as circumstances will admit, placing them in a cool moist part of the greenhouse when they become too large for a cold frame. If well managed good large specimens will soon be obtained, which, with careful treatment, will last for several seasons; but be prepared for the occasional loss of a specimen by having young plants to succeed it. Be careful to keep them perfectly free from red spider, and to keep the soil in proper state as to moisture, giving water only when it is absolutely necessary, and then giving a good soaking.

The best soil for Podolobiums is rich turfy peat broken small and liberally mixed with clean sharp silver sand, some small clean potsherds or lumpy bits of charcoal. In potting use plenty of draining materials, and be careful to have the soil in a nice healthy state as to moisture, making it rather firm about the old ball, to prevent the water passing off through it, and never shift a plant until it actually requires more pot room, nor when the roots are not in a healthy active state. *Alpha.*

LIST OF ANNUALS.

Of different kinds of Annuals we have now a great many in cultivation, and yet their number is yearly augmented, many of them ranking amongst the most showy plants which adorn our flower gardens, whilst others are invaluable for the decoration of our greenhouses, &c. My object in furnishing the following selection is not merely to give a list of those which are so well known, such as Nemophila insignis. Clarkia pulchella, and the common Candy-tuft, but to make a few common-place remarks on some of the more rare kinds, or, if not rare, such as are seldom seen in cultivation so much as they deserve to be; while at the same time any seedsman may supply nearly the whole of them for a very trifling sum.

Bartonia aurea.—A showy Californian plant, with rather a straggling habit, and remarkable for its large bright yellow flowers, and numerous long stamens; it grows from 18 inches to 2 feet in height, and is well adapted for patches on borders.

Bahia latifolia.—This is a strong-growing Californian plant, which branches very much, and rises about 2 ft. in height. Its flowers are star-shaped, of a pale yellow, and are produced in abundance. It is well adapted for patches.

Cacalia sonchifolia.—This is a very beautiful East Indian plant, of erect habit; it grows about a foot in height, and bears flowers of a golden yellow colour. It is a most desirable plant for patches or beds, and requires to be sown thickly.

Calandrinia umbellata is a very dwarf plant, which throws up numerous scapes of blossoms, about 6 inches in height. Its flowers are of a rich glossy red colour. It is a charming little plant, either for rockwork, patches, small beds, or pots; it requires to be sown in pots early in spring, as it does not bear transplanting well. It is a native of Chili.

Calandrinia discolor.—This is also a dwarf Chilian plant, with thick fleshy leaves. It throws up its racemes of flowers about 12 inches in height, the flowers being of a rich rose colour. It is well adapted either for patches or beds, and requires the same treatment as C. umbellata.

Calceolaria chelidonioides.—This can be had in flower in any season of the year; it grows about 18 inches in height, and produces abundance of pale yellow blossoms, which are, however, of short duration. It is a desirable plant for filling up vacant spaces, as it comes into flower so soon. It was introduced through I. Anderson, Esq., of Edinburgh.

Campanula (Specularia) vincæflora is a pretty plant when grown in masses; it rises about 12 inches in height. The flowers, though rather small, are of a deep blue colour, with a white throat, and are produced abundantly. It is a native of New Holland, and is altogether a good thing.

Campanula (Specularia) pentagonia.—This much resembles the former in habit, but has larger flowers, of rather a paler colour. It is a native of the Levant. There is a variety with white flowers called C. pentagona alba.

Cenia turbinata.—This is a Camomile-like Cape plant, which flowers most profusely. The flowers are of a white colour, and rise about 6 or 8 inches in height. It is well adapted for borders or beds, or it would even make nice edgings. C. turbinata formosa is a variety with yellow flowers.

Clintonia pulchella is a delightful little annual, which is not so much cultivated as it should be. It is well adapted for pots, patches, or beds, and is best sown where a gentle heat can be afforded it. It is a native of N. W. America.

Coreopsis coronata.—This is a showy plant, with large star-shaped pale yellow flowers, with a purple centre. It grows from 18 inches to 2 feet high, with thin wiry stems, and is of a straggling habit, but makes a most beautiful bed, or it may be sown in patches. It is a native of Mexico.

Dianthus Gardneri is a neat Pink, which throws up its flowers about a foot high. The latter are of a deep red colour, with a fringed edge. It is well worth growing in pots, and forms a beautiful bed through the summer. It comes from the south of Europe.

Eucharidium grandiflorum.—This is a pretty plant, which grows about a foot in height, and has flowers much resembling those of Clarkia pulchella, though darker; it is a most profuse bloomer, and is well adapted for beds, patches, or long lines on borders. It is a native of North America.

Eucnide Bartonioides is a very showy South American plant, with large flowers of a bright yellow colour. It grows about a foot high, and is of rather a straggling habit. It is a tender plant, and only suitable for pots.

Eutoca viscida.—This is one of the best of annuals. Its flowers are of a deep blue, and are produced in great abundance; it grows about a foot high. It makes a pretty bed, or good specimens of it may be grown in pots. It is a native of California.

Gaillardia picta.—This is a splendid thing, with star-shaped flowers of a purple colour, with a yellow edge; it grows about a foot in height, with slender stems. A good plant either for beds or patches. It is a native of Louisiana.

Gilia achilleæfolia is a neat Californian plant, of erect habit, and when sown thickly makes a most beautiful bed. Its foliage is of a dark grass-green, and its flowers of a dark purple and blue colour; it grows about 15 inches high. It is a stronger growing plant than G. tricolor.

Gnaphalium (*Helichrysum*) *bracteatum.*—The old Everlasting. This, although a very old New Holland plant, is not seen in cultivation so much as it deserves to be. Its large yellow flowers render it a very conspicuous object. It grows about 3 ft. hign. There are also white varieties of it. It is best grown in patches on borders.

Godetia Schami.—Of all the Godetias this one is the best. It grows about 15 inches in height, and produces an abundance of large pale rose-coloured flowers, stained with a bright red blotch in the centre of each petal. It is altogether a very desirable plant, well adapted for beds. It is a native of California.

Heliophila trifida is an interesting little plant, either for green-house decoration in spring, or open borders in summer. It grows about 9 inches high, and produces abundance of small blue and white flowers. It is a native of the Cape of Good Hope.

Hibiscus africanus.—This is a profuse blooming plant, which well deserves cultivation. Its flowers are dull white, stained with purple; it grows about 18 inches high. It makes a pretty bed, and is also a good thing for borders, keeping in bloom throughout the summer. It is a native of Africa.

Ipomœa Burridgi.—This plant resembles the common Convolvulus major, of which it is a variety. It is a profuse blomer, with rosy-pink flowers, melting into white in the centre. It is well adapted for covering trellis-work. *J. H. Beckman.*

(*To be concluded next week.*)

Home Correspondence.

The Lois-Weedon Cultivation.—I have always been interested in the perusal of Mr. Smith's pamphlet, but one stubborn fact has invariably met me, viz., the cost of the double digging, and I may also add that of the single or common digging or forking. I am a nurseryman, and have many acres of land with a stiff clay as subsoil under cultivation with the spade; this is a fine Wheat soil, and has often given from 5 to 7 quarters per acre of Wheat when under the plough. Now this land when first broken up, and indeed, always, costs 1*s.* per rod to double dig, *i.e.*, to dig two spits deep, and bring the bottom spit to the top; this of course is 8*l.* per acre. Now if I understand it correctly, I read in your columns last week that the double digging of the spaces between the crop on an acre amounting to half an acre of land, costs only 1*l.* 10*s.*, or 4½*d.* per rod. Again, the single digging of the same quantity of land, costs 10*s.*, or 1½*d.* per rod. Every year I have many acres of land double dug; the stiff clayey land costs invariably 1*s.* per rod, or 4*l.* the half acre, and when the subsoil is broken up for the first time, often 1*s.* 2*d.* or 1*s.* 3*d.* per rod, and a tender loamy clay without stones that has been nearly a century under spade cultivation costs 10*d.* per rod; this is the lowest price I have ever given, and the labourers require being looked after very sharply to make them do it thoroughly and well. I have lately employed Parkes's forks, which have made the work less laborious, but have not decreased the expense, as their wear and tear is most rapid when employed for double digging. For single digging or forking my price is, for stiff badly working soils 3*d.* per rod, or 1*l.* the half acre; for friable free-working soils, 2½*d.* per rod. Now this great difference in the cost of labour in counties so near to each other as Hertfordshire and Northamptonshire is of vast importance to the carrying out the Lois-Weedon system. I am inclined to think that there must be some error in the Lois-Weedon prices. Perhaps some Northamptonshire friend can throw a little light on the subject. *T. R., Herts.*

Pears on Quince Stocks in Mississippi.—The following extracts from the proceedings of the American Pomological Society just published, are of interest as showing the effects of a warm climate and rich soil on Pears. The soil near Natchez, in which the trees alluded to below grow, is a rich black vegetable mould 18 inches in depth, resting upon a stratum of hard clay, underlaying which is a yellow loam filled with fresh-water shells. Climate: winters generally mild and open; snow seldom falls; the thermometer has been known to fall to 14°, but this is very unusual; the temperature during the months of May, June, July, August, and September is almost torrid, the thermometer rarely falling under 80°, and often rising to 90° and 95°. The latest kinds of Pears ripen early in the autumn. Williams' Bon Chretien, on the Quince, fruit large, many weighing fully 1 lb.; in eating during all July and August; requires gathering before ripe and ripened in fruit cellar. Duchesse d'Angoulême: trees on Quince stocks, six years old from the bud; 20 feet and more in height; stems 6 to 8 inches in diameter; fruit large, many 1½ lb.; flesh buttery, and very juicy; in eating all July and August. Beurré Diel: on Quince stocks; trees seven years old, large and vigorous, bearing heavy crops; after thinning this season, 150 specimens were left on each tree, weighing from 1 to 1½ lb. each; they ripened finely in the cellar; in eating all July and August; quality first-rate. Winter Nelis: on Quince; fruit large; flesh buttery and very melting, abounding in rich aromatic juice; in eating October and November; quality quite first-rate. Chaumontel: fruit very large, weighing 1 lb., ripe in October and November; flesh buttery, sugary, and melting, with a slight perfume. Glou Morceau: on Quince; trees ten years old, large, and growing very vigorously; fruit large; flesh buttery and exceedingly sugary; ripe in October. Marie Louise: fruit large; flesh very sugary, having also a high vinous flavour; ripe in August. *T. R.*

Zephyranthes.—Am I correct in supposing that what they now call Z. candida is that which we used to call Tubispatha? I should also be glad to know whether the other species (such as Rosea, Atamasco, Carinata, and Grandiflora,) are as hardy as that one which flowers in my border without being near any flue. *A. H.*—[The learned author of Amaryllidaceæ considered Z. candida to be separable from tubispatha, almost as a genus, which he called Argyropsis. The other species are always regarded as greenhouse plants, unless in very mild climates.]

The Golden Gourd in its present coat of rich green and gold makes a pretty substitute for flowers in hanging pots in verandahs and other dry places, where they last a long time, and become a rich orange colour. *Somerset.*

Gynerium argenteum.—I have been rather appealed to in reference to this plant; but I can add little to what has been already said about it. Its head-quarters are undoubtedly in La Plata; it is found abundant near Corrientes, on the Parana, as stated by "A. W.," of Liverpool; it is also abundant at Conception, and on the river Salado, and may extend to Buenos Ayres, but I did not see it at the latter place. "A. W." has confounded G. argenteum with G. saccharoides when he states that it is found at Sanguexuga and San Paulo, in Brazil; the latter is found there very abundantly, and I think is far the more ornamental of the two—the panicles being longer and thicker, the stems stronger, and the leaves nearly twice the width. My friend D. Moore, Esq., of Glasnevin, states that the two plants which he raised were both females, and that there cannot be any male plants in the country. I have enclosed you a spikelet from the St. Vulcen's plant, and one which I received yesterday from Kew; the latter is evidently a male, the anthers being very distinct; I am not aware where the Kew plant came from. You will perceive a great difference in the colours of the spikelets, but this may be owing to the weather. *K. S., Woodlands, near Dublin.* [The plant from Kew is no doubt a male, that from St. Vulcen's is a female, as is the plant in the garden of the Horticultural Society. The differences you remark are sexual. It was too late to use the male Kew plant when it was ascertained that it was a male.]

A. Saul.

Grafted Rhododendrons.—My remarks on grafted Rhododendrons (see p. 821, 1854) assumed considerable length, because I was called upon to explain the principles on which my objection to them was founded; and this led me away from the practical part of the subject. I would now offer a few further remarks on the practical objection to such plants, which holds good alike in small and in large gardens, and is altogether independent of the question whether the finer varieties are dwarfed by grafting or not. These remarks apply equally, if not with greater force, to Azaleas, which it is now also the fashion to graft, as to Rhododendrons proper. I do not of course speak of greenhouse Azaleas, to which grafting is in many cases specially applicable, but of the common shrubby species. All these plants, both Rhododendrons and Azaleas, are thorough shrubs, continually throwing up sucker-like shoots from the root stock wherever light has access to it; and the character and beauty of the plant consists in this its natural growth. Now a grafted plant is precluded from exhibiting this habit; nor is this all, the stock possesses and retains it, and the utmost vigilance will scarcely prevent such shoots pushing up from the stock and starving the graft. Their shoots may be destroyed in the nurseries, where the plants are constantly looked over, but when once the plants are transferred to beds and masses in private gardens, these shoots are sure to be overlooked. I have never yet looked through a collection of grafted Rhododendrons without detecting such shoots which had escaped the gardener's eye, and often formed nearly half the apparent plant. In the case of Azaleas, the evil is still greater. Azalea pontica, which is employed as the stock, is a very strong growing kind, with a peculiar tendency to throw up sucker-like shoots; and these will in a single season out-top the rarer variety grafted upon it. The Azalea has in fact a very great tendency to renew even its natural growth in this manner—the older branches growing feeble, and the plant being renewed by strong shoots from below; and this is especially the case if its growth be checked by removal. As far as my experience goes something of the same kind takes place with all grafted Azaleas. They look more like branches broken off and stuck in than real thriving shrubs, and they are surrounded with a forest of suckers. I consider that a grafted Rhododendron is quite as objectionable as a grafted Fir tree, though from a different cause, and much more inexcusable. It is difficult, or at least tedious and troublesome, to strike the genus Pinus from cuttings, and they do not make good plants; so that, if you wish to propagate a rare species, of which no seed has yet ripened in England or can now be procured from abroad, you are almost reduced to the expedient of grafting. In the case of Rhododendrons there is no such excuse. They strike from cuttings with little difficulty, and are propagated so easily by layers that natural layers may be found around most old plants; they are, moreover, raised with the greatest ease from seed, and the individuals of a batch of seedlings differ so little from one another, that out of the many hundreds of alta-clerense which were raised from the same batch of seed, and dispersed throughout the country, every individual may be recognised at once as belonging to the same species, though some slight individual differences may be detected between them if compared. In conclusion, I believe that whenever a collection is formed of grafted Rhododendrons, before many years have elapsed the bed will be found to consist principally of Rhododendron ponticum, the grafts having perished and the stocks assumed their place. *J. R.*

Cuthill's Black Prince Strawberry.—I potted a quantity of this variety in the latter end of July last, and by the end of October I found that they were throwing up blooms; I therefore placed them in a Vinery whose temperature ranged from 50° to 55°, where they still continue to bloom and set fruit. I gathered a few ripe berries on the 18th of December, and on Christmas Day I had a beautiful dish of ripe fruit. To-day, again (1st of January, 1855), I have gathered another dish equally good, and I have still a quantity of fruit set and blooms appearing in succession so as to promise a supply for the next two months. I think that by bringing back the early forced plants of other varieties into the houses and introducing this variety early in autumn, Strawberries may be gathered every month in the year, as I have only been out of them 6 weeks since February last. *George James, Pontypool Park.*

Societies.

POMOLOGICAL, *Jan.* 1*st.*—Mr. John Lee in the chair. Specimens of a Seedling Apple, exhibited by W. Marshall, Esq, of Ely, were found to possess a brisk flavour and considerable juiciness, with the aroma of the Oslin. A collection of 8 varieties of apples, from orchards in Gloucestershire, were sent by G. S. Wintle, Esq., of Gloucester; among them were fine examples of Golden Harvey, grown on a clay soil; also of Ashmead's Kernel, from a light loam on a sandy subsoil. The others were chiefly Cider Apples of the neighbourhood. Mr. Cranston, of Hereford, exhibited specimens of 10 varieties of Pears and 11 of Apples: the former embracing many of the seedling varieties raised by the late Mr. Knight. Four new members were elected.

Notices of Books.

The Flora of Yorkshire; with a Supplement. By H. Baines. 8vo. Longmans.

THIS is a reissue of the author's original work combined with a new supplement of about equal dimensions. The latter has been prepared by Mr. J. G. Baker and Mr. John Nowell, and when we say that it forms a worthy companion to Mr. Baines' very useful work, we place it where it should be, alongside the best of our local Floras. The Supplement may be described as a critical inquiry into the districts really occupied by undoubted Yorkshire plants, and the claims which the doubtful inhabitants have upon the Flora, together with the relation that exists between the distribution of the vegetation and the geological formations of the county. In these considerations the new editors are evidently at home; they are well acquainted personally with the greater part of the facts on which they rely. they have had excellent assistance from judicious and

experienced correspondents, and they have evinced great good sense in separating the alien species now overrunning the country from the true original denizens of the land. The book will be read with interest, not only by the inhabitants of Yorkshire and the neighbouring counties, but by all who take an interest in the distribution of plants.

Garden Memoranda.

The Crystal Palace, Sydenham.—Many have been of opinion that plants would not succeed inside the palace, and some have even gone so far as to say that the difficulties which beset the attempt would be found to be altogether insurmountable. Such, however, we are happy to report, has not proved to be the fact; indeed, experience as yet is wholly in favour of the project; for the plants of all kinds with which the building has been furnished could not, we think, all things considered, possibly be in better condition than they are at the present time. It is true that some of the Palms and very tender stove plants have suffered a little for want of warmth; but this has been remedied by partitioning off the part appropriated to their growth by a canvas screen, and now all is going on satisfactorily.

As regards Conifers, the building may be said to be rich in Norfolk Island Pines (Araucaria excelsa), two magnificent specimens of which, presented by his Grace the Duke of Devonshire, are planted in the centre transept. These are even now too large for any ordinary conservatory; but here, we need scarcely say, they have room enough for ample development. In the south transept on the west side are two other specimens of this Pine, one presented by the Messrs. Veitch, from their nursery at Exeter, and the other by the Horticultural Society, from its large conservatory at Chiswick. The latter has been but recently planted, and has its trunk and branches covered with damp moss, in order in some measure to prevent exhaustion till the roots have taken hold of the soil. Two more examples of this noble tree from Windsor, presented by her Majesty, deserve remark: they stand near the north-west end of the building, and look as if they had already "taken" to their new situation. In front of the tombs have been very appropriately placed a few plants of the funereal Cypress.

The noble Orange trees from the Chateau de Neuilly, which line the sides of the transept, appear to be in perfect health, with the exception, perhaps, of a few specimens which have been lately imported, and which suffered from salt-water and other accidents consequent on removal. Most of these trees are of immense size, with broad heads and clean stems, and serve in no ordinary degree to embellish the noble edifice. They are associated in places with standard Bays, and huge specimens of variegated and common American Aloes. A fine plant of the latter, in the "Geographical distribution of plants," is stated to have borne without the least injury 14° of frost, showing that these plants are rather more hardy than many have supposed them to be, and that they might possibly be even employed, if protected a little in winter, for out-door decoration.

The rocks in the European and Chinese departments are becoming tolerably well covered with plants, and the Hypnum-like Saxifrage, which has been introduced pretty plentifully here, appears to be a good plant for clothing the soil about them with verdure. In the north African and Australian departments a few Ferns are growing in great luxuriance, and in the last-named division we noticed a good plant of the Casuarina torulosa or Australian Beef Tree.

The plants in beds have been mostly re-arranged, and apparently replanted as skilfully as it is possible with regard to effect. The Camellias, which at present form the bulk of flowering shrubs of any size in the building, are well set with buds, and therefore a grand display of this glorious flower may soon be expected. White Chinese Azaleas, too, of which there are some huge specimens, promise to blossom well; these are planted in peat, among masses of roots, which form as it were a sort of pot for them. Scattered throughout the beds are such plants as Dracæna indivisa, Yuccas, New Zealand Flax, Hedychiums, and even Palms, all of which serve to give an exotic appearance to this the cool part of the house. Of Hakea Victoriæ there is a fine plant, as well as of Acacia grandis and decurrens; indeed the latter are, perhaps, the largest specimens of the kind in the country. Aralia crassifolia stood 14° of frost here, as did also Stadmannia australis. Berberis nepalensis grows uncommonly well here, as do also Ficuses of all kinds, whose ample foliage is very ornamental. The two great Epacrises, bought at Mrs. Lawrence's sale, have been planted out and promise to do well. Intermixed with the above are smaller specimens of many interesting plants, among which we remarked the Camphor tree, Olives, various Eucalypti, Gardenia Rothmanni, Franciscea confertiflora, and other plants which are usually kept in stoves, all apparently in a healthy condition.

Among the Palms which bid fair to succeed in the temperate part of the building, where the thermometer has been down as low as 36°, are Areca sapida, Corypha australis, Latania borbonica, the Wax Palm, Chamædorea elegans, Cocos plumosa, Chamærops Martiana, Sabal Blackburniana, Seaforthia elegans, and one or two others. Caryota urens has been tried, but it is evidently suffering from cold. Near the above are some immense specimens of Elephant's Foot, imported from South Africa, and associated with them is Rhipidodendron plicatile, an Aloe-like plant, also of great size. Such specimens as these, and especially the Palms, we need not say, serve in an eminent degree to vary the appearance of the place, and increase its interest. In the borders in front of the shrubs Hyacinths and other spring bulbs have been planted, with a view to keep up a little gaiety in the early part of the year.

The baskets of plants suspended from the roof still look green, and some of the climbers trained up the supports are growing freely. A Wistaria brought from Messrs. Loddiges has been replanted with safety, and has now nearly reached the top of the transept roof.

Preparations are being made for planting the Victoria Regia and other choice aquatics in the water in the west end of the house. The soil is put in, the hot-water pipes are laid, and in due time the basin will be filled with water. At the other end of the house the water is already stocked with Water Lilies, among which the blue one is still in flower.

In the tropical end of the building, some few of the tender Palms and very tender stove plants have, as we have stated, been injured a little for want of warmth. This has, however, been remedied, as we have already stated, by enclosing this part with a canvas screen, which completely cuts it off from the rest of the house. Since this has been done, any amount of heat can be maintained which is necessary. As regards the condition of the Palms here little can be said at present; they appear to have got well over the effects of removal, and to be in good condition to commence growth as soon as spring shall have set in. Among them are some noble specimens which, however, look small in this great glass-house, compared with what they did in the Palm-house at Mr. Loddiges'. The Palmetto, especially, is a very fine example of this fine Palm. It stands conspicuously at the end of the transept, and is planted in a cement-covered brick basin, 16 feet in diameter. The Musas, with their broad leaves, are very effective; but at present this part of the house is rather bare of foliage.

Out of doors the grounds are fast approaching completion. All may be said to be finished down to the water temples, which are nearly up; the cascades below them have been formed, and the ground about them put into shape. What still remains to be executed, is the part about the islands where the extinct animals are placed. Water has now been let into all the lakes except the large ones below the cascades.

FLORICULTURE.

Carnations.—Your correspondent's remarks (see p. 839, 1854) respecting the colours running or sporting of his Carnations, will doubtless be read with interest. I for one am sorry to say that I have had half a dozen of my best flowers sport this season, and I am at a loss to what to attribute it. I certainly cannot say that high manuring is the cause of the evil, for in my case, having nothing but green manure by me, I had them potted without any manure at all; high manuring cannot, therefore, be the sole cause of flowers sporting, although no doubt more flowers run from that cause than any other, for they are not so liable to sport in the open borders in common mould as in rich soil. I have generally noticed that in hot dry summers the flowers are very apt to sport; and I have no doubt that the season, as well as the soil, has a great deal to do with the evil: we generally find that Scarlet Bizarres, Purple Bizarres, and Scarlet Flakes are the classes that are most liable to run, being very rich and high in colour. I am of your correspondent's opinion that manure water should not be applied until the pods begin to burst; but it is a good plan to water them with a little clean soot water, in order to keep the foliage of a good dark colour. The following compost has been recommended by an eminent grower for flowers apt to sport, or we may say for the more delicate kinds, which are the most likely to sport:—3 barrows full of good loam; 1 ditto old rotten cow-dung; 2 ditto ditto horse-dung; ½ ditto sand; ½ ditto lime rubbish, or old plaster, to be mixed well together 12 months previous to its being used. *E. B.*

The Chinese Primrose.—What more useful flower have we than this? My greenhouse at the present time is as gay as it well can be with well-grown plants of all the best varieties of it. Some of my sorts, all of which I raise from seeds every year, have flowers which measure upwards of an inch and a half across, and in colour are of a deep glowing crimson. The beauty of a fine head of such blossoms may therefore be better imagined than described. Fine blooming plants of the Chinese Primrose, that will continue in flower through the whole of the winter months, may be produced as follows:—In order to obtain strong plants, the seed should be sown not later than the first of May in a well-drained store pan, in a light sandy soil, and put into a cool frame, as near the glass as possible. When large enough to be pricked off into store pans the young seedlings should be allowed a square inch between each plant; when that space has been filled, let them be potted singly into 3-inch pots, and as the pots become filled with roots, shift into a size larger pot, giving them their final shift into 6-inch pots in the early part of September. The compost in which I have found these plants to thrive best has been equal parts turfy loam and leaf-mould, and a little sharp sand. While growing, a cool pit or frame suits them best; give plenty of air, and be careful not to overwater them. Treated in this way the plants will be in flower by the middle of November, and will continue in blossom through the whole of winter, and to be seen to advantage they should be moved to a greenhouse or conservatory. *R. M.*

Fumigating Soft-wooded Plants.—It may be useful to know that soft-wooded florist flowers and other tender leaved plants of all kinds will withstand without injury as much tobacco smoke as any person can afford to give them, provided their leaves are perfectly dry. I have had Cinerarias, Calceolarias, Fuchsias, and the like, much injured after smoking through the leaves being damp. Let the plants be next to flagging before you smoke them; and to convince you of the truth of my assertion, let one plant be gently syringed before smoking, and it will soon be apparent what is the cause of plants suffering from fumigation. *C. C.*

Chinese Primula: *D W C.* Your variety with leaves slightly variegated is of no value. There are much prettier variegated kinds already in cultivation.—*W M.* All very handsome sorts, more especially No. 1, which measures 1½ inch across, and which is prettily fringed and of a brilliant crimson colour.

Miscellaneous.

The Big Tree (*Wellingtonia gigantea, Lindl.*).—Dr. C. F. Winslow, in the "California Farmer," a weekly journal published at San Francisco, has given an account of his excursion from "Murphy's Camp," (2400 feet elevation), to the site of the "Big Tree," on the very stump of which he writes his letter (Aug. 8, 1854), the spot itself being designated, at least by him, "Washington Mammoth Grove." If this account is to be depended upon (and it must be confessed the learned Doctor's style is both flowery and hyperbolical), we learn some new and interesting particulars respecting this gigantic tree:—1, That the accounts brought home by our sober English traveller, Mr. William Lobb, do not give us the full height to which this Pine attains, by one-fourth; 2, that the locality seems to be circumscribed to an area of a few acres; and 3, what concerns us more, now that Messrs. Veitch and Sons have enabled us to possess living plants, that the soil and atmosphere at the place of growth are singularly humid; and in this we think the Doctor is likely to be correct. Omitting then, the mention of "the sublime thoughts, such as have rarely before impressed his soul,"—"of such a nature that he often involuntarily surrendered himself to the idea that he was approaching the visible and actual presence of the Great One who revealed himself to Moses on the heights of Sinai," &c.—we shall confine ourselves to the following extracts:—"The road (from Murphy's Camp) gradually ascending for several miles over a varied landscape, becomes afterwards more level, or rather it undulates and winds for a long stretch among hills and valleys thickly wooded, and fit for farms and deer parks. During the last three miles the ascent is steady and through a virgin wilderness of Pines, Firs, Spruce, Arbor-Vitæ, and other cone-bearing trees, whose magnitude perceptibly increases with the altitude of the locality. The whole surface of the hill-sides is covered with herbage or plants, more or less verdant, and in spots there is a freshness to the verdure which reminds one of spring, and which contrasts strongly with the arid and dusty plains and hills of the lower sections of country. The wild Raspberry, Strawberry, Pea, and Hazelnut mingle their humble or more prominent foliage with the diversified undergrowths of the forests; and here and there new and attractive flowers struck my eye so pleasingly, that I was compelled at times to stop, gather, examine, and admire them. The charm of these regions to the botanist would be in the freshness and luxuriance with which Nature elaborates her vegetable forms. The vital principle, stimulated by the condensing vapours of the cool fresh air of night, and nourished by a suitable pabulum in the decomposing soil, acts with a steady energy, and thousands of stately trees stud the hills in all directions, so lofty as to amaze the observer, and to compel him when near them to strain his eyes to catch a view of their topmost off-shoots. But the most amazing of all these vegetable productions are here; and Nature, by peculiar geognostic arrangements, seems to have isolated them to startle and arrest the attention of mankind, and to strengthen scientific truth touching the special distribution of organic races. So far as known, the vegetable growth to which the name of 'Big Tree' has been attached, grows in no other region of the Sierra Nevada, nor on any other mountain-range of the earth. It exists here only, and all the individuals of its kind, so far as I can learn, are localised to this vicinity. They are embraced within a range of 200 acres, and are enclosed in a basin of coarse silicious material, surrounded by a sloping ridge of sienitic rock, which in some places projects above the soil. The basin is reeking with moisture, and in the lowest places the water is standing, and some of the largest trees dip their roots into the pools or water-runs. The trees of very large dimensions number considerably more than one hundred. Mr. Blake measured one 94 feet in circumference at the root; the side of which had been partly burnt by contact with another tree, the head of which had fallen against it. The latter can be measured 450 feet from its head to its root (!) A large portion of this fallen monster is still to be seen and examined; and by the measurement of Mr. Lapham, the proprietor of the place, it is said to be 10 feet in diameter at 350 feet from its uptorn root (!) In falling it had prostrated another large tree in its course, and pressed out the earth beneath itself so as to be imbedded a number of feet into the ground. Its diameter across its root is 40 feet. A man is nothing in comparison of dimensions, while walking on it or standing near its side. This to

me was the greatest wonder of the forest. The tree which it prostrated in falling has been burnt hollow, and is so large, a gentleman who accompanied us from Murphy's informed us, that when he first visited the place two years ago, he rode through it on horseback for 200 feet without stopping but at one spot as he entered at the root. We all walked many scores of feet through it, but a large piece of its side has fallen in near the head. But there are many standing whose magnitude absolutely oppresses the mind with awe. In one place three of these gigantic objects grow side by side, as if planted with special reference to their present appearance. Another, so monstrous as to absolutely compel you to walk around it, and even linger, is divided at from 50 to 100 feet from the ground into three of these straight mammoth trunks, towering over 300 feet into the sky. There are others whose proportions are as delicate, symmetrical, clean and straight as small Spruces, that rise 350 feet from the ground. In one spot a huge knot of some ancient prostrate giant is visible above the soil, where it fell ages ago, and the earth has accumulated so as nearly to obliterate all traces of its former existence. The wood of this tree, I am told by Mr. Lapham, is remarkable for its slow decay. When first cut down its fibre is white, but it soon becomes reddish, and long exposure makes it as dark as mahogany; it is soft, and resembles in some respects Pine and Cedar. Its bark, however, is much unlike these trees; nearest the ground it is prodigiously thick, fibrous, and when pressed on has a peculiar feeling of elasticity. In some places it is 18 inches thick, and resembles a mass of Cocoa-nut husks, thickly matted and pressed together, only the fibrous material is exceedingly fine, and altogether unlike the husk of the Cocoa-nut. This bark is fissured irregularly with numerous indentations, which give it the appearance of great inequality and roughness. At 150 feet from the ground it is only about 2 inches thick on the living tree, which is now being stripped of its bark for transportation from the country. An hotel is built near the 'Big Tree,' whose bark was stripped last year and exhibited in San Francisco; and an appendage of the house is built over it, so as to constitute a hall for cotillion parties. At the root it measures 96 feet in circumference, and a portion of its prostrate trunk is used for a bowling alley. To overthrow it, holes were bored through with a large auger, and after the trunk was mostly separated, attempts were made to wedge and upset it. But its immense size and weight prevented the success of this undertaking, and on the fourth day it fell by the force of a strong wind. In falling, it convulsed the earth, and by its weight forced the soil from beneath it, so that it lies in a great trench, and mud and stones were driven near a hundred feet high, where they have left their marks on neighbouring trees." The following paragraph bears very hard upon Dr. Lindley. [It is too rich to be omitted.] "The name that has been applied to this tree by Professor Lindley, an English botanist, is Wellingtonia gigantea. By him it is declared to be so much unlike other Coniferæ, as not only to be a new species, but to require description as a new genus. Other botanists of eminence think differently. To this, however, he has seen fit to apply the name of an English hero, a step indicating as much personal arrogance or weakness as scientific indelicacy; for it must have been a prominent idea in the mind of that person that American naturalists would regard with surprise and reluctance the application of a British name, however meritoriously honoured, when a name so worthy of immortal honour and renown as that of Washington would strike the mind of the world as far more suitable to the most gigantic and remarkable vegetable wonder indigenous to a country where his name is the most distinguished ornament. As he and his generation declared themselves independent of all English rule and political dictation, so American naturalists must in this case express their respectful dissent from all British scientific 'stamp acts.' If the 'Big Tree' be a Taxodium, let it be called now and for ever Taxodium Washingtonium. If it should be properly ranked as a new genus, then let it be called to the end of time Washingtonia Californica. The generic name indicates unparalleled greatness and grandeur; its specific name, the only locality in the world where it is found. No names can be more appropriate; and if it be in accordance with the views of American botanists, I trust the scientific honour of our country may be vindicated from foreign indelicacy by boldly discarding the name now applied to it, and by affixing to it that of the immortal man whose memory we all love and honour, and teach our children to adore. Under any and all circumstances, however, whether of perpetuity or extinction, the name of Wellington should be discarded, and that of Washington attached to it, and transmitted to the schools of future ages."—*Hooker's Journal of Botany.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—In mixed conservatories, that is houses containing the principal display of bloom, and a miscellaneous collection of greenhouse plants, the use of fire-heat should be avoided as much as possible, for although artificial warmth is useful to most plants in bloom, it is injurious to many hard-wooded things which flower late in spring, and should be sparingly used where these have to be wintered in the conservatory. It is almost impossible, however, to give precise directions as to the temperature which should be maintained, for very much depends upon the kind of plants which the house may contain, and also upon the character of the house itself, that only general directions can be given, and these must be accommodated to the particular circumstances of each case. Where Camellias, Epacrises, Heaths, and other greenhouse things form the principal floral display, 40° at night by fire-heat will be quite sufficient, but where the hardier stove plants or forced things are used for the decoration of this house, 45° will be the proper mean night temperature.

FORCING DEPARTMENT.

PINERY.—A night temperature of about 60° should be maintained in the fruiting pits, allowing it to rise to 70° during the day, or 75° with sunshine, and where the fruit is approaching maturity 5° higher may be maintained if this can be done without injury to the general stock. Also aim at keeping up a steady bottom-heat of about 80°, which for the present will be high enough. —The Vines in houses about to be started should receive a dressing with the ordinary composition a few days before closing the house, rubbing it well into the crevices of the bark; also get the outside border covered if not already done; this, however, should always be effected before this season, so as to retain a portion of the warmth infused by the summer's sun, and throw off heavy rains. Where very early Melons are required, seed of some established favourite should be got in at once. Cucumbers being very generally grown for early use, it is scarcely necessary to refer to these farther here than to say that, if not already done, seed should be sown at once. These and Melons require plenty of light and moisture, and every care should be used to keep them clear of insects, and this renders it adviseable to have them in a light by themselves. A small quantity of Strawberry plants may now be placed in a pit or frame where a temperature of about 45° can be maintained, keeping them close to the glass, and giving abundance of air whenever the weather will permit.

FLOWER GARDEN AND SHRUBBERIES.

Where any of the beds or borders require a dressing of fresh soil this should be provided, in order to have it in readiness to wheel on when favourable weather for such work may occur. Fresh soil is, in most cases, preferable as a dressing for flower beds to manure, which is apt to cause too luxuriant a growth for a first-rate display of flowers. On soils that are naturally poor, however, and where neither fresh soil nor decayed leaves can be had, a moderate dressing of well rotted farm-yard manure will be useful; but this should be well mixed with the soil to the full depth of the bed, and not carelessly turned in and left in lumps near the surface; for in this case a gross habit of growth would be promoted early in the season, and as the principal part of the roots would be near the surface in the manure, the plants would soon feel the effects of dry weather, whereas if the manure were well incorporated with the soil, to the depth of about 18 inches, no ordinary amount of dry weather would injure the plants after they once got fairly established. Shrubberies may be thinned where this involves only the cutting out of overgrown plants or loping deciduous trees or the hardier kinds of evergreens; but where evergreens generally require pruning, the work had better be deferred until March, except in favourable localities; for although when the winter proves mild such work may safely be performed at any time, it is never safe to depend upon this. Avoid getting upon, or working the ground when it is in a sodden state, and if the hands cannot be profitably employed at out-door work, get a good stock of pegs, Dahlia stakes, tallies, brooms, &c., prepared and stored away in an orderly manner, so as to be ready for use when wanted.

HARDY FRUIT AND KITCHEN GARDEN.

If any transplanting of fruit trees has yet to be done this season, it should be seen to while the weather is favourable for such work; also see to getting ground intended to be planted with young trees prepared, and spare no pains or expense to have this properly done, remembering that future success will very largely depend upon how this is effected. Make sure of thorough drainage, and where the subsoil is unkind this should be removed, replacing it with some good fresh loam. When a large breadth has to be planted in one season this expensive kind of preparation cannot always be afforded, but it is better to do such work only in such quantities as will allow of every precaution being used to ensure success, and it is useless to hope for this on some soils without making expensive preparations before planting. Get pruning and nailing forwarded as fast as circumstances will permit. Attend to keeping up a supply of Seakale, Rhubarb, and Asparagus, according to the demand and convenience, by introducing quantities of the roots into heat at intervals of about a fortnight. Where there is room to spare in the Mushroom-house, the two former will be found to do exceedingly well there, and a supply will be obtained with very little trouble. A quantity of roots should be got up and laid in where they can be covered in case of severe frost, so as to avoid the chance of having to take them up when the ground is frozen hard. Also see to providing a supply of French Beans. These are frequently grown in the early Vineries or in plant houses, but their liability to the attacks of red spider renders them dangerous inmates of such structures, and where it can possibly be done they should be grown in a pit devoted to such purposes.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Jan. 4, 1855, as observed at the Horticultural Gardens.

Dec. and Jan.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth 1 foot deep.	Temperature. Of the Earth 2 feet deep.	Wind

The amount of Rain in 1854 is about 5 inches below the average.

Notices to Correspondents.

BOX EDGINGS: *P E.* In answer to your inquiry as to whether, in relaying Box-edgings, the surplus Box belongs to the landlord or tenant, we have to say that it is a legal question which can only be answered upon a full knowledge of the circumstances.

IMPATIENS HOOKERI: *O B.* A plant of this Balsam is now in full bloom in the Horticultural Society's Garden, and a very beautiful thing it is.

INSECTS: *W C, Edgeware.* The insects sent by you as injurious to Cabbages and French Beans are of two distinct kinds, belonging to distinct orders; the small ones therefore are not the young of the larger. The former are a small species of spring-tailed insects (Podura fimetaria) common in gardens, especially among semi-decayed vegetable matter; the larger one is a small species of Julus or snake millepede. This attacks the roots of living vegetables, and can only be got rid of by a careful cleansing of the soil. *W.*

NAMES OF FRUITS: *R T R.* 2, Winter Nelis, and 3 is Ne Plus Meuris; you have therefore not got Knight's Monarch. The Apple No. 1 is Sturmer Pippin; 2, Mannington's Pearmain. The other specimen of Winter Nelis is larger than usual. Beurré Diel which you state to have grown 18 ounces, Easter Beurré 14½, and Chaumontel 14 ounces, are above the usual size of these varieties.—*R Robertson.* 1, Althorp Crassane; 3, Bezi de la Motte; 4, Vicar of Winkfield; 5, Duchesse d'Angoulême; 6, Too far gone—probably Sucré Vert; 7, Forelle.—*Aberdeenshire.* 1, Reinette du Canada; 2, Blenheim Pippin; 3, Beurré Diel, a very good specimen; 4, Easter Beurré; 5, probably Marie Louise from a late blossom.—*E Pike.* The Pear is Glou Morceau; the Apple is not known, appears to be only fit for Cider. ‖

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*F A P.* Yes; see answers to correspondents in last week's Paper. *S.*

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE 10, Mark Lane, London.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.
BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM-ENGINES, AND COMBINED THRASHING, STRAW SHAKING, RIDDLING, AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as thrashed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. and Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading agricultural shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

HOSE PIPING.—GREAT REDUCTION IN PRICE.
PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.
BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

WEEDS ON WALKS.
MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.
SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.
Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.
N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

		Galvanised.	Japanned iron.
2-inch mesh,	light, 24 inches wide	... 7*d.* per yd.	5*d.* per yd.
2-inch „	strong „	... 9 „	6½ „
2-inch „	extra strong „	... 12 „	9 „
1⅝-inch „	light „	... 8 „	6 „
1⅝-inch „	strong „	... 10 „	8 „
1⅝-inch „	extra strong „	... 14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.
Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

RUSSIA SUPERSEDED IN THE GROWTH OF HEMP AND FLAX. ENGLAND FOR THE NECESSARIES OF LIFE INDEPENDENT OF ALL NATIONS. By an Improved Mode of Vegetation Two Crops, nay Three Crops, and for Cattle Eight Crops annually.
A LECTURE will be delivered on the above subject by Mr. WILKINS, Patentee, at the City of London Tavern, Bishopsgate Street (City), on THURSDAY next, January 11th, at 8 o'clock in the evening precisely. The Hemp, Flax Roots, &c., &c., will be exhibited.
Terms of admission moderate, which will be announced in the *Times*, *Daily News*, and other papers on Wednesday or Thursday next.
After payment of lecture expenses, surplus to the Patriotic Fund. Botany and Portable Garden, which will move with the Sun, to be referred to. Tickets may be had on Wednesday and Thursday next, at the place of lecture, City,
Patentee's Motto—"Do good and communicate."
Walworth, Surrey, Jan. 6.

JOHN MORREN, GENERAL COMMISSION AGENT, Ock Street, Abingdon, is open for Commissions for the sale of Agricultural Implements, Manures, Seeds, &c., and for the purchase of Corn, &c.

The Agricultural Gazette.

SATURDAY, JANUARY 6, 1855.

MEETINGS FOR THE ENSUING WEEK.
THURSDAY, Jan. 11—Agricultural Imp. Society of Ireland.

To the general reader of periodical literature there is not a more curious study presented during the year than the various introductory essays which are called forth by its commencement. Cast your eyes where you will, be it Magazine or Review, Newspaper weekly or daily; be the subject what it may, science, literature, politics, or gossip,—from the 'leading article' down to the advertisements, in one shape or another, with view prospective or retrospective, in tone promise-full or regretful—everywhere you knock your head against 'the New Year,' saluted after many fashions and in many strains,—sentimental or prosaic, moralising, or puffing. There are moments when one is half tempted to vote the good old custom more honoured in the breach than the observance, occasions again when the happy phrase or well-pointed reflection revokes at once the undutiful thought, reminding us that we can never be too often reminded of the preciousness not less of Change and Season than of Time itself; but above all of that season which, standing at the margin of the new page of time, commends a moment for reflection even to the busiest wayfarer of life. All experience and observation, all that lies without man, or within him, exemplify the need at certain intervals of a fresh start: the feelings of our minds, as well as the labours of our hands suggest it, and outward nature confirms it.

But if any one more than another may be sensible of this, it should be the Farmer. Constant and never ending as is the round of his labours, yet the changes which Nature undergoes are to him the actual machinery by which he works, as Nature herself is his workshop. Yet it may be feared, and that, too, without departing very far from natural history, that here paradox is triumphant, and the very opposite of what one should expect is the fact. The deep-felt inward resolve to turn over, in the best sense, the new leaf that life presents to us, is apt to be least felt where the routine dependent upon change, has effaced the impression of the change itself. Flatter ourselves as we may with the here-and-there sound or sign of progress, a faith one would rather exaggerate than diminish, it is yet impossible to contemplate the amount of wealth employed, the number of individuals engaged, the breadth of the social state represented by agriculture in this country, and not feel that its importance in each and all of these respects is, beyond all due proportion with other pursuits, in advance of its intellectual condition. Pampered, as some supposed, but more truly speaking, drugged and stupefied by false patronage based on false politics for nearly half a century's legislation, till it verily believed the

tale that it was not in its own power to stand upon its own legs, it has awakened but recently to find what all things and persons long cramped and enervated by artificial aids and stimulants must find, that self-reliance long suspended has not only sacrificed strength, but lost time and stunted *growth*, leaving the individual behindhand, and with much ground to make up, in the race of social progress.

Look at the question of Agricultural Statistics; look at the question of farming tenures; take the subject of farm-buildings, the feeding of stock, the adulteration of manures, the collection, and the application of town-sewage; last not least, look at that Augean Stable of accumulated rubbish that blocks up and stifles the sale and purchase of land: will anybody acquainted with the state of opinion in the agricultural world upon these subjects, say that they are in a condition, we will not say of fair progress, but of respectable debate? All these are questions in different degrees vital to agriculture, questions that, perhaps with one exception, might have been discussed fifty years ago as well and usefully as now. Look at them, as you would into a horse's mouth, and say how many years' *discussion* do they show? Compare them now, after forty years of peace, with the cotemporaneous progress made in the other industrial arts. While the sea was girt by steamvessels, the land by railroads, and both by the electric telegraphs, what has been done for the soil? While even lawyers have been reforming and simplifying their procedure in other respects, what have the owners, or the occupiers of the soil obtained from them, or attempted for themselves towards the emancipation of *their article* from a thraldom which in proportion as makes it unfitted for the market, reduces by so much its market value.

Nothing but the magnitude of the scale, or to use a phrase of more common coinage, 'the importance of the interest' blinds or dulls the public eye to the anomalies that oppress the Commerce of the Soil. Let any man of business expert in the transfer of any other description of 'stock' that the world contains—that man acquires employs or improves to the behoof or service of his brother man, by the application of labour capital, or both,—examine the incidents attendant on the sale, or the hiring, of a hundred acres of land; let him study the title, and the costs, of the 'purchaser' in the one case, or the tenure taken by the 'tenant' in the other; let him simply draw for himself the conclusion which would occur to one regarding the transactions from a purely mercantile point of view: let him then look at the distribution of land in *ownership* in this country, on the one hand, and the *average condition* of land *rented* on the other: and in aid of his conclusion let us suppose him, in addition to his mercantile experience possessed of the skill of the lawyer without his habituated tolerance of fiction, the practical knowledge of the farmer without his devotion to routine. We believe the conclusion he would be driven to would be that the subject of the economy of the soil lingers in a state of semi-feudal infancy; that the marks remain upon it of some latent cause long operating to check the progress of material civilisation, in this regard, and to give an exceptional character to the dealings between man and man in all that relates to The Soil.

Let us, however, look at this question by the light of a comparison recently instituted by a great historian of our day between the agricultural systems in Great Britain and in Russia. After alluding to the annual stream of emigration of nearly 350,000 a year from the British Islands, and asserting that "such prodigious drains springing out of the *passions and necessities* of civilisation cannot go on for any length of time without seriously weakening the strength and lessening the population," (as if an overflowing and a declining population could be a permanently co-existing condition); he proceeds as follows:—

"To this it must be added that the introduction of the free-trade system into Great Britain has already given a very great impulse to agricultural industry in Russia, where it is advancing as rapidly *as it is declining in the British Islands*. As this change has arisen from the necessary effect of the wealth, civilisation, and *advanced years* of the British Empire, so there is no chance of its undergoing any alteration, and it must come every day to evince a more powerful influence on the relative strength and fortunes of the two empires. Even before the free-trade system had been two years established in Great Britain, it had, despite the rude system of agriculture there prevalent, nearly doubled the exportation of grain from the harbours of Russia, and tripled its value, while it has caused the production of cereal crops in the British Islands to decline 4,000,000 quarters. The effect of such a continued and increasing augmentation on the one side, and decline on the other, cannot fail ere long to exercise a powerful influence on the fortunes and relative strength of the two empires; and when it is recollected that the increase is given to a young and rising, and *the drain* taken from an old and stationary state, it may easily be foreseen how important in a short time the difference must become." *Alison's Hist. of Europe;* vol. ii., p. 165 [1815—52].

By which we are given to understand, 1st, that an overflowing and enterprising population is a sort of senile dysentery, a 'drain' incident to states that are grown old, and so strangely tortured by the complicated maladies of age, as to be overflowing, declining, and *stationary*, all at once: 2ndly, that all the corn "shipped from the harbours of Russia" is Russian corn; it being but too well known that jealousy of the enormous increase (more than doubling, year upon year,) of the corn of Moldavia and Wallachia shipped at the principal Russian port of Odessa, with a corresponding *decline* of Russian trade, was not the least among the collateral motives which led to a certain 'material guarantee'—the invasion and occupation of *those provinces* by the troops of the Czar,—the infamous first act of the disastrous war in which we are involved. 3rdly, we are to believe, upon the instance of two or three wretched harvests in succession, in England, and the wholesome cessation of a forced and unnatural export from Ireland of a grain-crop unadapted to her soil and climate, (with rarity presenting the specimen of a perfect ear of *Wheat*,)—that "the production of cereal crops in the British Islands has *declined four million quarters!*"

But, if it had? If, that is to say, one *thirty-seventh* of the land, in England alone (to leave out Scotland and Ireland), once under Wheat, were now under some other crop—what then? If the writer could only have proceeded to show that one single acre was consigned to idleness, returned to normal rabbit-warren, gorse-bed, thicket, or morass,—that it was not in fact better employed—yes *better*—in virtue of this very importation of 'Russian' corn, the argument would have been followed out and had meaning. The answer to it, had it really any truth in fact, were this, that what everybody saw and remarked of every ill-managed farm he passed, what each owner felt and each tenant as well as agent knew upon each individual estate and farm, was equally true, of course, of the aggregate—viz., that the very thing wanted for the perfectionising of British agriculture was less grain-crop and *more green-crop*,—less corn and more meat, less hand-to-mouth farming and more stock: and the two or three years of cotemporaneous low price and low produce (traceable to the most obvious temporary causes), while doubtless a season of great agricultural depression, had the 'jewel' of adversity 'in its head,' and went no small way to effect what 'agricultural societies,' and 'farmers' clubs,' and 'improving owners,' and 'active agents,' and 'example farms,' and all the other recognised organs of 'agricultural improvement,' had laboured at with but modest results for many years, namely to get more beef and mutton out of the land trodden by the most beef-and-mutton-eating people in the world, and to employ British men, British horses, and British implements upon that branch of farming business which the nature of the climate especially favoured, and the habits of the people especially required.

BURKE was wont to say that the unhappy conflict between England and her once American Colonies was begotten by a metaphor—that of the '*parent* state and the *offspring*.' Something of the same conviction occurs to one on contemplating the figure of Russian agriculture glori ed as that of "a young and rising state" by contrast with the "*advanced years* of the British empire." Defend us all from murder, manslaughter, and metaphor! If Moldavia and Wallachia are Russian provinces, and the corn grown there, Russian corn; if serf-labour is better than that of free men; if farming that takes "six cultivators to feed themselves and *one* other member of society" be in a fair way to overtake that of a country where "the labour of *one man* raises food for seven," [see ALISON'S "History of Europe," II., 127.]—then indeed is "agriculture advancing in Russia as rapidly as it is declining in the British Islands:" and if, on the other hand, a branch of British industry only just out of leading-strings, and suffered to walk without the fostering care of Parliament and the preventive arms of the Custom-house, and still employed upon a 'raw material' unemancipated from some of the costliest relics of 'feudal tenure,' be citable as an arm of British enterprise and skill past the meridian of national strength and progress and verging on decline, then indeed may the most unfavourable picture be true that the prejudice even of party-feeling can draw for Great Britain by the side of Russia, in a comparison of "the relative strength and future fortunes" of the two empires.

IN our next page will be found the measurements and weights of most of the cattle shown at Baker Street and Birmingham last month. We have specified in detail the girth and length of only those animals whose carcase weights we have since been able to obtain; but the averages given under each class are those of the whole of the animals shown in each,—so that these averages may serve as a record of the actual measurements of all the fat stock exhibited at these two shows. They will serve as records with which to compare the shows of future years. And while single instances of extraordinary weight are interesting as proofs of the early maturity to which, under the most favourable circumstances, cattle have attained, these general results will indicate with greater certainty the progress which is being generally made.

The table is interesting, too, as indicating the degree of certainty with which measurement furnishes the means of estimating weight. In an ordinary cattle guage (CAREY'S for instance), having set it to the ascertained girth and weight of the animal before you, the weight is read off at but one place; and though the *same* measurements might in different animals result in different weights of beef, according to the breed and age and sex and degree of fatness of the stock, nothing whatever is left to the judgment of the valuer in using such an instrument as this—his instrument gives but one weight for all these various cases.

In EWART'S cattle gauge,* however, the indications of the instrument are various, according to the estimate which the valuer makes of the influence of these several circumstances. He reads it differently according to the breed and fatness of the animal before him; and with a lot of animals of even quality and one breed, a very great degree of certainty is attainable. Excepting a few exceptional cases—by which an asterisk is placed in the table—the actual weight of the animals measured is very near indeed to the estimated weight; and we have given in three columns the weights read off, as "fat," and "very fat," and "extra fat" respectively; and it will be seen that, on the whole, the cattle were a "very fat" lot—those at Smithfield exceeding those at Birmingham in this respect. The general results given at the foot of the table prove, we think, that for estimating the value of *a number* of fat cattle, a little skill in measuring, and the very slight skill needed to determine the degree of fatness which the animals possess, will, with the use of this instrument, lead to as safe a judgment of their weight, and therefore of their value, as the longest and most matured market experience; the only difference—though we admit its great importance—being that the valuer in this way is not likely to have so much confidence in his own judgment. The rule for measuring is to take the girth immediately behind the shoulder, where it is least; and to take the length as the distance between two vertical lines, one of which lies on the general outline of the hind quarters, and the other cuts the shoulder blade just in front of its highest point.

As instances of extraordinarily early maturity among the cattle shown at Baker Street we may refer to Nos. 36 and 38 among the Hereford oxen, 2 years and 11 months old, and weighing 91½ and 100 stones respectively; and to 56, 60, 62, and 64 among the short-horn cattle, the same age as the Herefords, and varying in weight from 90 to 103 stones each—the latter being the weight of the Duke of RUTLAND'S prize ox, purchased by Mr. FERRIS, of Bath.

Among the sheep we note the following instances which have been furnished to us:—Lord WALSINGHAM'S pen of 32-month South Down wethers, bought by Mr. BANNISTER, of Threadneedle Street, weighed 483 lbs., besides 60 lbs. of loose fat. The pen shown by the Duke of RICHMOND, No. 195—three 20-month South Down wethers bred by his Grace—purchased by Mr. KING, of Paddington Street, weighed 390 lbs., which for animals so purely bred is astonishing. Indeed the South Down breed are rapidly becoming in actual weight what relatively to bulk they have long been, *i.e.*, the first of English breeds of sheep.

We may also refer to Mr. DAUGE'S pen of 21-month cross-bred wethers, weighing 40 lbs. a quarter, as another instance of very early maturity. The 20-month South Down and Leicester cross-bred wethers shown by Mr. OVERMAN, of Rayham, Norfolk, weighed 484 lbs., besides 50 lbs. of loose fat; and for extraordinary weight Mr. CLARKE'S 4 years and 8 months long-woolled ewe may be instanced, weighing 54 lbs. a quarter.

We add as an isolated fact that the only instance in which we have been provided with the live as well as carcase weight is in the case of the ox, No. 128, at Baker Street, purchased by Mr. TAYLOR, of Malton, which weighed 1104 lbs. alive, while its carcase weighed 771 lbs., or rather more than two-thirds of its living weight.

---

* Made by Mr. Tree, of Charlotte Street, Blackfriars Road

Home Correspondence.

Spade Husbandry.—I trust you will be good enough to give a place to the following remarks on spade husbandry, which I am surprised to find so strangely neglected in England in the face of our much and justly boasted agricultural progress. I believe the advantages of this mode of cultivation are fully admitted, the only objection being what is erroneously termed the expense. In this, as in all other cases, ignorance and prejudice are the greatest obstacles to advancement, for the spade or fork is held to be costly only because men *will* not try it. The Farmer's Almanac avers the expense of spade and plough to be much more nearly balanced than is generally imagined. Scientific men may astonish the world by producing implements, but there is no real digging machine but the able-bodied, expert, and industrious labourer. If you were to keep public attention fixed on this movement, we should soon have enterprising agriculturists in many districts, fairly testing the merits of the fork. Patience, perseverance, and impartiality are all the requisites. The increased comforts of our admirable agricultural population, the diminution of poor-rates, the vast superiority of the average yield of the land, the permanent improvement of the soil, and the economising of human food, will be found amongst the most powerful reasons in its favour. I wish myself in an humble way to give proof of my sincerity by practising what I preach; and I am seeking a small "garden farm," for I hold that agricultural returns depend more on the amount of capital judiciously invested, than on the actual extent of your farm; so I am of opinion that 50 acres worked to the highest degree will do much more than 150 acres in a slovenly way without capital, skill, or energy. I may add, in conclusion, that stock, the source of all profit, must be kept to the largest number the land can carry, for animal manure, liquid and solid, must follow the fork. *J. Hamilton.*

Deep and Shallow Draining.—A few weeks since, you stated that probably the generality of agriculturists, as well as Mr. Walton, were in favour of shallow draining. I am no theorist; I have drained rather extensively in several counties for the last 40 years, sometimes 30 inches, 3 feet, 4 feet, and not unfrequently 6 and 10 feet, according to localities and circumstances. In some places 30 inches, or 3 feet, prove more effectual than 4 feet; but the subsoil being, as Mr. Walton says, fine and good, I prefer the depth of 4 feet—partly because at 3 feet, in a dry season, both green and cereal crops will send their roots for moisture into the drains. The most durable and efficient drains, and in effect the most extraordinary, are those from 6 to 10 feet, driven up to the head of the spring, and often draining a great extent of valley land. It is the height of gullibility to believe that any distant practitioner can, without inspection, dictate the proper space apart and depth of drain for every locality. One fact of very remarkable importance relative to 4 feet draining has not been noticed, as far as I have learned, by any essayist in favour of that depth. It is now well known that under ordinary circumstances and weather, during a bright day, the rays of heat will penetrate the earth to the depth of 4 feet, and that during a following bright night the heat will be returned from the same depth; but if obstruction by a non-conducting body prevent the daily radiation, whether it be at 20 inches or 3 feet, the heat will be returned proportionately before the night be passed, and the surface, being consequently colder before day, will be covered with hoar frost long after it may have disappeared on the adjoining land. Every observing farmer in his early walks may have remarked this. In a soil such as Mr. Walton approves I have proved the capillary attraction of the water upwards in a drain to be from 6 to 9 inches, according to the nature of the subsoil. Suppose this constant moisture above a drain of 20 inches, with or without the sea below, and contrast it with a dry space of 4 feet daily penetrated by the sun's genial rays, and take your choice. *Thomas Landor, Burton.*

Green Vitriol.—I have been using green vitriol on my liquid manure tanks, and also on my long manure made principally in my cow sheds, believing that it was a cheap and valuable agent to fix the ammonia, and also speedily to decompose and make ready for use the long and green dung heap. Your able papers on Coveney's manure lead me to the conclusion that green vitriol is almost worthless as an agent; it certainly makes the dung-heap ready for use earlier than it otherwise would be—an object to me; but I suppose there is no means I could employ to render the phosphoric acid in it soluble. Shall I use up my remaining stock on the dung-heap or in the liquid manure tank, or what do you recommend me to do with it? Can you also recommend me a cheap and efficient deodoriser for the tanks, the stench from which is almost insufferable, and must be injurious to the man who pumps their contents into the liquid tumbler cart, one of Stratton's. *G. P., Bristol, Jan. 2.* [You had better sell what green vitriol you have remaining, and use charcoal dust or sulphuric acid to fix the ammonia of your tanks.]

Thin Seeding.—Messrs. Hardy, of Maldon, state the result of their garden experiments as follows:—

Time of Sowing and Transplanting.	Space allotted for each plant.	Number of Ears produced from each Grain.	Number of Grains in each Ear.	How many fold.	Quantity of Seed per Acre.	Quality of Produce.	Equal to the acreable yield.
	sq. ins.				pints.		bsh.
Sown 1st September for transplanting in Autumn	1296	80	80	6400	½	finest.	50
	144	20	60	1200	4½	finer.	84
	72	10	50	500	9	fine.	70
Sown in Autumn from October to December	7	1	50	50	64	fair.	50
	3½	½	25	25	128	thin.	25
	2	⅓	5	5	192	lean.	15

Grasses.—"Constant" will find the following mixture good for permanent Grass, upon strong damp soil, viz.:

	lbs.		lbs.
Alopecurus pratensis ...	3	Poa nemoralis sempervirens	3
Festuca duriuscula	3	Poa trivialis	3
Dactylis glomerata	6	Medicago lupulina	1½
Festuca pratensis	3	Trifolium pratense	1½
Lolium italicum...	6	" perenne	4½
" perenne...	12	" repens	6½
Phleum pratense	3		

I have sown the above mixture along with Wheat, Oats, and Barley, and likewise by itself. The seed will always succeed the best by itself, but not to a degree to compensate for the loss of a thin crop of Barley or Oats, which is always worth harvesting. The ground should be well prepared before the seed is sown; worked down into a fine state, to allow the roller to pass over, without the soil attaching to it. The seeds should be sown about the last week in April. If the seeds are sown by themselves, you will have a good crop of Grass for autumn use, to cut for green food or to eat down with cattle. In cutting the first year, it will be best only to take one crop from it, and eat the second crop down with stock upon dry days; by so doing it gives the finer kind of Grasses a better chance of establishing themselves, than by allowing the Clover to grow for a second crop. *J. Daniels, Woodside House.*

A good road is a great saving in horse-flesh, carts, and harness. If agriculturists would make a calculation of the difference of draught on a turnpike, or through a muddy lane or field, it would astonish them. In many instances one horse in three would not compensate for the increased friction and strain on a bad road. Taking these matters into consideration, it becomes a question whether the expense of keeping the ways about a farm in hard working order would not be repaid in a twelve-month by saving the damage and wear and tear, both to animals, waggons, and vehicles of every description. The exertion required to drag a load through deep ruts is most distressing to a team, and particularly injurious to young horses, who are often lamed incurably by the unnatural motion consequent upon the unequal draught. The jerk to extricate the wheels from the slough of despair is enough to rupture every sinew and spring every joint;—premature old age, or rather crippled youth, follows rough usage and over-work both in man and beast. Farmers must acknowledge 1854 to have been a remunerative year, with a bountiful harvest, more than an average, taking one crop with another; in thankfulness for such a blessing, farmers should open their purse strings, give liberal wages, and employ labour in improvements, though it may not produce direct profit—indirectly it will, if expended in repairing roads, dressing hedges, opening ditches, collecting and stifle-burning rubbish, and other odd jobs—fit occupations when frost, snow, or the wet state of the land make it injurious or impossible to till it. At these times how many poor industrious men are turned adrift because ploughing and harrowing cannot be followed, instead of which their valuable services should be turned to account in different ways, giving them an interest in what belong to their masters. There are unusual drains now thinning the population of the able-bodied, war, pestilence, and emigration. It would be wise to prevent the last of the three as much as possible, by finding plenty of work for the labouring classes at home. It is natural for men to wish to improve their condition, and they well know the facilities which exist for so doing out of England, and are, therefore, only too glad to leave the land of their birth, where it is so difficult to provide the necessaries of life for their families. At the same time, many who emigrate would rejoice to remain at home if the slightest encouragement was given them; a prospect of employment all the year round, with fair wages, would induce many an honest fellow to struggle on, rather than settle in a new country. Often is the following remark made—"The land wants plenty of hands and would pay for the labour; it is, therefore, hard upon us to be starving when we ought to be earning a livelihood, and putting money into our own pockets as well as our masters." This is true enough. The want of either energy, money, or charity, operates to continue the mistake of allowing the best men to go away, rather than use their sinews in improving property, because the return is not immediately visible, but indirect. There will be no use "in shutting the stable door when the horse is stolen." *Falcon.*

Payne's Defiance Revitt Wheat.—Although I have grown on one field a fine crop of this Wheat, our millers declined buying it, except at a reduction of 10*s.* per quarter, as compared with other red Wheat, and I hear the same complaint from others. The weight was good, about 62 lbs per bushel. Can you or your correspondents enlighten me as to whether this objection is well founded? I think the Rev. S. Smith, of Lois-Weedon, grows this kind of Wheat. *J. J. Mechi, Dec. 28th.* [All the cone Wheats, and excepting perhaps the April Wheat, all the bearded Wheats are of a coarser sort than the common whites and reds.]

Subterranean Application of Liquid Manure.—Amongst the curiosities of agriculture may be mentioned a new system of growing agricultural produce by applying liquid or sewage manure to the subsoil under the roots, about 16 to 18 inches deep. The plan has, I am told, been patented by Mr. Wilkins, at whose invitation myself and some other gentlemen investigated the operation, and estimated the results. On one side a number of plots or beds of soil were planted on the patent principle with Mangold Wurzel, Beet Root, Hemp, Potatoes, Cabbage, Lucerne, Italian Rye-grass, and Celery, each plot having opposite to it a similar bed

with similar soil *not* on the patent principle. The plants in both were sown the same day from the same parcel of seed, supplied by Messrs. Sutton, of Reading. I ought here to mention that the ground so occupied is close to the railway station, Reading, and occupies about one-sixth of an acre. The contrast in every crop, on every bed, was very striking, the produce of the patent beds showing an increase in quantity of from 400 to 600 per cent. The plan is simply this: a floor is paved with brick or concrete at a depth of 16 inches from the surface, with a rim or brick on edge 4½ ins. deep, like a tray; half round pipes are placed on the floor in a line under the intended row of plants. These pipes are at the end connected with a vertical pipe reaching to the surface, down which the liquid-manure is poured, and thus conducted to the half round pipes below. Of course the earth is filled in to the level of the surrounding soil, and the seeds sown over the line of the subterranean pipes. Liquid-manure had been applied weekly through the pipes on the patent beds, but none on the others, except on one where the manure each time had been applied on the surface to Mangold Wurzel, which were very inferior to those on the patented bed. Several questions arise on this experiment, first, whether the return will repay the cost, and, if so, whether the sewage of towns could not be largely and usefully applied as a manure. There was a remarkable appearance of quality and luxuriance about all the crops so treated, an absence of fangs, a delicacy of root compared with the ordinary process, and evidence of very rapid growth. One Potato planted in June had bines 5 feet long and numerous Potatoes, one of which weighed 2 lbs., although the parent one was small and of a small stock. The corresponding one on the opposite bed was very inferior in product. The former had sent down a strong root to the neighbourhood of the subterranean pipes, and had there multiplied its fibres most abundantly. The Carrot had gone directly down to the liquid as straight as an arrow, whilst its competitor in the opposite bed was short and fanged. The most extraordinary result was its effect on Turnip seed sown in September on the surface. The seeds all vegetated, and the plants were vigorous on the patent side; on the other a total failure, except one or two stunted and crippled plants. The same principle is applied to flowers in pots and vases, and an ingenious arrangement is proposed, by which all the plants in a mansion may be simultaneously supplied with liquid from a single pipe, thus converting the sewage of the house to an elegant result. The flowers which I saw growing on this principle were luxuriant. The whole question is worthy of a serious investigation. I remember that my neighbour, Sir John Tyrrell, in Essex, grew some luxuriant Celery by applying manure in a somewhat similar manner. Plants can do everything but speak—they will hunt for what suits them. By introducing a single fibre into a drain of running water, they will multiply it ten thousand fold to absorb all the moisture for their circulation; we do not give vegetation credit enough for sagacity, although its vitality and pulsation are as obvious (through a microscope) as our own. I have known an Apple tree in my garden convert leather into Apples, and could adduce surprising anecdotes of vegetative intelligence. I think Mr. Raynbird testified to some interesting results of Mr. Wilkins' process at Woking last year. If the cost of paving, &c., were even 100*l.* per acre, it becomes a question whether the rapid growth and increase might not afford an ample interest and profit. I should add that means are provided during winter to remove superfluous water. From a close examination of this system I deduce the conclusion that "fanginess" in roots is produced or avoided by the quality of soil and position and condition of manure. The soil in which this operation was effected was sandy. In clays it might or might not answer as well. *J. J. Mechi, Tiptree, Dec. 29.*

Farmers' Clubs.

EAST OF BERWICKSHIRE.—*Reaping Machines.*—At the late half-yearly meeting of this Society the secretary read the queries respecting the working of reaping machines, which had been addressed to those farmers in the district who had worked the machines during the last harvest: we will give a few of the replies.

From Capt. Logan Home, Broomhouse.—Bell's improved by Crosskill cut on an average about 7 acres of Oats per diem, the crop standing upright. Four horses were used each day, viz., two in the forenoon and two in the afternoon, and were kept in harness about five hours each time. One man was employed steering the machine and one driving the horses, and nine persons were employed in taking up the corn, binding and stooking. I calculate the expense to be about 6*s.* an acre, viz., 1*s.* an acre for cutting and 5*s.* an acre for taking up, binding, and stooking. In this calculation I charge nothing for the horses.

From Mr. Dagleish, West Blanerne.—M'Cormack's reaper cut 37 acres in 40¾ hours, 20 acres of which was a very strong crop of Wheat grown upon a steep bank, and 10 acres Black Oats, also a very heavy crop and partially laid. Bell's reaper cut 62 acres in 91 hours—Oats, Barley, and Wheat; none of them so heavy as what was cut with M'Cormack's. The horses were generally changed every four hours, although they have gone a whole day in M'Cormack's, but I found four hours quite enough for Bell's. Two men went with each reaper. M'Cormack's requires eight people taking up and four to bind and stook 10 to 12 acres a day; they easily managed 12 acres of Wheat. With Bell's eight takers up and four binders and stookers will do 7 to 8 acres a day. I may add in conclusion that both myself and the whole of my people are decidedly in favour of M'Cormack's reaper, it not being liable to go out of repair, while it is so easy work for the horses.

From Mr. Turnbull, Kelloemains.—Bell's Crosskill's cut where no stoppages occurred was about an imperial acre per hour, requiring the horse to walk about the rate of three miles an hour. Four horses will work the machine 12 hours a day—3 hours per yoking. The expense of cutting and binding per acre will be about 6*s.*; the rate of wages being for women 16*s.*, and for the men 17*s.* per week, but no charge is made for the horses.

From Mr. Dove, Eccles Newton.—Bell's original machine cut about 70 acres Wheat and Oats, and 20 acres Beans, and at the rate of about 5 acres per day. I used two different pair of horses. When the machine was working well I changed them every three hours, but when there were many stoppages from derangement of the machinery, as was very often the case, they went on for half a day. I found that a pair of horses could cut 3 acres at a time without being much distressed. I employed two men, a driver and a steerer. I did not lift the corn after the machine. The weather was so fine this season that I let it lie in the swathe till it was ready for leading, and the lifters were seldom in the same field as the machine. I calculate the expense of cutting with my machine this season at 8*s.* per acre, viz., interest on price of machine and tear and wear, and repairs on do., 2*s.* per acre; men attending do., and feeding horses, 2*s.* per acre; lifting and binding, 4*s.* per acre. This season the corn was in such fine condition after lying a week in the swathe that it did not require to be stooked, so I just sent the carts after the binders had led it home. Had it required stooking it would have cost about 1*s.* per acre additional. I have not allowed anything for the horses except the corn they ate; had they not been working in the machine they would be idle and out at Grass.

Mr. Wilson, Edington Mains, used two of these machines—one of them Bell's original machine, with the clipping parts; the other Bell's as made by Crosskill. He found the latter much better than the former, and less liable to derangement. Indeed, the result of his experience with Bell's clipping machine is that it requires an experienced workman to have at least a year's practice with it before he can work it properly, and even then it will not do its work well. He was in no case able to reap an entire field with this machine. With the two machines, as nearly as he could estimate, he reaped 150 acres. The two machines reaped 32 acres, fully, of Oats, in two consecutive days, and that notwithstanding great interruptions. The machine-cut corn he found to get into condition for the stacks sooner than the hand cut, because it got less knocked about. He used two pair of horses, and seldom worked them more than three hours at a time. The horses were able to go on day after day with the work he spoke of. He was unable to give an exact account of the cost of work. He was harassed with several unfortunate stoppages, most of them were pure accidents, for which the machine was not responsible; but some of them, he thought, were easy of remedy by the maker. He had no hesitation in saying that his harvest labour this year had been very much lightened by the machine.—Mr. D. M. Home read the report of a discussion at the Haddington Club, and the speakers there give the expense at about 5*s.* per acre. Mr. Hope, Fentonbarns, who cut nearly 80 acres with Crosskill's machine, says that the expense was about 5*s.* 6*d.* per acre; whereas for cutting with the hand it would have cost him 11*s.* per acre, and the machine made much better work. Mr. Anderson, Blackdykes, cut 50 acres. Mr. Hunter, of Thurston, cut 260 acres at an estimated expense of 8*s.* 6*d.*, a charge being made for two pair of horses per day. Mr. John Hope, of Elphingston, during last harvest cut 79 acres with the sickle, 85 with the scythe, and 35 with the reaper. The three scythes cut 18 acres in four days at 9*s.* 9*d.* per acre. Bell's reaper cut 15 acres in two days at a cost of 4*l.* 1*s.*, or 5*s.* 5*d.* per acre. Twelve acres of Oats cut with the sickle cost 10*l.* 2*s.*, or 16*s.* 10*d.* per acre. They might hope that when their farm servants get more accustomed to the machine it will do more work than it now does; and that when their farms are improved—made more level, and the stones removed—it will cut still more. *Abridged from the Berwick Warder.*

OXFORD: *Subterranean Application of Liquid Manure.*—At the late monthly meeting of this Club Mr. Wilkins stated that he had taken a spot of ground near the Great Western Railway Station, which he called his experimental garden. He had selected a piece of ground 100 feet square, which he had prepared on his patent principle, and by the side of it he had 100 feet square of the same kind of soil, which was treated on the old system. Both pieces were sown and planted alike, and he had advertised the day when the roots on both would be taken up, and invited the public to come and see the results, and judge for themselves. Those results were—that on the prepared piece the Mangold Wurzel grown was at the rate of 69 tons, 2 qrs., and 22 lbs. to the acre; the Indian corn grown on it ripened and came to perfection, but not on the unprepared piece; the Potatoes were taken up in 11 weeks, and when weighed in the presence of several gentlemen were found to be more than double the weight of those grown on the unprepared piece; the Winter Broccoli was taken up and eaten before winter came; and one of the Cabbages weighed 16 lbs., although its stem remained in the ground, and had now upon it 15 young Cabbages. In the prepared bed he had planted a Potato which he had picked up at Wokingham; it was about the size of a Walnut when he put it in, and it was taken up in the presence of Mr. Mechi and others, when the haulm was found to be 5 feet long; the produce was 17 Potatoes, weighing 8½ lbs., one of them weighing above 2 lbs. [This latter Mr. Wilkins produced, and handed round the room.] They were 13 weeks growing, and were planted in the early part of June. Mr. Wilkins then exhibited some Lucerne, which, he said, was the third cut, and contrasted it with the first cut of some grown on the old system. There was a very marked difference in favour of the Lucerne grown on the new principle, and the same might be said of the Italian Rye-grass, the fifth cut of some on the new system being contrasted with some of the old. The Mangold Wurzel exhibited also showed the superiority of the new system, where the roots varied from 12 to 18 lbs., while on the unprepared piece they did not exceed 6 lbs. The lecturer then exhibited some remarkably fine specimens of Hemp and Flax grown at Wokingham, adjoining some land belonging to Mr. Walter, of the *Times*, where nothing would grow. He showed some of the first crop of Hemp, which was 7 feet long, and the second was 5 feet; he stated that he had grown two crops of Hemp and Flax in the year on the land at Wokingham, which was the poorest he had ever seen. The Flax was grown in 12 weeks. The lecturer then explained that the principle of his system was to apply the liquid manure to the roots of the plant instead of above, because the tip of the root was the mouth of the plant, and the means by which it sucked up moisture and sustenance. He then exhibited a model of his process, a small box, with a waterproof bottom and sides, 4 inches deep. At one corner was a pipe for conveying the liquid manure to the bottom, which was distributed by means of a half-drain pipe laid along the bottom; in another corner was a pipe to enable any one to see if there was the necessary quantity of liquid manure, 4 inches; and in the opposite corner was a plug, by lifting up of which the liquid manure could be reduced, or pass off altogether into the soil below. The depth of earth necessary would be from 12 to 18 inches. At present he was constructing these waterproof beds of tile, the cost of which would be about 100*l.* per acre, but he believed that a much cheaper mode might be adopted by making the waterproof bottom of gas-tar and sand, in which case it would not exceed 50*l.* per acre. Even at 100*l.* per acre, and if it were done by the landlord, who should have 10*l.* per cent. for his outlay, he was prepared to prove that, after paying that 10*l.* per cent., the tenant should clear 30*l.* per annum on every acre, however bad the land might be [!!]

Notices of Books.

Hints on Agriculture, adapted to a Midland County. Hamilton, Adams and Co.

THIS is a little tract written by a lady who succeeds, as many of her sex have done, in uniting an acquaintance with the field work of the farm with a knowledge of household duties, and a sympathy with all that is kind and elegant in social life—all which is proved in the contents of these few pages, in the dedication by which they are prefaced, and the poetry by which they are garnished. The thing is necessarily as slight as it can be, and we do not quite agree in some of its advice. You cannot pull a Thistle "too soon," (p. 15,) whatever old sayings may exist to the contrary. And we do not need to go so far as page 15 for what appear to us mistakes. The opening page, speaking of levelling land after draining, describes a very imperfect mode of conducting the operation. The tract nevertheless contains, in very small compass, a good deal of useful information.

Flax and Hemp, and their Culture and Manipulation. By E. S. Delamer, author of "Pigeons and Rabbits.' E. Routledge & Co.

A shilling volume containing in full detail all the information that is needed for the cultivation of these crops. It is strictly manipulation that is described. The machinery for removing the seed, for rippling, and for breaking and scutching the Flax is altogether ignored. And a good deal of extract matter from the writings of Mr. Warnes and others leads us to suppose that the writer may not himself be practically acquainted with the management and handling of the crop as cultivated and prepared for market, at least in this country.

Calendar of Operations.

JANUARY.

WEST SUSSEX, *Jan.* 2.—We have got to the time of the year when everything looks the most cheerless; but the weather is now such as would be suitable for March or April. It is dry and mild, and there has been but little frost, which soon disappeared. As a matter of course the mildness of the season has shown its effect upon the Wheat, which now looks very forward, the earliest sown rather too much so; it begins to assume rather a grassy appearance, but we shall, no doubt, have a little frost to check it yet. With anything like a fine season we may look for a good crop, for it was never put in in better order; the land was just in the state in which it works best—neither too wet nor too dry. The price still rules high, and we do not think that it is likely to fall, for there has been a large quantity threshed; since it was harvested it has been fit for the market, and prices being tempting all have sent it in. There is rather more than an average sown, and there will yet be a good deal put in after Turnips, the land being in such good order for it. Barley has turned out well both as to quantity and quality, but has not maintained its price so well; at one time it got up to 40*s.* or over, but lately it has given way a little. Oats turn out well and are heavier than usual; the price from 28*s.* to 30*s.* Peas have this year done far better than they generally get credit for; we never saw the quality better, if so good; but Beans have been all but a failure. Cattle are now confined to the yards or tied up in stalls for fatting, but this is not very encouraging; the Swedes, which we thought right in quality if not in bulk, do not seem to possess much fatting property in them. We rather think that they do harm if given in full allowance as we generally give them. [How much?] We find the cattle do better on half allowance, with 2 lbs. extra cake instead of the other half. And this arrangement, owing to the smallness of the crop, suits us better so far. Cake is dear, but as that is the case with everything we must not take notice of it, for it certainly will not do to shorten our allowance. Turnips, on which our ewes depend mostly, have turned out very bad, though they looked at one time well—the dry season beat them—and there are now patches of them rotted entirely off; we fear those left are more or less diseased and will be anything but healthy. This is no doubt partly the case with the Swedes—hence their little value, but Mangold, progressing more naturally, we may expect to be more sound. We have now begun to mix them with Swedes for the fatting beasts. The ewes have commenced to lamb, and appear very healthy; there is no lameness among them, as was the case last year, which may of course be accounted for by wetness of the one season and dryness of the other. We do not let them have Turnips until they lamb, but they have the

run on their pasture and what hay they choose to eat, care being taken not to let them out of their fold in the morning before the frost is off, if there is any, as we have seen great mischief done by causing slipping lambs from this cause. The weather having been so open we have not heard of that scarcity of hay that we expected; but still the price is high—from 90*s.* to 100*s.* for good meadow hay, and good Clover 10*s.* to 15*s.* higher. The young Clovers that looked so very bad after the corn was cut have now pretty generally made their appearance, and we may expect that they will turn out as usual. All artificial spring food, such as Rye and Tares, look well, so that the want of roots will not be so much felt. All work is now well advanced; there is little to do in the fields; the chief labour is threshing, driving dung, and chalk for the heavier lands, and repairing roads. *G. S.*

Miscellaneous.

Poultry Keeping.—On my way to Birmingham on Tuesday last, I fell in with some amateurs who were going to the Poultry Show for the first time. In the course of conversation the oft-repeated question was put to me, "What fowls should I keep?" As I had had experience of what are considered the most useful sorts, I answered as follows:—

1. Game Fowls.—Elegant and compact in appearance, hardy in constitution, excellent caterers for themselves, good layers of delicious eggs, excellent mothers and rearers of children, chickens unsurpassed in flavour when dressed. The sole drawback to this prince of breeds is their disposition to fight; but I cannot say that this amounts to much, as during the time I kept them I lost but four or five chickens from this cause.

2. Spanish.—Noble birds, abundant layers of very large eggs, may be kept in confined spaces more readily than other breeds, no mothers, but the chickens hardy, only wanting extra attention at about a month to six weeks old when feathering, good table-bird—should be well kept.

3. Dorking.—Genuine old English fowl, somewhat delicate in constitution, and seems to thrive most on warm and dry soils, eggs large and well-flavoured but not abundant, fair mothers, chickens not so easy to rear as other breeds, splendid table-fowl where a large plump bird is preferred, wants liberal keep and warm housing.

4. Gold and Silver Pencilled Hamburgs.—Extremely elegant in appearance, forage well for their living, but require more feeding than the Game Fowl, lay abundantly, but small eggs, never incubate, or but very rarely; chickens somewhat difficult to rear, unless in very favoured spots; nice birds for eating, but small; must have a good range to keep them in health.

5. Spangled Hamburgs.—Very handsome, abundant layers, chickens tolerably hardy, and a very good bird for the table, their incubating qualities are seldom manifested, require a good run.

6. Polish.—Good layers, very elegant in form, rare incubators, chickens very delicate at first, warm housing indispensable.

7. Cochin.—Varied plumage, hardy, excellent eggs, and more abundant than any other breed, good mothers, chickens strong, and grow rapidly under good feeding, good for table at four months old but not after, require very liberal feeding, feathers valuable.

This was my answer to the question above stated. If you think it can be of any use to those about to commence a yard, pray print it. *Thomas Prater, in the Poultry Chronicle.*

Notices to Correspondents.

ACRE: *T P.* The following are its several dimensions:—

	Square yds.		Square yds.
Statute acre	4840	Cuningham	6250
Leicestershire... ...	2808¾	Westmoreland... ...	6760
Herefordshire	3226⅜	Irish	7840
Wiltshire	3630	W. Derby...	9000
Devonshire	4000	Cheshire	10,240
North Wales (customary)	3240	Scotch standard acre	6104·1281
Ditto ditto (erw)	4320	Dumbarton	6084·4/9
Cornish	5760	Inverness...	6150·4

The common statement is, that a Scotch acre is ⅝ of an imperial acre.

CHICKENS' DUNG: *Sub.* If you have several tons you had better make a compost of it with earth, and use it either in the garden or as a top dressing on the meadow, at the rate of a ton or so per acre. Do not mix lime with it.

FOOD FOR LAMBS: *R cum N.* will feel obliged to any of our correspondents for information whether the large field Cabbage is good food for lambs in August, September, and October. Lambs in the autumn are very liable to the scour from improper food; they require good keep, but not of too stimulating a nature—hence the inquiry.

GORSE: *A Constant Reader.* [See Blackie's Cyclopædia of Agriculture.] "The best sort to cultivate is Ulex strictus, so called, which is, however, thought to be merely a variety of the common whin. It is more herbaceous than the U. Europæus, though of smaller and slower growth—but it cannot be grown from seed. If it be selected, cuttings must be struck or layers obtained, and these must be transplanted into the field on which it is to be grown. The more common plan, however, is to sow the seed of U. Europæus. About 10 lbs. of seed may be sown per acre, in shallow rows, of any light soil, in the month of March; the rows may be 10 inches apart, and the best plan is to sow it just as Wheat is sown in some districts:—The men opening a shallow drill with a broad light hoe, sowing the seed along it, and then covering it with the earth taken in opening the next drill. It can thus be sown for about 6*s.* an acre; and if 8 or 10 lbs. of seed, at 1*s.* a lb., be used, the first cost of the crop is not very great. Some people, however, recommend a larger quantity, and sow it broadcast; this is not a good plan, for the only difficulty which the crop has to withstand arises from the obstruction of its early growth by means of weeds, and these can, of course, be much more easily extirpated under a drill husbandry of the crop. In the second autumn after sowing, having been cleaned at intervals during both the summers, the crop will have attained a growth rendering it worth cutting; but it is well to cut only every alternate row this time, leaving every other to attain a two and a half years' growth against the following autumn; and, by pursuing this method, the half of the field is each year harvested when two years old, having had the advantage of ample room for development, during the second year of its growth, by the removal of the alternate rows. It is cut with a short and heavy hook, within a few inches of the ground, and tied up in bundles. This is paid for at the rate of about 5*d.* per score of bundles, each weighing about 20 lbs. 2000 faggots may be the average produce of 1 acre. This, on being brought home in daily or weekly portions, is cut up somewhat by hand, the stems and very woody portions being thrown away, and the remainder crushed for use. A mallet and block is the simplest apparatus for the purpose. The Gorse being laid on the block, is first cut to bits with the one end of the mallet, armed with crossed knife edges, and then smashed with the other end, before being given to cows or horses. But many more efficient and less laborious methods exist, in which this manual operation is replaced by a mechanical contrivance.

LAND DRAINAGE COMPANY: *Correspondent.* See advertisement.

SAINFOIN: *T P.* We have grown it on sandy soils, but not with great success. It prefers a limestone or chalky subsoil.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2*s.* 6*d.* each.

Each may be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

NEW PEA.

W. J. EPPS, SEED MERCHANT and GROWER, Maidstone, has much pleasure in offering the following Pea, feeling assured it will give the highest satisfaction.

LORD RAGLAN, OR IMPROVED MAMMOTH.

This Pea was selected from Hair's dwarf Mammoth two years since, and is unquestionably the best and finest in cultivation, and will prove to be the standard Pea of the day. It is a dwarf green wrinkled marrow of very large size, and an immense cropper. Habit dwarf, branching 3 to 4 feet high, producing immense clusters of large bright green pods from the base of the haulm to the top, and similar in shape to the Scimitar, but of greater size, well filled with seven to ten Peas, which are larger than the British Queen, and equal, if not superior in its flavour.

Price, 5*s.* per Quart. Wholesale Prices to be had on application.

Agent: Messrs. HURST and M'MULLEN, Seed Merchants, Leadenhall Street, London.

NEW CUCUMBER.

BURNETT'S PERFECTION.—At the express wish of many cultivators, W. B. is induced to offer the above Cucumber to the public. The following Prizes were awarded to it during the past season:—First Prize at the great Horticultural and Agricultural Exhibition held at Ripon; First and Second at York; also at Scarborough and Driffield there was not a Cucumber shown that could compete with the above. It has been pronounced by several gardeners to be the most perfect Cucumber ever raised. Some of the fruit exhibited as above were cut 10 or 12 days previous to the day of exhibition.

W. B. also recommends TULLY'S GOLDEN QUEEN MELON, as the highest flavoured Melon known. A Medal was awarded to it at Chiswick. W. B. having grown no other variety for the last three years, can supply it true. The Cucumber, in packets, four seeds, 2*s.* 6*d.*, or two seeds, 1*s.* 6*d.*; the Melon, 12 seeds, 1*s.*, in penny postage stamps.

WILLIAM BURNETT, Monk Gate, York.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON, having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high,	and 8 feet in circumference...	63*s.*	0*d.*	each.
8 "	and 4 to 5 feet " ...	21	0	"
7 to 8 "	and 4 feet " ...	15	0	"
6 to 7 "	and 3 to 4 feet " ...	10	6	"
6 "	and 3 feet " ...	7	6	"

Handsome smaller specimens at proportionately lower prices.
Kingston, Surrey.

BECK'S NEW AND BEAUTIFUL SEEDLING PELARGONIUMS.

J. DOBSON AND SON'S CATALOGUE OF PELARGONIUMS, containing full descriptions of the following unequalled varieties, may be had on application:—

*Conqueror	42*s.* 0*d.*	Silenus	31*s.* 6*d.*
*Lydia	21 0	Dido	21 0
*Laura	31 6	Gem of the West ...	31 6
Fidelia...	31 6	Commander in Chief ...	21 0

Those marked * were figured in the "Florist" for September last. Coloured plates may be had in exchange for 14 postage stamps.

Fine show varieties, all the best out, from 12*s.* per dozen. Fancies, from 12*s.* per dozen.

J. D. & SON beg to state that they are enabled to send out extra strong plants of the above, as they are under their own immediate management, and particular attention is paid to this class of plants.

J. DOBSON'S Practical Observations on the Cultivation of the Pelargonium may be had in exchange for 8 postage stamps.

Woodlands Nursery, Isleworth.

GODFREY'S BLACK SPINE.

SPLENDID AND PROLIFIC FRAME CUCUMBER.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom; average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2*s.* 6*d.*; 6 ditto, 1*s.* 6*d.*

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1*s.* each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, January 6.

R. PARKER begs to offer the following CHOICE SEEDS, all of which are warranted new and true to name:

GODFREY'S (BLACK SPINE) CUCUMBER, the finest variety in cultivation, packets containing 12 seeds 1*s.* 6*d.*

Also the following esteemed varieties of CUCUMBERS and MELONS, in packets containing 12 seeds, at 1*s.* each:—

CUCUMBERS.	MELONS.
Henderson's Black Spine.	Victory of Bath.
Improved Patrick.	Beechwood.
Walker's Long Rambler.	Bromham Hall.
Manchester Prize.	Canteloupe.
Hunter's Prolific.	Duke of Bedford.
Superlative Improved.	Golden Perfection (extra fine).
Cuthill's Black Spine.	Scarlet Flesh (Anderson's).

Ohio Squasha Custard Gourd, 6*d.* ... ... per packet.
Antirrhinum, from named flowers, 6*d.* ... "
Calceolaria, from fine varieties, 1*s.* 6*d* and 2*s.* 6*d.* "
Hollyhock, from fine named varieties, 1*s.* 6*d.* and 2*s.* 6*d.* "
Lilium giganteum, the most distinct and noble species of the genus, packets containing 20 seeds, 2*s.* 6*d.*

*** A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5*s.*; 12 varieties, 2*s* 6*d.*; and from good double sorts, 1*s.*

Very superior Quilled German Asters, 12 distinct varieties, separate, 2*s.*, mixed 1*s.* per packet. Also Choice French Asters, 12 varieties, separate, 3*s.*, mixed, 1*s.* 6*d.* Fine Quilled African Marigolds, lemon and orange, 6*d.* per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6*s.* per dozen, or 2*l.* per 100. Double French White, 4*s.* per dozen, or 30*s.* per 100.

Saffron Walden Nursery, January 6.

GARAWAY, MAYES, AND CO., having a large Stock of LILIUM GIGANTEUM Seed, can supply fine picked seed at 10*s.* 6*d.* per 100.

G. M. and Co. can supply DIOSCOREA BATATAS at the advertised prices. Early application is requested, as the stock is limited.

Catalogues of Kitchen Garden, Flowers, and Agricultural Seeds may be had on application. Prices if desired. For prices of Cucumber and Melon Seeds see Advertisement of Dec. 30, 1854.

Durdham Down Nurseries, Bristol, Jan. 6.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s.* per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s.* per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s.* per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

J. AND J. FRASER have to offer a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application.

In offering these Pears, grafted on the Quince stock, we would wish particularly to call attention to their many excellent qualities. They are very compact in growth, and most prolific in bearing, fruiting profusely while the trees are small; thus forming a great acquisition for a small garden. Planted by the side of walks, in addition to their utility, they add much to the neatness and beauty of a kitchen garden. Indeed too much can scarcely be said in favour of these miniature Pear trees; as a proof of their merit the demand for them is yearly increasing.

Strong Trees, showing Fruit Buds, 2*s.* 6*d.* to 3*s.* 6*d.* each.

Lea Bridge Road, Essex, January 6.

CARTER'S PROLIFIC RASPBERRY.—In consequence of J. CARTER seeing his Raspberry quoted in a Nurseryman's Catalogue, who J. C. has reasons for knowing does not possess the true variety, and wishing to prevent imposition, begs to announce that the undermentioned are the only Nurserymen who have been supplied by J. C., or his agents, Messrs. Hurst & M'Mullen. Should other Nurserymen favour with their orders their names will be added to the list; the stock is very limited. Price may be had on application to Messrs. VEITCH & SON, Exeter; RENDLE & Co., Plymouth; WOOD & SON, Maresfield; LOW & Co., Clapton; RIVERS, Sawbridgeworth; PALMER, Annan; TURNER, Slough; APPLEBY, York; DOWLING, Southampton; A. SMITH, Sydnope; FISHER & HOLMES, Sheffield; GEORGE GLENNY, Fulham; URQUHART & SON, Dundee; T. BUNYARD, Maidstone; HURST & M'MULLEN, London; or

JOHN CARTER, JUN., NURSERYMAN, Keighley.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

BLOSSOM OF FRUIT TREES. — WORSTED NET to effectually protect the blossom of wall fruit trees from frost and blight, and the ripe fruit afterwards from wasps and flies, 7*d.* per square yard, in various widths. All kinds of garden, fishing, and sheep nets, made by machinery, and at very low prices.—R. RICHARDSON, 21, Tonbridge Place, New Road, King's Cross, London.

SEASONABLE PRESENTS.—The most appropriate offerings for this season of festivity are those which tend to the promotion of health and personal attraction: none can be more acceptable than ROWLANDS' MACASSAR OIL, for imparting a transcendent lustre to the hair, and sustaining it in decorative charm. ROWLANDS' KALYDOR imparts a radiant bloom to the cheek, and a delicacy and softness to the hands, arms, and neck; and ROWLANDS' ODONTO, OR PEARL DENTIFRICE, bestows on the teeth a pearl-like whiteness, and renders the breath sweet and pure. The patronage of royalty throughout Europe, their general use by rank and fashion, and the universally-known efficacy of these articles give them a celebrity unparalleled.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.—Beware of spurious imitations.

WANTED to Rent, from Lady Day, a SMALL FARM near London, from 40 to 80 Acres, chiefly Pasture, with a good House upon it and the requisite Outbuildings; and not more than 16 miles from town.—Apply, by letter, to the Editor of the *Agricultural Gazette*, 5, Upper Wellington Street, Strand, London.

SPADE HUSBANDRY.

WANTED, from 30 to 60 acres of good sound LAND, for cultivation as a Garden Farm, with ample convenience for House-feeding Stock; also a VILLA or comfortable Farmhouse. References as to position, eligibility, &c. — Address Mr. H., Post-office, Farnham, Surrey.

WHITE PERUVIAN MUSK DUCKS. — A few surplus Birds on hand of last year's broods, from the Advertiser's imported stock, of this very beautiful and valuable kind. Price 10*s.* each; very large exhibition birds, 1 guinea each.

The Peruvian Ducks lay very large eggs during nine months of the year—are excellent for the table—grow to a large size, and both for ornament and profit are a desirable variety.—For particulars address C. W. D., Post-office, Crediton, Devon.

COCHIN CHINA FOWLS.

MR. J. C. STEVENS begs to notify that he has received instructions from Thomas Sturgeon, Esq., of Grays, to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 23d January, at 12 o'clock precisely, a selection of COCHIN CHINA FOWLS consisting entirely of first-class birds. *** This is the only old and known strain of Buffs now in the hands of the original breeder. Mr. Sturgeon has bred them with rare care and judgment for many years, no second-rate bird has been bred from, and they are unrivalled in their combination of form, size, and colour. Up to 1852 they were the winners of all the best prizes at Birmingham, Cheltenham, Winchester, &c., and were never beaten until within the last few weeks; they have since been shown and taken the Silver Vase and 1st Prize at Manchester.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

HETLEY AND CO. are supplying 16-oz. Sheet Glass of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

8 " 6 " 8½ " 6½	...	...	...	13 6 "
9 " 7 " 9½ " 7½ and 10 by 8			...	15 0 "

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2s. each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate Glass never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

NEWLY IMPROVED ECONOMIC STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.

Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 25s. each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.

JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, a few doors east of the Pantheon.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge. ESTABLISHED A.D. 1700.

FURNISH YOUR HOUSE WITH THE BEST ARTICLES AT DEANE'S IRONMONGERY AND FURNISHING WAREHOUSES. Established A.D. 1700. A Priced Furnishing List, free by post.—DEANE, DRAY & Co. (Opening to the Monument,) London Bridge.

FORD'S EUREKA COLOURED SHIRTING is now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27s.

FORD'S WHITE EUREKAS, best quality, Six for 40s.; second quality, Six for 31s.; if washed ready for use, 2s. extra.

CAUTION.—Ford's Eureka Shirts are stamped, "38, POULTRY, LONDON," without which none are genuine.

*** Catalogues with particulars post free.

RICHARD FORD, 38, Poultry, London.

NEW WINTER SOAP.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6d. each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H R H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

WINTER GREEN.—This exquisite Perfume is distilled from Winter Green (Trientalis), cultivated in the Valley of Skardsheidi, in Iceland.—Imported only by H. BREIDENBACH, Wholesale Perfumer, 157B, New Bond Street, London.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1l.—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1l. Hermetically-sealed Inodorous Chamber Commodes, 1l., 2l. 4s., and 3l.; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square, London.

HOT-AIR, GAS, VESTA, JOYCE'S STOVES.—STOVES for the economical and safe heating of halls, shops, warehouses, passages, basements, and the like, being at this season demanded, WILLIAM S. BURTON invites attention to his unrivalled assortment, adapted (one or the other) to every conceivable requirement, at prices from 10s. to 30 guineas. His variety of register and other stoves is the largest in existence.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

	Fiddle Pattern.	Thread or Brunswick Pattern.	King's Pattern.

IMPROVED PATENT ROUGH PLATE, PLAIN, FLUTED, AND IN QUARRY PATTERNS.

British Plate, Patent Plate, Sheet, Crown, and Coloured Window Glass. Pure White Shades for Ornaments. Pumps, Water Closets, and Plumbers' Brass Work. Genuine White Lead, Paint, Colours, Varnishes, Brushes, &c. Tariffs of the above on application to

T. MILLINGTON, 87, Bishopsgate Street Without, London.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.

COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, as one Fixture, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest.

COTTAM'S ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.

IMPROVED PUMPS,

OF THE BEST WORKMANSHIP AND WARRANTED.

The VALVES and SUCKERS of these Pumps are constructed upon an entirely new and SIMPLE principle: they are not likely to get out of order; should they do so, can easily be repaired, as the Pump is so contrived that the valves can readily be got at.

An Improved CAST IRON TRAP, strongly recommended by the Sanitary Commissioners, and suitable for Sugar Bakers, Slaughter Houses, &c. &c. It is so formed that the Trap-plate will pass any matter the top grating will let through, and therefore is not liable to stoppages; and well adapted to Stables and Stable-yards, for saving the best part of Liquid Manure.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

White Mustard.
Bishop's Last and Best Pea.

And many other agricultural Seeds.

NATURAL GRASS SEEDS FOR PERMANENT PASTURES.

SEPARATE OR MIXED EXPRESSLY TO SUIT THE SOIL.

Messrs. SUTTON & SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of the Grasses which thrive in the various soils of Great Britain and Ireland, for the purpose of introducing an improved system of laying down land to Permanent Pasture, are thereby enabled to supply the sorts and quantities of Seeds, varied to suit the soil for which they are intended. The cost will vary from 24s. to 30s. per acre, according to the sorts and quantities the soil requires.

FINE LAWN GRASS SEEDS,

FOR MAKING NEW OR IMPROVING OLD LAWNS.

Price 1s. per pound, 2s. 6d. per gallon, or 20s. per bushel. For forming new Lawns 2½ bushels, or 50 lbs., is the quantity required per acre.

FINE GRASS AND CLOVER SEEDS FOR IMPROVING OLD PASTURES.

Quantity required per Acre, 8 lbs. to 12 lbs., price 9d. per lb.

SUTTON'S COLLECTIONS OF KITCHEN GARDEN SEEDS *are composed principally of the foregoing choice kinds, those in fact which have been proved to be most worthy of cultivation. Those who are not acquainted with the best sorts of Garden Seeds, and the proportions of each suitable for a Garden, are confidently recommended to order one of the undermentioned* COMPLETE COLLECTIONS FOR ONE YEAR'S SUPPLY, *with instructions on cultivation.*

SUTTON'S COLLECTIONS OF KITCHEN GARDEN SEEDS.

No. 1.—A COMPLETE COLLECTION OF GARDEN SEEDS, FOR ONE YEAR'S SUPPLY OF A LARGE GARDEN (WITH INSTRUCTIONS)	£3 0 0
No. 2.—A COMPLETE COLLECTION, QUANTITIES REDUCED (SIMILAR SORTS)	2 0 0
No. 3.—A COMPLETE COLLECTION, EQUALLY CHOICE SORTS	1 5 0
No. 4.—A VERY CHOICE ASSORTMENT FOR A SMALL GARDEN	0 15 0

If some kinds of Seeds are already possessed, purchasers are requested to name them, that increased quantities of others may be sent in lieu of them.—A List of the sorts and quantities in these Collections may be had in return for one penny stamp.

SUTTON'S COLLECTIONS OF FLOWER SEEDS.

These may be had in collections of "*Hardy sorts only*," or assorted in "Hardy," "Half-hardy," and "Tender," as preferred.

No. 5.—THE MOST SHOWY 100 SORTS KNOWN, WITH INSTRUCTIONS ON CULTIVATION (Post Free)	£1 1 0
No. 6.—THE MOST SHOWY 50 ditto ditto	0 10 6
No. 7.—THE MOST SHOWY 36 ditto ditto	0 7 6
No. 8.—THE MOST SHOWY 24 ditto ditto	0 5 0

Should the purchaser have any preference for certain kinds, they should be named in giving the order, that we may include them, or should any sorts be already possessed, they should be named that we may omit them.——Also, Natural Grasses for Lawns and Meadows, fine Mangold Wurzel, Turnip, and other Agricultural Seeds.

All packages of the value of 10s. and upwards are delivered free to any Station on the Great Western, and Berks, and Hants Railways, or of not less than 20s. value, the parcel will be sent free to any Station on the following Railways:—South-Western, South-Eastern, Great Western, Oxford, Worcester, and Wolverhampton, Eastern Counties, Oxford and Birmingham, Bristol and Exeter and South Wales; and packages of 40s. value and upwards are delivered free not only by the above named Railways, but also to Edinburgh, Glasgow, Liverpool, and all Stations of the North Western, Great Northern, and Midland Railways.

COUNTY OF GLOUCESTER AND CHELTENHAM ROYAL HORTICULTURAL SOCIETY.—NOTICE.—The May Show of the above Society will take place on WEDNESDAY, May 2nd, instead of May 9th, as previously advertised. HENRY J. COCHRANE, Secretary.
11, Colonnade, Cheltenham.—Jan. 13.

GARDENERS' BENEVOLENT INSTITUTION. SEVENTH APPLICATION.
HENRY SCHNEIDER, of Ford, Colerne, Chippenham, through his Advertisement, again appeals to the sympathy and kind support of the Subscribers of this Institution, being now 90 years of age, and in very destitute circumstances. His testimonials remain unimpaired, and he is encouraged to make another application to his kind friends who have hitherto favoured him with their votes, and other subscribers who will charitably lend him their aid at the forthcoming election in January next.
The following gentlemen will be gratified in receiving proxies in his favour:—Mr. Gregory, Cirencester, Gloucestershire; Mr. Burbank, Grittleton, Chippenham, Wilts; Mr. Spencer, Bowood, Calne, Wilts; Messrs. Garraway, Mayes, & Co., Bristol; Mr. Trotter, Badminton, Chippenham, Wilts; Messrs. Arthur Henderson & Co., Pine Apple Place, and John Arthur Henderson, Esq., 64, Hamilton Terrace, London.

EVERGREENS.
WANTED, a few Thousand of strong, healthy, bushy LAURELS, from 3 to 4 feet. State lowest cash price delivered free at the Harrow Station, on the North-Western Railway, to Mr. RICHARD FIELD, Surveyor, 34, Coleman Street, City, London.

WANTED, 10,000 or 15,000 transplanted ENGLISH OAKS, well grown stiff plants, well rooted. Also three or four dozen good 2-years dwarf-trained MOOR PARK APRICOTS.—Apply, stating price, &c., to F. & A. DICKSON & SONS, Upton Nurseries, near Chester.

WANTED TO PURCHASE, 2000 or 3000 SEEDLING CRAB STOCKS.—Particulars as to age, price, &c., to be addressed to Warren's Gardens, Isleworth, Middlesex.

LIQUID AMBER.
WANTED TO PURCHASE, 300 of the above.—Send cash price to Mr. JEYES, Nurseryman, Northampton.

TO BE SOLD, very reasonable, 10,000 or more GOOSEBERRY AND CURRANT TREES, strong plants; also a great variety of ORNAMENTAL FOREST TREES, from 8 to 12 feet high; LAURELS, Bushy LAURESTINES, &c.—Apply to Mr. C. CLARK, 179, Windmill Street, Gravesend, Kent.

TO BE SOLD, CHERRIES FOR FORCING; choice from 100 Half Standard and Dwarf May Duke Cherries, from 7 to 12 years old, and ranging from 5 to 10 feet in height; showing abundance of fruit, and acknowledged to be as handsome a lot of trees as were ever offered for sale. Price moderate. To be seen at Mr. MITTON's, Lampton, one mile from either the Isleworth or Hounslow stations of the South Western Railway.

MANGOLD WURZEL SEED.
TO BE SOLD, LONG RED and YELLOW GLOBE, growth of 1854, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

TO THE TRADE.
J. ROY, Jun., SEEDSMAN, Aberdeen, has got to hand a consignment of 35 bales of very superior CUBA BAST. The bales weigh about 1½ cwt. each. Price forwarded on application.

SEED WHEAT.—Samples and Prices of RED HYBRID, NURSERY, and other kinds of Wheat from the CHALK, sent on application to Mr. H. RAYNBIRD, Basingstoke. The Red Hybrid and Nursery are well suited for late sowing after Turnips.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM BARRATT, Wakefield.
☞ A quantity of fine Transplanted White Thorns.

SEEDLING FOREST TREES AND SHRUBS.
DAVID REID AND SON, NURSERYMEN and FLORISTS, Leith Walk, Edinburgh, beg to direct the attention of the trade to their Stock of Seedlings as above.
Catalogues free on application.

CHOICE CALCEOLARIAS.
J. COLE begs to offer a few dozen of his unblooned Seedling HERBACEOUS CALCEOLARIAS from his choice stock; they were the admiration of all who saw them last summer. They are not potted off, though strong enough for large 60-sized pots. The Seed was saved from selected stock, carefully impregnated. J. C. offers them at 4*s*. per dozen, or 25*s*. per hundred. A remittance solicited from unknown correspondents.—Keyfield Nursery, St. Alban's, Herts.

SUTTON'S SHORT SEED LIST.—ON THE LAST PAGE *of* LAST WEEK'S "CHRONICLE" *will be seen a concise List of the leading kinds of Seeds, which it is hoped will be found convenient to Gentlemen writing out their Seed orders.*
Early commands will have the preference of scarce sorts.
SUTTON & SONS, Seed Growers, Reading.

HOLCUS SACCHARATUS, OR CHINESE SUGAR CANE.
SUTTON AND SONS *can supply this Seed genuine as imported in sealed packets at* 1*s*. *or* 2*s*. 6*d*. *each. Post Free.*
For description and uses, see *Gardeners' Chronicle*, Dec. 30th, 1854, p. 835.—SUTTON & SONS, Seed Growers, Reading.

TO THE SEED TRADE.
WILLIAM E. RENDLE, SEED MERCHANTS, Plymouth, *have to offer some very Choice Stocks of* SEEDS *to the Trade. Wholesale Catalogues can be had on application to*
WILLIAM E. RENDLE & Co., Union Road, Plymouth.

WHITE BELGIAN CARROT, MANGOLD WURZEL, &c.—*Several Tons to be disposed of at the lowest market prices.—Apply to*
WILLIAM E. RENDLE & CO., SEED MERCHANTS, Plymouth.

NEW SEEDS JUST HARVESTED *can now be obtained of the most genuine description, from*
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

DIOSCOREA BATATAS—THE NEW CHINESE POTATO.—This new esculent was fully described by Professor Lindley in the *Chronicle* of December 23, 1854.
The Subscribers are now importing a choice lot of Roots, and can supply them on the following terms:—

Four Tubers	£0 10 0	Fifty Tubers	£5 5 0
Ten „	1 2 6	Hundred „	10 0 0

First Orders will have the best Roots.—Apply to
WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

DIOSCOREA (JAPONICA) BATATAS.
SUTTON AND SONS respectfully intimate that they have sold out of their first importation of Dioscorea Tubers. They are daily expecting the arrival of a further supply, but a considerable portion of these being already bespoke, orders can now only be received conditionally.
SUTTON & SONS, Seed Growers, Reading.

SEED POTATOES.
THE IMPORTANCE OF CULTIVATING THOSE SORTS OF POTATOES which, from their vigorous habit of growth and early maturity, are least subject to disease, has induced us for several years (ever since the first general development of the disease), to make many experiments as to the sorts most desirable, and the cultivation most suitable. Our New Seed List contains the names and prices of the principal kinds.—Address, JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

CHARLES SHARPE AND CO.'S Wholesale Catalogue of Seeds is now ready, and may be had on application.
DIOSCOREA (JAPONICA) BATATAS, NEW CHINESE POTATO.—A choice lot of imported roots of the above. Price to the trade on application.
Nursery and Seed Establishment, Sleaford.

CHARLES SHARPE AND CO. beg to draw the attention of the nobility, gentry, and clergy to their superior collection of Seed Potatoes, which they can recommend as decidedly the best in cultivation. Price per bushel, of 4 stones:—

Early Ash-leaved Kidney	9*s*.	Early Emperor	9*s*.
„ do. do. Jackson's	9*s*.	„ Cockney	9*s*.
„ Round Frame ...	9*s*.	„ Oxford	9*s*.
„ Martin's Globe ...	9*s*.	„ White Rough ...	8*s*.
„ King's	8*s*.	„ Foxe's Seedling ...	9*s*.
„ Hen's Nest... ...	10*s*.	„ American Native ...	8*s*.

FOR LATE PLANTING:—
Yorkshire Regent, 7*s*. | Prince Regent, 7*s*. | Fluke Kidney, 8*s*.

DIOSCOREA (JAPONICA) BATATAS, NEW CHINESE POTATO.—This was described in the *Gardeners' Chronicle* of December 23, which see for mode of cultivation, &c. Price, per root, 2*s*. 6*d*.; per dozen, 24*s*.
Nursery and Seed Establishment, Sleaford.

"EXTRAORDINARY POTATOES.—A variety of Potatoes, singled out from some grown three or four years ago, has this year produced on the land of the Thingoe Union house about 31 sacks, of which only 3 pecks are bad or small, and 60 Potatoes measure a bushel, weighing 60 lbs. Two have been brought to us, weighing together 3 lbs. 2 oz.; it is an excellent mealy Potato, and an abundant bearer."—*Bury Post*, October 11, 1854.
The above Mammoth variety have been christened the "Lord Raglan," and there are a few sacks of the medium size to dispose of, price 2*l*. 2*s*. per sack; also Jackson's Improved Early Ashleaf. price 9*s*. per bushel; the Short-top Ashleaf, 7*s*. 6*d*.; British Queen, 7*s*. 6*d*.; and Nonpareil Kidneys, 6*s*. 6*d*. Free to London, and no charge for sacks; all orders must be accompanied with a remittance.—JOSEPH WILSON, Seedsman, Ipswich.

REGENT POTATOES, of the finest size and flavour, direct from the grower to the consumer's door, free within three miles of King's Cross, at 14*s*. 6*d*. the imperial sack of 224 lbs., for cash, from C. FLITTON, factor, 21, York Road, King's Cross.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.
To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

GREAT NOVELTIES FOR THE ENSUING SEASON,
FUCHSIAS WITH WHITE COROLLAS.
LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—
FLORENCE NIGHTINGALE.
Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.
CALANTHIFLORA-PLENA
(The DOUBLE Snowdrop Corolla'd Fuchsia.)
Pure double white corolla, resembling a fine large double snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10*s*. 6*d*. each.
The usual discount to the Trade when three or more are taken.
Exeter Nursery, Exeter.—ESTABLISHED 1720.

EARLY DANIEL O'ROURKE PEAS.
J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

FAIRHEAD'S EARLY CONQUEROR PEAS, the earliest variety known, 1*s*. per quart. Price per bushel or quarter, on application to CLARKE & Co., Seedsmen, Borough.

EARLY WHITE FIELD PEA.—NEW EARLY RACEHORSE—comes off early in July in time for Turnips and is a good cropper, price 12*s*. per bushel.
SUTTON & SONS, Seed Growers, Reading.

NEW CAULIFLOWER.
WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s*. per lb.; smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.
J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).
CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s*. per doz.; HOWARD'S PRINCE ALBERT, 12*s*. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford. Jan. 13.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

VEGETABLE AND FLOWER SEEDS.
PETER LAWSON AND SON beg leave to intimate to their English customers and the public that they are prepared to supply from their London establishment assortments of GARDEN and FLOWER SEEDS of superior quality, comprising all the esteemed standard sorts and those recently introduced. They will be happy to send Catalogues on application.
P. L. & SON have also to intimate that they will shortly issue their LIST of AGRICULTURAL SEEDS, all of which have been carefully saved from the most select stocks.
Liberal arrangements will be made for the carriage of their seeds to all quarters.
PETER LAWSON AND SON,
Queen's Seedsmen, Wood Foresters, &c., for Scotland, and to the Highland and Agricultural Society, 27, Great George Street, Westminster, London.

PRICED NURSERY CATALOGUES.
A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their Stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out.
Their Seeds may be fully relied on as being in every respect of first-rate quality, and true to their sorts. Catalogues may be had on application.—Pine Apple Place, Edgware Road, London.

GERMAN FLOWER SEEDS.
MOSCHKOWITZ AND SIEGLING, Erfurt, beg to inform the trade that their new Wholesale Catalogue of Choice German and other Flower Seeds, is now ready, and may be had on application to their Agent, Mr. H. HENKEL, 70, Fenchurch Street, London.

W. DRUMMOND AND SONS' NEW DESCRIPTIVE CATALOGUE, containing select varieties only, of VEGETABLE and FLOWER SEEDS is now ready, and may be had post free on receipt of one postage stamp. This Catalogue will, at a glance, furnish the Gardener with all the necessary material for drawing out his Seed List correctly and without trouble. In reference to it the *Gardeners' Chronicle* remarks:—
"It is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon for the sake of both buyer and seller;" and this opinion has been cordially responded to by all our old and many new customers.
W. DRUMMOND & SONS' Seed and Implement Warehouse, Stirling.

TWO NEW CUCUMBERS.

SIR COLIN CAMPBELL AND GENERAL CANROBERT.

THE ABOVE are two of the Finest and most Superb New Hybrid Cucumbers ever yet sent out for Exhibition, Winter Cultivation, and every other purpose for which a Cucumber is required.

SIR COLIN CAMPBELL CUCUMBER.

The above Cut is an exact representation of one of the fruit grown this summer, which measured exactly ten of its diameter long, being 25 inches, with not more than half an inch handle. It is a splendid Black spine, of a dark green colour, and free from ribs or shoulders; grows very quick, sets free, and carries its bloom well. As a Cucumber for Exhibition nothing can surpass it, and is very prolific, often throwing out four or five fruit from every joint, and the vines are short jointed. The fruit is solid, and eats very crisp, and for market it keeps its bloom well for many days, not turning colour at the stem or point as most varieties do. Fruit was cut from the above in January last, and the same plants continued to produce fine fruit until the end of October.

GENERAL CANROBERT CUCUMBER.

This is also a most superb variety for winter cultivation, for which it is best adapted, being a hybrid from Lord Kenyon's Favourite and Phenomena. It has a great advantage over Kenyon's in length, growing to about 18 inches in the same time in which Kenyon's will grow 12 inches; it is equally as hardy and productive. Of a dark green appearance, Black Spine, and a free setter; fruits freely during the whole of the winter, and always grows a very even size from stem to point. It will swell off two or three fruit at a time on a plant, during the depth of winter, and carry them out well, which it does with less heat than any other: this has been proved when several varieties have been grown together, this having the coldest part of the house. The object of the raiser of the above superb varieties has been to obtain perfection and hardiness, in which he has succeeded, by continually hybridising different varieties.

Sold in Packets of Five Seeds, 3s. 6d. each, or 1 Packet of Sir Colin Campbell and General Canrobert for 6s.

The following fine varieties of Cucumbers and Melons, which have been thoroughly proved and have given the greatest satisfaction to all Purchasers, can be supplied.

CUCUMBERS.				MELONS.			
Captivation ...	... 2s. 6d.	Hunter's Prolific	... 1s. 0d.	The Queen ...	... 1s. 0d.	Beechwood ...	... 1s. 0d.
Phenomena ...	... 2 6	Mills' Jewess ...	... 1 0	Bromham Hall ...	... 1 0	Windsor Prize ...	... 1 0
Lord Kenyon's ...	... 2 6	Cheltenham Surprise	... 1 0	Incomparable ...	... 1 0	Emperor	... 1 0
Essex Hero ...	... 2 0	Manchester Prize	... 1 0	Golden Ball ...	... 1 0	Fleming's Hybd. Persian	1 0
Victory of Bath ...	... 1 0	Mon House True	... 1 0	Bowood	... 1 0	Blackall's Green Flesh	1 0
Gordon's White Spine	... 1 0	Cuthill's Black Spine	... 1 0	Victory of Bath...	... 1 0	Bailey's "	1 0
Sunderland Wick	... 1 0	Conqueror of the West	... 1 0	Camerton Court	... 1 0	Snow's Hybrid ...	... 1 0

A Packet of either of the Melons will be given to all Purchasers of the two new Cucumbers advertised above.

A Remittance must accompany every Order by Cash or Penny Postage Stamps, and the whole, or any part (as the case may be), will be immediately forwarded.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST,
14, Abbey Church Yard, Bath, Somersetshire.

The New Chinese Potato, Dioscorea (Japonica) Batatas.

MR. JOHN HENDERSON,

Formerly of the Firm of JOHN A. HENDERSON & Co., Pine Apple Place, London,

HAS the pleasure of informing the Public that he has just completed the Purchase from M. PAILLET, of Paris, of his entire Saleable STOCK of the above introduction from China, the nutritive properties of which are said so far to surpass the ordinary Potato that it is likely, not only to act as an auxiliary, but entirely to SUPERSEDE that valuable but uncertain esculent.

The most satisfactory results have followed from personal experiments, and proved that when cooked in the ordinary manner, from the large amount of FARINACEOUS properties it contains, it can NEVER become waxy, as is too generally the case with the Potato. Its FLAVOUR resembles in delicacy an early ASH-LEAVED KIDNEY; but, independent of the above excellent qualities, there is every probability of its taking a still more important position in the ECONOMY of this country, for, when dried and reduced to powder, it is equal to the best ARROW-ROOT; or mixed in the proportion of one-third with two-thirds of wheaten flour, it makes an extremely light and wholesome BREAD, as well as very superior PASTRY.

Messrs. VILMORIN & Co., speaking of it, observe: "Of all the esculent roots proposed as substitutes for the diseased Potato, the DIOSCOREA JAPONICA is certainly the only important one. It is easily propagated. The tubers are large and long, the flesh very mealy and devoid of any peculiar or disagreeable flavour. The DIOSCOREA JAPONICA is, in our opinion, a PRECIOUS ACQUISITION."

M. PELÉ, Horticulturist, Paris, in his Supplementary Catalogue of this autumn says:—"A new alimentary root, introduced into France by M. MONTIGNY, French Consul in China. Various experiments have shown that this tuber will be much more advantageous to cultivate than the Potato, both in regard to its QUALITY as well as PRODUCE."

M. PAILLET, to whom the Imperial Society of Agriculture and Commerce of France has awarded the sum of 3000 francs as encouragement for having brought it into cultivation, also notices that "this tuber attains at least 1 to 2 lbs. weight. In its growth it is less delicate than the Potato, which unfortunately has of late years much degenerated. It does not require particular care, and its abundant produce amply repays cultivation. Its taste is pleasant, and being a root which contains a large amount of FARINA, will be a great addition to the FOOD OF THE PEOPLE as soon as it becomes generally known. It is so HARDY that it has passed the winters of 1853–4 in the open ground, without having in the least suffered from frost. It is also found that the STEMS and LEAVES, which are very numerous, form an EXCELLENT FOOD FOR CATTLE."

Tubers, with description of the Chinese Mode of Culture, to be obtained of MR. JOHN HENDERSON, KINGSKERSWELL, SOUTH DEVON, at the following prices, for cash only:—

4 Tubers ... ... £0 10 0 | 10 do. ... ... £1 2 6 | 50 do. ... ... £5 5 0 | 100 do. £10 0 0

Post-office orders are requested to be made payable at Newton Abbot, South Devon. The usual discount allowed to the trade when not less than 50 are taken.—P.S. All orders unaccompanied by a remittance will be considered as not received.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets, are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 23, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

NEW SORTS OF PEAS.

CARRIAGE FREE, EXCEPT PARCELS UNDER 10s. VALUE.

SUTTON AND SONS *have much confidence in recommending the undermentioned* PEAS, *as being not only new and distinct from others, but also as possessing superior properties.*

Prices per peck or bushel may be had on application.

	s.	d.
PRIZETAKER.—New, fine long green pods, which hang so closely as almost to cover the haulm from top to bottom. Numerous prizes were awarded to the Prizetaker last summer. This is the first season we have offered it for sale. Height 5 feet	2	6
BECK'S EARLY GEM.—New, prolific, and fine flavour; particularly adapted for narrow borders and for small gardens. Height 1½ foot	1	6
BECK'S ECLIPSE.—Similar to Scimetar, but earlier and more dwarf. Height 2 feet	1	6
SUTTON'S EARLY CHAMPION.—One of the forwardest sorts known, good flavoured, and prolific. This Pea is worth a much higher price, but having grown a large crop, we are enabled to offer it very moderate; 3 feet	1	0
WAITE'S DANIEL O'ROURKE.—A very popular variety, considered by some to be the forwardest Pea yet out. It should be tried against our Early Champion; 3 ft. high	2	0
FAIRHEAD'S EARLY CONQUEROR.—Height 3 feet	1	0
PAUL'S EARLY DWARF.—One of the most prolific early Peas, forming a complete mass of blossoms and pods. Height 2 feet	2	0
FAIRBEARD'S NONPAREIL.—New wrinkled marrowfat, very sweet, juicy, and prolific; 9 or 10 will be found in every pod, and the pods extremely numerous; 4 ft. high	2	0
WAITE'S KING OF MARROWS.—As large as British Queen, with fine green pods, very long and full; 6 ft. high	2	6
HAIR'S DEFIANCE.—Like Knight's tall, but earlier and not so tall; 5 feet high	1	6
HAMILTON'S NOVEMBER PROLIFIC.—Excellent for all seasons; 3 feet high	1	6
NE PLUS ULTRA.—One of the finest green wrinkled; 6 ft.	1	6

SUTTON & SONS have a large stock of good old kinds at low prices, as see their Priced List, just published, price 6d., or gratis to purchasers.

SUTTON & SONS, Seed Growers, Reading.

R. PARKER begs to offer the following CHOICE SEEDS, all of which are warranted new and true to name:

GODFREY'S (BLACK SPINE) CUCUMBER, the finest variety in cultivation, packets containing 12 seeds 1s. 6d.

Also the following esteemed varieties of CUCUMBERS and MELONS, in packets containing 12 seeds, at 1s. each:—

CUCUMBERS.	MELONS.
Henderson's Black Spine.	Victory of Bath.
Improved Patrick.	Beechwood.
Walker's Long Rambler.	Bromham Hall.
Manchester Prize.	Canteloupe.
Hunter's Prolific.	Duke of Bedford.
Superlative Improved.	Golden Perfection (extra fine).
Cuthill's Black Spine.	Scarlet Flesh (Anderson's).

Ohio Squasha Custard Gourd, 6d. ... ... per packet.
Antirrhinum, from named flowers, 6d. ... "
Calceolaria, from fine varieties, 1s. 6d. and 2s. 6d. "
Hollyhock, from fine named varieties, 1s. 6d. and 2s. 6d. "
Lilium giganteum, the most distinct and noble species of the genus, packets containing 20 seeds, 2s. 6d.

*** A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out in April next their new Seedling FUCHSIAS with White Corollas, both double and single, some striped or variegated Corolla'd Fuchsias, and a Fuchsia with a Purple Corolla. The latter Fuchsia (Prince Albert) was purchased of E. Banks, Esq., after having proved the flower as possessing unquestionable merits. All the other varieties were purchased of W. Story, Esq., of Newton, in the county of Devon, who succeeded in introducing a Scarlet Fuchsia with White Corolla, which new feature in this tribe gives one of the greatest novelties that they have had the pleasure of seeing for many years. Mr. Story, being the raiser of this new Class, offered them to Messrs. Henderson for 100 guineas, which offer they accepted. A faithful drawing of three of the varieties here offered has been taken by Mr. James Andrews, the well-known floricultural and horticultural artist; sketches from which have appeared in Van Houtte's "Flore des Serres," Verschaffelt's "Illustration Horticole," and will also appear in Turner's "Florist," for February. The dwarf, compact, and free flowering habits of the plants will be sure to please every grower of this tribe.

QUEEN VICTORIA (Story's).—Splendid wide sepals, beautifully reflexed, of a bright scarlet crimson, and a lovely clear white corolla. Price 10s. 6d.

PRINCE ALBERT (Banks's).—Scarlet crimson sepals reflexed, and rich violet corolla. This flower we consider unequalled by any, its reflexing properties being such that either more or less would be a fault; indeed the flower is perfection itself. 10s. 6d.

MRS. STORY (Story's).—Fine large scarlet tube, long wide sepals reflexed; corolla fine substance, and clear white. 10s. 6d.

RANUNCULÆFLORA (Story's).—Scarlet sepals and tube, with double white corolla, a flower not having that confused appearance as many of the double varieties are known to possess. This was considered the best of the only two double white varieties flowered by Mr. Story. 21s. The other double variety we do not appear to have received.

PERUGINO (Story's).—Fine large scarlet sepals and tube, with a conspicuous striped corolla of rose and purple flakes, handsomely reflexed and free flowering. 10s 6d.

EMPRESS EUGENIE (Story's).—Wide reflexed petals of a rosy crimson, the inside of petals having a violet shading; corolla fine white. 10s. 6d.

RAFFAELLE (Story's).—A beautiful variegated corolla with crimson sepals well reflexed, and of good substance; the colour of the corolla is a rich chocolate flaked with rose, free flowering 10s. 6d.

LADY OF THE LAKE (Story's).—Fine deep crimson, with a blush white corolla, very pretty. 10s. 6d.

WATER NYMPH (Story's).—Bright scarlet crimson globe stout wide petal, corolla fine clear white; an elegant flower. 10s. 6d.

Or if the set of nine be taken, the price, 4l. 4s.

January, 1855.

MESSRS. E. G. HENDERSON AND SON were surprised to see an advertisement a few weeks back in the *Gardeners' Chronicle*, from Messrs. Lucombe, Pince, and Co., of Exeter, offering two new Fuchsias, similar in character to those described above, and after a written communication with Mr. Story, it was thought necessary for one of the Firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received SEVEN POUNDS for them after (as the said jobbing gardener stated) he had been offered 20l. for them by a Nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son think the above explanations necessary, in consequence of a great number of their customers having ordered them at higher prices than are quoted above. This reduction is made in consequence of information which they have received, that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co., are similar in character to the above.—Wellington Nursery, St. John's Wood.

ESTABLISHED ABOUT HALF A CENTURY.

BASS AND BROWN'S NEW SEED LIST

IS NOW READY,

AND CONTAINS EVERYTHING WHICH CAN BE DESIRED OF THE CHOICEST, NEW, AND OTHER VEGETABLES.

Considerable attention is paid to grow only the finest sorts for sale, and our Collection is very select.

ASSORTED COLLECTIONS OF VEGETABLE SEEDS.

The following, of the very best in cultivation, cannot fail to give the most complete satisfaction.

No. 1, Collection for a large garden, containing quantities sufficient for one year's supply ... ... £3 0s. 0d.
No. 2, Collection in smaller proportion 2 0 0
No. 3, Collection in smaller proportion... ... ... £1 5s. 0d.
Collection of good kinds for a small garden 0 15 0

A FEW CHOICE NEW VARIETIES OF PEAS.

EPPS'S LORD RAGLAN, or Improved Mammoth, producing 8 to 10 Peas in a pod, and allowed to be the finest in cultivation... ... ... per quart 5s. 0d.
EPPS'S MONARCH, new tall marrow, and the largest sized Pea cultivated ... ... per quart 5 0
FAIRBEARD'S NEW NONPAREIL, a delicious new wrinkled marrow, of great produce and fine pods, a very rapid grower, coming in before the Champion of England 2 6
MEIN'S PARADISE, a most valuable early very large marrow Pea, pods large, long, and well filled, and fine flavour. This Pea, though very large, comes in immediately after the Warwick ... ... per quart 1s. 6d.
HAIR'S DEFIANCE, wrinkled marrow, fine do. 1 9
*** Sangster's No. 1, Daniel O'Rourke, Hair's Dwarf Mammoth, Early Emperor, or Fairbeard's Conqueror, Burbidge's Eclipse, Champion of England, and other best sorts.

The List of FLOWER SEEDS will also be found, as usual, very select. Goods Carriage free (not under 20s.) to all the London Termini, and all Stations on the London and Norwich Colchester Line.

SEED & HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

FRUIT TREES.—SURPLUS STOCK.

WILLIAM JACKSON AND CO., Bedale, Yorkshire, having a portion of their Nursery Ground to clear, beg to offer the following FRUIT TREES of the most useful and approved sorts, strong and well grown, in a bearing state, at annexed cheap rates:—

	Per dozen.—s.	d.
Apples and Pears, good strong Standards	8	0
Do. do. do., Dwarfs	6	0
Do. do. do., Dwarfs, trained	18s. to 24	0
Cherries, good strong Standards	10s. to 12	0
Do. do. do., Dwarfs, trained	24s. to 30	0
Plums, good strong Standards	... 9s. to 10	0
Do. do. do., Dwarfs trained	24s. to 30	0
Apricots, Peaches, and Nectarines, trained	42s. to 48	0

A reference or remittance is respectfully solicited from unknown correspondents.—Jan. 13.

HOLLYHOCKS.

JOHN CHATER AND SON offer the following New and Choice HOLLYHOCKS in Pots at 18s. per dozen, hamper included:—Pourpre de Tyre, Yellow Model, Saffranot, Duke of Rutland (new), Penelope, Swansdown, Gem, Lady Braybrooke, Spectabilis, White Perfection, Black Prince (new), King of Roses, Raphael, Napoleon, Magnum Bonum, &c.

Also the following strong ground Roots, 7s. 6d. per dozen:—Queen, Bella Donna, Elegans, Brilliant, Marmion, Mrs. Russell, Venosa rubra, Obscura, Aurantia, Purpurea elegans, Flower of the Day, Marchioness of Breadalbane, Queen of England, and Model of Perfection.

New Crimson Rockets, 6s. per dozen; Double White do., 3s. per dozen, 20s. per 100.

Hollyhock Seed, in packets containing 200 seeds, 1s. 6d.; 400, 2s. 6d.; warranted from best flowers. Choice Pansy, 1s. per packet. Sweet William, 6d.

Descriptive Catalogues may be had on application to J. CHATER & SON Haverhill, Suffolk.—Post Office Orders payable at Haverhill.

FASTOLFF RASPBERRY.

YOUELL AND CO. are now sending out extra strong canes of the above most excellent RASPBERRY, unequalled by any other variety for the size of its fruit and richness of flavour, at 15s. per 100; Large White Raspberry, 24s. per 100; New Monthly Fruiting ditto, 24s. per 100.

CHOICE FRUITS (WARRANTED TRUE TO NAME.)

APPLES, Standard, in best selection, good heads,			9s.	0d.	per doz.
" Dwarf	ditto	ditto	6	0	"
" Trained	ditto	ditto	30	0	"
PEARS, Standard	ditto	ditto	12	0	"
" Dwarf	ditto	ditto	8	0	"
" Trained	ditto	ditto	30	0	"
PLUMS, Dwarf	ditto	ditto	9	0	"
" Trained	ditto	ditto	36	0	"
PEACHES, Df. trained, in fine strong plants,			36s. to 60	0	"
NECTARINES, Dwarf trained	ditto		36s. to 60	0	"
APRICOTS	ditto	ditto	36s. to 60	0	"
CHERRIES, Standard, in fine variety,	ditto	...	12	0	"
" Dwarf	ditto	ditto ...	9	0	"
" Trained	ditto	ditto	36s. to 42	0	"

GOOSEBERRIES, 25 of the finest varieties (good bushes), selected for size and flavour, 30s. per 100, or 4s. per dozen.

CURRANTS.—Improved large White Dutch, Black Naples, Raby Castle (red), and large Red Grape, 4s. per dozen. These are the most desirable kinds in cultivation, and are highly recommended.

RHUBARB.—Royal Albert, 9s. per doz.; Linnæus, 9s. per doz. Tolosk. 6s. per doz. (strong).

SEAKALE.—Extra strong, 2 years, 6s. per 100; 3 years, 8s. per do.

ASPARAGUS.—Extra strong for forcing, 5s. per 100; 3 years old, 3s 6d.; 2 years old, 2s. 6d.

LILY OF THE VALLEY.—Strong for forcing, 5s. per 100.

All orders of 2l. and upwards are delivered carriage free to London, Hull, and Newcastle-on-Tyne, as well as to any railway station within 150 miles of the Nursery. Communications by steamer and railway to all parts of England, Ireland, and Scotland, as well as the Continent. Post Office orders to be made payable to YOUELL & CO.

YOUELL & CO., Royal Nursery, Great Yarmouth.

NEW SEEDLING POTATO—THE CHAMPION KIDNEY.

This Potato bears a great resemblance to that fine old Potato, the Ashleaf Kidney; it possesses the following good qualities over the Ashleaf. If planted at the same time it will be ten days earlier, all the sets always vegetate well, and do not die off in the ground as the Ashleaf does; 2 pecks of seed will produce a greater weight of Potatoes than 3 pecks of the Ashleaf. It is quite equal to that in flavour, and is eatable during the whole winter. Sets that have had the shoots broken off five or six times during the spring will vegetate again as if it had been the first shoot. About twenty Gentlemen and Gardeners who had seed to plant last season have assured me that they never before grew any Potato to equal it, and should continue to grow it as a first early Potato. Numerous orders have been already received from persons who saw it growing during the last summer. It has been grown and thoroughly proved for the last four years, and found to be less liable to disease than any other Potato that has been grown. Out of 25 sacks grown this season there was not a single diseased Potato among them.

Sold in quantities of not less than 1 peck; they will be sent Hamper and Package free, at 5s. 6d. per peck, or 4 pecks for 1l., hamper free. A remittance in cash must accompany all orders, or small amounts in penny postage stamps. Purchasers would do well to name the nearest railway station to their residence.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST, 14, Abbey Church Yard, Bath, Somerset.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY for 1855 *is now published, price* 6d. *To be had of all Booksellers, and from*

WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth.*

SEEDS FOR THE FARM.

SUTTON'S PRICED LIST will be seen on the last page of last week's *Chronicle*, page 16.

N.B.—*In the List above referred to, two typographical errors occurred, viz., in the prices of* "SUTTON'S *Purple-topped Hybrid Turnip," and "Hardy White Swede." Both of these useful kinds are* 1s. 6d. *per pound.*

Early orders are requested and recommended.

The Gardeners' Chronicle.

SATURDAY, JANUARY 13, 1855.

Since the account of the CHINESE YAM (*Dioscorea Batatas*) which we gave a few weeks since (1854, p. 820), a further report by M. DECAISNE upon the result of last year's experience in France has reached us. It appears from this statement that the root has excited the greatest interest in that country, that it is already regarded as a sufficient recompense for the disasters which attended the Potato disease, and that the public establishments are overwhelmed with applications for it from all parts of the country. The substance of M. DECAISNE's statement is as follows:—

About the middle of April, when he considered the danger from frost to be over, he planted out in the garden of the Museum of Natural History some pieces of the roots. Some were taken from the upper and smaller part of the tubers, others from the thicker part. The first were scarcely as thick as the little finger, and averaged 2¾ inches in length; the others were much larger, and formed slices or cross sections of a cylinder, each 1¼ to 1½ inch thick on the edge. Three tubers weighing from 10½ to 14 ounces were planted whole, in order to compare their produce with that of the cut sets. The plantation was made in an open border on the level, and not on ridges, as ought to have been done, a circumstance, however, which in no way affected the growth of the tubers; it only rendered the taking up difficult. The distance between the plants was 19½ inches every way; this was another mistake, for, according to the judicious observations of M. L. VILMORIN, they should have been much wider apart. The short time which has elapsed since the introduction of the Chinese Yam prevents M. DECAISNE's determining what may be called a good or a bad year for it; the future alone will show under what conditions of climate it best succeeds. All that can at present be said is, that in 1854 the growth of the plants was uniform, that their long twining stems grew vigorously, and were thickly covered with leaves, that abundance of flowers were produced (they were all males) about the beginning of August, and finally that vegetation ceased and the leaves began to acquire a yellowish tint after the middle of September, thus indicating that the tubers had nearly come to maturity.

With the exception of some specimens kept apart for other experiments, all the plants were separated into three distinct lots. Two of these lots were staked—one with strong stakes 10 feet or more in height, the other with stakes 6 or 7 feet high. The stems twined round the stakes very regularly, in the same way as Running Kidney Beans, and soon grew beyond them. In the third lot the plants were left unsupported, and their stems spread over the ground without taking root, twining amongst each other; these did not nearly attain the length of those which were staked. In no case were the plants either earthed up or hoed, operations which did not appear to be required. The tubers were taken up on the 6th of November. The following return shows the results of the different modes of planting and cultivation which were adopted.

A. *Tubers planted entire, weighing on the average* 10½ *oz. each.*—Three tubers produced very vigorous plants, each of which formed one fresh tuber; two of these were enormous and quite out of the common run, one weighing, when taken up, about 3 lbs., the other 2 lbs. 9 oz. The third was attacked by the grub of the cockchaffer, and only yielded pieces; its stems, moreover, withered in August. The tubers which had been planted were shrivelled without being much decayed or changed. Notwithstanding the size of the two new tubers obtained, this mode of planting is considered to be very objectionable.

B. *Plantation made with pieces of the tubers varying in length and thickness.*

* PLANTS WITH STAKES TEN FEET LONG.

This lot consisted of 16 plants, of which one produced two middle-sized tubers, weighing together fully 11½ oz., and which ought to be considered as only forming one. Weighed carefully three days after the tubers were taken up, and when dry and clean the following was the result:

No.	Grammes.	No.	Grammes.
1	095	9	175
2	140	10	350
3	390	11	185
4	540	12	105
5	260	13	95
6	330	14	100
7	390	15	100
8	420	16	30

[Total, 3 kil. 705 grammes, about 8 lbs 2½ oz., or a mean per tuber of 8 oz. $\frac{168}{1000}$.]

** PLANTS WITH STAKES 6 TO 7 FEET HIGH.

The plants, of which there were 28, also produced only one tuber each, of the following weights:—

No.	Grammes.	No.	Grammes.
1	40	15	550
2	50	16	270
3	55	17	380
4	195	18	370
5	690	19	270
6	550	20	265
7	520	21	220
8	790	22	230
9	540	23	225
10	420	24	355
11	420	25	55
12	440	26	165
13	450	27	210
14	765	28	175

[Total, 9 kil. 655 grammes, = 21 lbs. 4½ oz.; or, on the average, 12 oz. $\frac{175}{1000}$ per tuber.]

*** PLANTS NOT STAKED, THEIR STEMS STRAGGLING ON THE GROUND.

The number of plants was 13, and they gave the following results:—

No.	Grammes.	No.	Grammes.
1	488	8	245
2	475	9	150

[Total, 3 kil. 916 grammes, = 8 lbs. 6½ oz., giving an average of 10 oz. $\frac{625}{1000}$ per tuber.]

The sum total of the produce of the three lots planted with pieces of tubers gives 17 kil. 286 grammes, or 38 lbs. 1¾ oz., as the produce of 57 plants, which is at the rate of rather more than 10½ oz. for the average weight of each tuber.

In this calculation the quantity of space on which the plants grew is not taken into account, nor would it have led to any useful inference, because, as has been already stated, the plants were too far apart. But when he takes into consideration the perfectly tap-rooted nature of this plant; the shortness of the slender lateral roots, which are not more than from 3 to 3½ inches long; and moreover the large development of the stem and leaves, which clearly indicates that the plant lives principally on elements dissolved in the atmosphere, M. DECAISNE infers that at the distance of 10, or even 8 inches every way, the plant would have sufficient space for its proper growth. There would thus be from 16 to 25 plants in a square mètre. Taking the 20 plants to produce on an average each 10½ oz. of tubers, we have about 13¼ lbs. per square mètre, or a total of about 23 tons 17 cwt. of tubers per acre. This is double the average weight of Potatoes produced in France on the same space of ground.

So large a produce M. DECAISNE admits to be entirely hypothetical, and calculated for the best conditions

of soil and temperature, in the climate of Paris; it is also made upon the supposition that the whole of the ground is occupied. But although the computation may be too high, and notwithstanding that the Chinese Yam costs more to plant than the Potato, M. DECAISNE has nevertheless arrived at the conclusion that the produce of the *Dioscorea Batatas* will exceed that of the Potato, and that the greater difficulty in taking up will be compensated by the greater amount of nourishment which the tubers contain. It is in order to diminish the labour of taking up that he recommends the Yam to be planted on ridges, following as much as possible the Chinese method described in our former article. The reasons upon which this opinion is formed are the following.

The tubers of the Chinese Yam were in general from 13¾ to 19¼ inches long; seldom more. The upper third is small, perhaps as thick as the little finger; this is in his opinion the only part that should be kept for planting, and, in most cases, three or four slices, large enough to form vigorous plants, may be obtained; the rest of the tuber may be used for food.

It is important that the entire tuber should be taken up, especially since its lower extremity is always the largest part, and that which is richest in starch. By laying out the ground in ridges or narrow beds 10 or 12 inches high, the gardener has only to dig a spade's depth in the side of the ridge or bed, in order to reach the lower end of the root; and by turning over the ridges, so as to level the ground at the same time, the crop may be taken up without difficulty. It is evident, indeed, from what has been stated, that if the sets are planted sufficiently close, the labour in taking up will not be greater than that required for the same weight of Potatoes. M. DECAISNE hesitates to settle positively the breadth of the beds, or the distance from ridge to ridge; but he suggests that a space 20 inches broad planted with three rows of Yams would answer very well. The furrow or space between the beds should not be more than a foot wide—just enough for a man to work in. He adds that the plants should not be staked, because their stems if allowed to spread over the ground preserve its moisture; and also because they may be made to root by a sort of layering similar to that practised by the Chinese, who by that means obtain a considerable increase of produce. This mode of layering is described in our former articles.

It should be understood that M. DECAISNE only speaks of light free soils, and not of those which are compact and harden much with the action of the sun. The former are, in fact, those in which the Yam succeeds best. In China it is exclusively grown in sandy soils where few other green crops thrive.

M. DECAISNE regards the Chinese Yam as superior in quality to the Potato. Although no comparative analysis of the two has been made, he believes that the Chinese Yam is much the richer in point of nutritive principles. Its roots are white as snow in the interior; they neither contain visible fibres nor tough woody matter, and when boiled they become so soft that a slight pressure converts them into a paste, which he can only compare to that of the finest Wheaten flour. Cooked by steam or roasted, they look and taste like the best Potatoes. They have one advantage, which every one will appreciate, namely, the short space of time required for cooking. Two pieces of tubers, of the size of a hen's egg, one the Chinese Yam, the other the *Batate blanche*, were both put into boiling water at the same time with a Dutch Potato of the same size; the first and second were done in ten minutes, the third in 20 minutes. And we must recollect that the facility with which the Potato may be cooked is one of the causes which have greatly contributed to the popularity of the Potato in a culinary point of view, as it requires but little fuel.

Another point of great importance to cultivators is, that it may be kept easily for a year, and perhaps longer. We all know that the Potato is certain to sprout in spring. The Chinese Yam is wholly free from this disadvantage; it is neither affected by cold nor heat, and perhaps not even by moisture. Left in the ground, it remains alive through the winter without injury, as has been proved by a root which passed there the last severe winter, and pushed freely in spring; so that it is a hardy plant in the widest acceptation of the term.

SOME discussion respecting the effect of GRAFTING RHODODENDRONS has lately found its way into our columns, and it is desirable that at the approaching grafting season those interested, either practically or theoretically, in that operation should consider well the real nature of the process. So large a number of facts has now been collected by the united observations and intelligence of modern cultivators, that it has become perfectly safe to speak dogmatically upon what was formerly a subject of constant debate, not only among those actually engaged in the operation, but also among the theoretical investigators of science.

So long as it was believed that absolute wood was formed corporeally from above downwards, it was inferred that the lower parts of a plant must be gradually encased in solid matter derived from branches; and that consequently, of necessity, the stock of a plant must be enveloped in layer above layer of the wood of the scion. It is needless to repeat the arguments employed in support of this view; they were cogent, and for a long time held to be irrefragable. The application of the theory to grafting led, among other things, to the conclusion, that if a scion would take it would speedily form a sheath of wood over the stock, and thus secure itself for ever. Once to form a good union was, therefore, looked upon as sufficient security for the permanent life of the grafted plant. It is true that cases, apparently at variance with the theory, occurred every now and then, but plausible explanations of such instances were readily found.

It is, however, now certain that although wood is formed by a descending process, yet that its descent is not in an organised state. Fluid matter, out of which it is produced, passes, indeed, from above downwards, but the formation itself is wholly local and superficial, and consequently there is no such thing as an encasement of the lower part of a tree by wood descending from above. That important fact having been once established the union of a scion and its stock evidently became a case of mere adhesion, extremely powerful in some cases, feeble and readily destroyed in others. There are therefore two essentially different results obtained by grafting—the one permanent, the other transitory. The practical application of that truth we reserve for another occasion. For the present we confine ourselves to a new demonstration that the nature of the union between a scion and its stock is no other than that now described.

About the beginning of September, 1853, Dr. ALLAN MACLEAN, of Colchester, an ingenious experimentalist and good physiologist, grafted a young plant of the White Silesian Beet upon a root of Red Beet, and *vice versâ*. At the time of the experiment the plants were each about as thick as a straw. A complete junction was effected; and when, in 1854, the plant of White Beet grafted on red was taken out of the ground, its longitudinal section exhibited the appearance represented in the annexed figure. There was a slight contraction at the line of junction, much like that formed by "choking" a rocket case; above the line of contraction the plant was absolutely white, below it it was absolutely red. Not a trace of blending the two colours could be discovered. By similar experiments on other vegetables and plants Dr. MACLEAN had so far assured himself of the perfect independence of scion and stock as to acquire the belief that neither the colouring nor any of the specific characters of the one or the other would or could be altered by their union. The result of the trial wholly confirmed that view, and demonstrated that the White Beet adhered to the Red Beet by mere junction of cellular matter; that of the scion and stock holding together in the first instance, and each afterwards producing its own colouring matter in its own new cells as they formed superficially, the red cells adhering to the white cells while in the nascent state, but retaining each the peculiarity belonging to it, without any interchange of contents through the sides of the cells in contact.

Ground line.

This is entirely consistent with all that has been discovered by the modern physiologists who have applied themselves to a study of the nature of the individual cells of which plants consist. They have clearly shown that each cell has its own special inherent power of secretion; as indeed may be seen by any one who examines thin sections of variegated leaves or other parts. It will then be seen that some cells are filled with a red colouring matter, others with yellow, others with green. In other words one cell has the power of secreting red matter, another yellow, and so on. The colours do not run together, but are contained each within the cell that produces it. Why this is so no one knows: all that we are acquainted with is the fact. In the cells of the Red Beet resides a power of forming red matter, and in those of the White Silesian Beet that of forming yellow; and this peculiarity is not affected by the one growing to the other. Red-forming cells produce their like and yellow-forming theirs. Thus the limit between the scion and its stock is unmistakeably traceable, and notwithstanding the combination of the two sorts in one each perseveringly retains that which is natural to it.

What is true of Beets is true of all other plants, and we shall endeavour on an early day to apply to the practice of grafting the unquestionable facts above explained.

New Plants.

109. CŒLOGYNE PLANTAGINEA.

C. (FLACCIDÆ) pseudobulbis elongatis teretibus, foliis 2 oblongo-lanceolatis 5-costatis undulatis petiolatis patentibus, racemo pendulo glabro multifloro, bracteis "parvis fuscis acutissimis" deciduis, petalis lineari-lanceolatis, sepalis paulo latioribus carinatis, labello ovato-oblongo trilobo acuminato lamellis hypochilii 3 epichilii 4 fimbriatis.

For this fine species we are indebted to the Lord Bishop of Winchester who purchased it, it is believed, at one of Stevens's sales two or three years ago under the above name, which it probably received in India, and although apparently unpublished, is too applicable to be rejected. The plant forms a tapering pseudobulb about 6 inches long, sheathed at the base by acuminate scorched scales, and bearing a pair of firm broad leaves, about a foot long, with five principal ribs, and strong channelled stalks. The flowers appear in a long pendulous raceme not unlike that of *Cymbidium pendulum*; they are greenish yellow with a white lip streaked with brown. The latter has a taper-pointed middle lobe, and is crested with perpendicular fringed plates, of which there are three near the base, and four upon the middle lobe. It is perfectly distinct from all previously known, but approaches *C. flaccida* more nearly than any other. As we have already stated the plant has been for two or three years at Farnham Castle, where, until this year, it resisted all inducements to flower; but eventually his lordship overcame its reluctance by carrying the system of starvation to an extreme extent. The specimen with which we have been favoured was a model of good cultivation; it had been in flower for a month. The bracts had fallen, and we describe them from information communicated by Mr. J. W. Laurence, the Bishop of Winchester's gardener.

VEGETABLE PATHOLOGY.—No. LIV.

239. STERILITY.—It was stated (see p. 231, 1854) that the same effect in vegetable pathology may arise from very different causes, and though the ultimate injury may be identical, the diseases which produce it may in reality be altogether unallied. Such effects may sometimes in point of fact be mere symptoms rather than specific maladies. In a treatise, however, like the present intended for general use, it would not be prudent to draw too nice distinctions, but to treat such subjects as may arise simply and practically. In many instances, therefore, such symptoms will for practical purposes be regarded as disease; and to concentrate attention on each subject, it will be necessary to keep together as much as possible all that bears on one particular point, for unless some such mode were adopted, reference must be made for information to more than one division, and sometimes to every distinct head under which disease may be classified. Where a disease, therefore, arises from constitutional causes and those functional, proper notice will be taken of it under the particular head which treats of such diseases; but if in any case it arise also from other causes, information on such points will be given under the original notice, thus obviating multiplicity of reference, preventing needless repetition, and facilitating comparison of matters similar, though possibly not identical.

240. The disease with which we commence our specific notices, sterility, is a case exactly in point, for though sometimes purely constitutional, and that functionally or organically, it may be equally induced by external causes, and those of various kinds. However induced, it is in most cases a formidable misfortune to the cultivator, and unhappily is at present too often beyond remedy.

241. STERILITY. *Constitutional and functional.*—Both in the animal and vegetable world, wherever copious varieties and races have been produced by long domestication or cultivation, there are marked constitutional differences as regards sterility. In the poultry-yard one race will produce a supply of eggs throughout the year, while another, distinguished perhaps for other good qualities, is notoriously unproductive. The same holds good with the vegetable world; while one variety is extremely prolific, another of better quality perhaps is, under whatever circumstances it may be placed, what is commonly called a shy bearer. If, however, our attention be turned to individuals, we shall find instances of absolute sterility—in the animal kingdom strictly absolute, in the vegetable perhaps only for a season, inasmuch as new organs are formed every year, or at least preparations made, though possibly not complete, for their formation. I am not speaking now of that temporary sterility to which every plant, whether of short or long duration, is subject; for this is no disease, but merely a state of infancy or progress, during which sufficient materials, out of which the exigencies of a fertile condition can be supplied, have not at present been stored up.

Whether this is effected after a few weeks, or only after several years, the matter is just the same, and it is well known that the fertility of young plants may be accelerated by grafting on a ripened stem which can supply what is wanting to the ascending sap. The tendency in the case before us is either to make no progress towards the formation of flowers and their proper organs, or only to proceed through the primary stages of metamorphosis without accomplishing the grand end to which those changes in the leafy appendages tend. It may be absolutely impossible to discover in such cases any organic malformation; but as it is sometimes evidently due to exuberance of growth, it is sometimes equally evident that it is want of tone which produces sterility. If, however, they are really constitutional, and not due at all to external causes, the most judicious treatment may fail, and for the very reason that we cannot discover the precise constitutional conditions to which the effect is due. Means, however, will be taken to repress unnatural luxuriance in the one case, or to give more tone to the system in the other, and such pains will often be rewarded with partial success. It will very rarely happen, however, that inveterate constitutional tendency can be altogether surmounted.

242. One of the most ordinary causes of sterility, whether permanent or temporary, is the hypertrophy of some particular part of the plant, in consequence of which the nutriment which should have been employed in the formation or perfection of the organs of fructification is diverted to some other purpose. Plants, for instance, like Tarragon, which increase much by the root without any abnormal development, seldom produce perfect seed, and trees which send up many suckers or feeders are comparatively unproductive: instances arising from artificial hypertrophy (238), to which multitudes might be added, are mentioned above.

243. The organs of fructification may be apparently perfect, and yet no impregnation may take place, even though the pollen grains may germinate. It is probable that in such cases there is some deficiency of power in the ovules, or the vegetative force by which they are excited, and not in the pollen grains themselves—an inference supported by analogy in the animal kingdom. This force in the pistillary organs is sometimes so great, as in Cœlebogyne, as to supersede the necessity of the anther altogether, a fact analogous to those instances in the animal kingdom where increase takes place by budding, as in several of the Radiatæ. It appears from the mass of facts stored up by Gärtner, Herbert, and others, on hybridisation and muling, that the influence of the male and female parents are not altogether correlative. It does not follow that because the pollen of *a* will produce perfect fruit in *b*, that the pollen of *b* should have the same effect on *a*. It appears, too, that the same male parent does not produce equal fertility in female parents which it is capable of fertilising. The pollen of Dianthus superbus will fructify D. barbatus, Armeria, chinensis, Caryophyllus, caucasicus, and arenarius, but it will not impregnate them in the same degree, and the number of seeds produced will diminish in the order in which the names of the species are written down. External affinity is not always the measure of success. The coats of seeds are sometimes affected even where perfect impregnation does not take place; and as any derangement of the mutual balance of the parts of which an organism consists is more or less fatal to the completion of such delicate processes as the vivification of the contents of the embryo sac, it is conceivable that a thousand circumstances may prove impediments though wholly beyond our powers of research.

244. Strictly speaking, sterility may be absolute, even where there is, according to the gardener's views, a perfect crop of fruit. In some cases, and perhaps in most, succulent fruits will not swell and proceed to perfection without impregnation; but it is certain that in other instances, as in the common Mulberry, the full virtues of the sarcocarp may be perfected without the intervention of any male blossom; and it is notorious that Cucumbers of enormous size, and many other fruit, occur in which it is impossible to find a single perfect ovule. Some of the best varieties of Grapes and Oranges bear no seed, and the same may be said of exotic fruits, as the Banana and Breadfruit. It does not follow, however, that the rudiments of fruit may not exist in the young state, or that the pollen may exert no power. The influence of the pollen is not, however, the only influence which will cause the succulent portion of the organs of fructification to swell. The process of caprification is an instance in point, as also that of touching the orifice of a Fig with oil, or piercing the young walls with an oiled straw. *M. J. B.*

ON RAISING NEW VARIETIES OF PEARS FROM SEED.

What, it may be asked, is the object to be kept in view at the present day, in raising new and improved varieties of Pears from seed? On examining attentively the varieties obtained from seed by our predecessors, and especially those raised from the last sowings of the late Van Mons, it would seem as if the task was accomplished, and that we have only to repose under our laurels. In fact, the vigour of certain varieties cultivated on the Pear stock is evident, their hardiness in our climate is well known, their productiveness is incontestable, and their varied and delicious flavours incline us to think that the conquest is already made, and that the Pear-tree may be almost considered as being acclimatised in our northern latitude, and as having attained perfection. Such being the case, it is a duty incumbent on us to preserve these acquisitions in all their vigour, and without change from disease, by propagating them according to the rational principles laid down in our preceding articles. Thus we may transmit, intact, to posterity the fruit of the labours of our ancestors.

But another much more important duty also devolves on us, and that is not to interrupt the chain of possible improvement. We ought to re-sow successively the seeds of the best hardy kinds of Pears, in order to improve on the results already obtained. The chances of success are not now so problematic as when Van Mons commenced his sowings; for he had to employ either the seeds of varieties of indifferent quality, or those of sorts from more southern regions than ours. By sowing the seeds of these, rearing the seedlings, and sowing their seeds as soon as they bore fruit, and again the first seeds of this third generation, and so on, he obtained six or eight generations in the course of half a century; and by these means, conducted on fixed principles, he has done more for acclimatising and improving the Pear tree in our latitude than chance had during 10 centuries. According to this system, it is no longer necessary to sow the seeds of such old varieties as the Beurré Gris, Chaumontel, St. Germain, or Virgouleuse; and scarcely those of the Passe Colmar, Beurré d'Hardenpont, Beurré Diel, and Beurré Rance. This would be labour in vain; it would be like taking hold of the chain by the wrong end and landing at the bottom, instead of commencing at the lowest link and ascending to the highest. The varieties above mentioned have not, generally, a strong constitution, and they are much exhausted in consequence of a bad system of propagation. The seeds of the following varieties may, however, be successfully employed:—Conseiller de la Cour, Comte de Flandres, Dr. Trousseau, Prince Albert, Duc d'Orleans, Comte de Paris, Rousselet de Janvier, General Dutilleul, Beurré Berkmans, Calebasse Tougard, Nouveau Poiteau, Souvenir d'Esperen, and Triomphe de Jodoigne. In our severe and changeable climate, vigour and hardiness for bearing in the open ground are more especially required. Should the fruit be only second-rate, yet it is better to use the seeds of hardy sorts than those from fruit of first-rate quality produced by trees of a broken-down constitution. The Eyewood, raised by Mr. Knight, must be reared as a pyramid, by means of a support, during the first three years from the bud or graft on the Pear stock; this is a proof of its debility. By careful pruning this variety will form a handsome pyramid in five or six years; but the shoots are too flexible. Its branches have not sufficient substance. Although from its fertility, and the excellent quality of its fruit, it deserves a place in every fruit garden, yet it would not be advisable to sow its seeds with the view of obtaining improved varieties, for the seedlings would most probably retrograde. Marie Louise Nouvelle, of Van Mons, from its greater vigour, and its larger and more delicate fruit, is doubtless several generations in advance of the Eyewood, but appears to have come from the same source. The seeds of this fruit would be preferable to those of the Eyewood; but it would not be advisable to sow either of them. The varieties above recommended make handsome trees, are hardier, and their fruit keeps longer. In obtaining a new variety, which ought to be considered at the present day a real improvement, it ought to possess, as already stated, good vigour, hardiness, and handsome form of growth. In short, the trees ought to bear as orchard standards in our coldest localities. The fruits, in form and flavour, should equal, at least, those which we already possess; and the period of ripening should be later, commencing in December and ending in April.

By following the preceding instructions, astonishing results will be obtained before the end of the century, as regards varieties adapted for orchard culture. In pursuing with perseverance the experiments, a number of varieties will also be found suitable for gardens. It is likewise very probable that some amateurs, knowing the vigour, beauty, and productiveness of a good seedling, will give it the preference, to a certain extent, to propagated trees, which do not always exhibit the most desirable properties. A period will thus be reached when the more intelligent amateurs, in sowing the seeds of a variety, of which the perfection has been carried to the utmost limits, will not plant, trusting to the probability that seedling varieties will spring up and form magnificent long-lived trees, bearing fruit of the highest excellence. This is, moreover, the opinion expressed by Van Mons in various passages of his "Pomonomie." We unreservedly share it as regards our own seedlings, all derived from the last sowings of that skilful pomologist. In fact, out of more than 500 of these seedlings, one could scarcely find 25 which do not exhibit, in their upper parts, all the characters of civilised trees, that is to say, having the appearance of good productive varieties. In the face of such evident facts, it is impossible not to be convinced.

In conclusion, by following a good system of propagation, and improving the condition of trees already existing, the horticulturists of the present day will fulfil their duties in regard to their successors. This, we think, ought to be the aim of every person in all the countries of Western Europe who takes a distinguished part in the cultivation of fruit trees. *J. De Jonghe, Rue des Visitandines, Brussels, Dec. 5, 1854.*

LIST OF ANNUALS.

(*Concluded from p. 6*).

Leptosiphon luteum is a pretty little plant, with needle-shaped leaves. Its flowers are golden yellow, and are produced in abundance. It is well adapted for pots, patches, or beds. One of the very best Californian annuals.

Limnanthes alba.—This is a good thing, either for early or late flowering; it grows about 9 inches high. The flowers, which are produced abundantly, are of a dull white colour; it is best adapted for patches. It is a native of California.

Linaria macoura is a most interesting annual, with flowers like the common Toadflax in shape, and pale lilac in colour. It grows about a foot high. It is a most profuse bloomer, and is well adapted either for beds or borders. It is a native of the south of Europe.

Linum grandiflorum rubrum.—This is a plant of a very delicate and slender habit, much resembling the common Flax. It grows about a foot high, and has large, brilliant red flowers. If it could be induced to flower well, it would be a splendid plant for pot culture. It was introduced from Paris.

Loasa lateritia.—Though much neglected, this is a very pretty plant when treated as a climber and trained on trellis work. Its flowers are pale scarlet, with a dull white patch in the centre. It is rather tender, and requires to be sown in heat. It is a native of Peru.

Lupinus Moritzianus.—This is the very best of the annual Lupines; it grows about 30 inches high, and has an erect habit. It is a most profuse bloomer, with spikes of flowers about 7 inches long. Its blossoms are of a rich blue colour, tipped with white. It is well adapted for borders. It is a native of California.

Malva zebrina.—This, although of a straggling habit, is nevertheless a most beautiful plant, and well worthy of cultivation, growing to the height of 2 feet, with large white bell-shaped flowers, streaked with red. It is well adapted for growing in clusters on borders. It comes from the south of Europe.

Mirabilis Jalapa (Marvel of Peru) is not so much grown as it deserves to be. Its long, trumpet-shaped flowers are highly ornamental. It is a compact bushy plant, which grows about 18 inches in height. There are many varieties differing very much in colour, some being self-coloured, while others are very much streaked. It is best adapted for borders, but ought to be sown in heat, to bring the plants to perfection.

Nolana grandiflora.—This is a creeping Chilian plant, with rather succulent foliage. Its flowers, which are much like those of a Convolvulus, are of a lightish colour, streaked with blue. It is a pretty thing for covering rockwork or small beds.

Oxalis rosea.—This is another of the very prettiest and best of annuals; it grows about 6 inches high. Its flowers are of a pale rose colour, and are produced in abundance. It is a good thing for greenhouse decoration in spring, and open borders in summer. It comes from Chili.

Perilla nankinensis is a pleasing plant, with dark purple foliage, for whose beauty alone the plant is grown. The leaves are much crisped; the flowers are of no value, but on account of the variety it makes it well deserves a place in borders, and requires to be sown in heat. It is a native of China.

Phacelia tripinnatifida.—This is a profuse blooming plant, with dark-blue flowers and a habit like that of a Heliotrope. It is quite hardy, and requires very little attention. It grows about 1 foot high, and is well adapted for beds or patches. It is a native of California.

Platystemon californicum makes a very showy bed, and flowers very early. It grows about 1 foot in height. Its flowers are of a whitish colour, and are produced abundantly. This is also a native of California.

Podolepis rugata is rather a showy plant, and remains a long time in perfection. Its flowers are large, of a pale yellow, much resembling the Old Everlasting; it grows about 18 inches in height. P. chrysantha much resembles it, with flowers of a brighter yellow. It is a native of Australia.

Portulacas.—These much resemble in appearance an ice plant, having succulent stems and cylindrical leaves. They are very showy plants, but require greenhouse treatment, although they may occasionally be turned out in the open border in summer. The best are Thellusoni, which is the strongest growing—it has large blood-red flowers; T. flore plena, with double flowers; splendens, with pale-red flowers; alba striata, with white flowers, streaked with red; and Thorborni lutea, with yellow flowers. They are natives of temperate regions.

Rhodanthe Manglesi.—This is a Swan River Annual, and is a most beautiful thing. Its flowers are large, of a rosy pink colour, and it grows from 9 to 12 inches in height. It remains a long time in perfection. Its best use is for greenhouse decoration in early spring, or it makes a most beautiful bed in summer, but the seedlings require pricking out in small pots to become established previous to transplanting.

Saponaria calabrica is rather a slender spreading plant, with pink and white flowers. It grows about 6 inches high. It is a most beautiful thing, well deserving pot culture, or it is well adapted for beds or borders. It is a native of Calabria.

Silene pendula alba has showy white flowers, somewhat resembling the common Bachelor's Button. It grows a foot in height, and is a most abundant bloomer. It is a splendid thing for greenhouse decoration, and also for beds or borders. It flowers best in peat soil. It is a native of the south of Europe.

Sphenogyne speciosa is a pretty South American plant for blooming through the summer. It bears large orange and black-coloured flowers, which are

produced in abundance. It grows about a foot high. It is well adapted for beds or borders.

Tagetes signata.—This is one of the most interesting and neatest of annuals. It grows about 15 inches high, with finely divided leaves, and its flowers are also very showy; they are yellow, and produced abundantly. It is well adapted for beds or borders. This is also a native of South America.

Venidium eximium.—The flowers of this plant much resemble the pot Marigold, with large coarse leaves. It grows about a foot high, and is a very showy plant for borders.

Whitlavia grandiflora.—This most beautiful new annual was exhibited at one of the Chiswick exhibitions this year for the first time by Messrs. Veitch. It surpasses Eutoca viscida in the beauty of its bell-shaped corolla and long stamens, which exhibit the anthers to so good advantage. It grows a foot high, and flowers profusely. It is a native of California.

Zinnia elegans.—This makes a very pretty bed, and one packet of seed will furnish many varieties. It is a stiff growing plant, about a foot in height. It is a native of Peru. *J. H. Beckman.*

Home Correspondence.

Grafted Rhododendrons (see page 6).—Your correspondent "J. R." must surely be unacquainted with the improved methods of grafting these fine plants now employed by our best propagators, or he would never have written as he has done. I could show him thousands grafted in such a way that nearly all are rooted from the scion, and are on their own roots, whilst it is very rare for them to throw up a sucker. There is much unnecessary declamation against grafted trees, many of which are far better than if they were not grafted. This outcry against them may be attributed to several causes, the principal one being that unthinking persons have sent out trees grafted on stocks on which it was impossible for them to succeed. Thus the evergreen Deodar has been grafted on the Larch. If "J. R." has visited Elvaston, he must have seen hundreds of fine Deodars, all of which are grafted on the Cedars of Lebanon. Who ever saw the English Elm on its own roots throwing up thousands of suckers, equal to the same plant grafted on the Scotch Elm? Would "J. R." plant his walls with Peaches on their own roots? How many of our finest Roses refuse to grow on their own roots but grow vigorously when worked, whilst others are best when not worked. It is only when the stock is unsuitable, or the grafting clumsy, that the effect is bad. How are Camellias to be propagated? The same question may be asked respecting the Purple Beech (surely it is not injured by grafting), the varieties of the Ash, Thorn, and numbers of other things. But to return to the Rhododendron; there are many fine varieties which could not be increased except by grafting, and there are many which grow better and stronger when grafted than on their own roots. No one who has seen the plants, trees I should rather say, shown in London by the Messrs. Waterer, could suppose that they had been injured by grafting. With regard to raising varieties from seed and sending them out (unproved) with names, I know of no practice more dishonest. Although it is true that many seedlings produced by crossing two kinds, as arboreum and catawbiense for instance, may resemble each other, is it right to sell them as altaclerense, when some may prove inferior to that variety, and many in the same bed will doubtless be worthless? Then, again, when one of the parents is a hybrid, perhaps no two of the seedlings will be alike. "J. R." may rest assured that if he ever possesses fine varieties he must have them grafted. *J. R. Pearson.*

Amherstia nobilis.—This fine stove tree is now in flower at Wynyard Park, the seat of the Marchioness Dowager of Londonderry, and I believe that it is the second plant of the kind which has blossomed in this country. The plant under notice was imported in 1852, being then but 9 inches in height, and now it is a fine healthy tree 9 feet high, with five flower spikes on it. The spike now in bloom measures 2 feet long, and has 18 flowers on it, all of which are extremely brilliant in colour. *John Stewart, Wynyard Park, Jan. 9.*

Rain at Melbury House Gardens, Dorsetshire.—1852: November, 13 $\frac{81}{100}$ inches; December, 6 $\frac{79}{100}$ inches. 1853: November, 3 $\frac{44}{100}$ inches; December, 1 $\frac{81}{100}$ inches; 1854: November, 2 $\frac{17}{100}$ inches; December, 0 $\frac{63}{100}$ inch. *S.*

Double Digging.—There must, I apprehend, be some error in terms in Mr. Smith's account of the expenses of labour. Double digging, as understood by gardeners and others, is digging two spits (about 20 inches) deep, and either bringing the bottom spit at once to the surface (usual in market-gardens and nurseries where the soil has been long under spade cultivation) or turning it over and leaving it at the bottom; the latter is my practice in bringing fresh land under spade cultivation, and not, as you assume, bringing at once 10 inches of clay to the surface. It is not till the sixth or eighth year that the bottom spit is gradually brought up, the ground in the meantime having been double dug three or four times. The cost of double digging my land (a tender loam without stones, resting on a subsoil of calcareous clay, at first stiff, but after being stirred very tender) is for the first time 1*s.* 3*d.* per rod, afterwards 1*s.* per rod. Now, this is what is always understood as double digging, and of course when practical men read that this can be done at Lois-Weedon for 4½*d.* per rod they feel that some great difference must exist either in the price of labour or in the method of having it done; it seems to me that the term "double digging" is incorrect if, as you state in p. 4, the depth altogether of the first digging is only 10 inches or one spit. The term "shallow spits" is not, I believe, used by Mr. Smith, and is calculated to mislead; the depth of a spit is understood by all farm labourers as about 10 inches. Mr. Smith says, "The diggings at first are to be as much as two spits deep, but the depth is to be measured year after year until they reach the depth of 20 or 24 inches." The term "two spits deep" has misled many, and I have no doubt has given rise to many failures, owing to the cost of double digging being so much more than the price given in the pamphlet. I know the arable lands of all the eastern counties intimately, and with the exception of the blowing sands of Norfolk and Suffolk, and the loose black soils of the fens, I fully believe that no good corn land can be stirred 20 inches deep under 1*s.* per rod, and no single digging under 3*d.* per rod, and much care is required in having the latter done; the four-pronged (Lyndon or Parkes') fork is the best tool, and this should be thrust into the soil nearly perpendicularly; a "loose hand" will make it form a beautiful slope, and stir a very large surface at a small cost, but to very little purpose, as far as the real interests of his employer go. I give my labourers 3*d.* per rod for single digging between rows of fruit trees 3 feet apart; this seems to approach very nearly to Mr. Smith's practice in digging between his rows of Wheat, requiring about the same care, but then it is double his price. The Lois-Weedon system is so full of interest, and appears so advantageous, that it is of consequence to clear away all obstacles to its being carried out, and the apparent difference in the price of labour can most probably be explained by some one who has tried the system in a stiff soil. *T. R., Herts.*

How to have Good Water in Clay Districts.—The difficulty of procuring good water for domestic and farm purposes, so generally experienced in clay districts where the well water is frequently bad, may, I think, often be overcome by a plan which I have lately adopted with success. The soil is a lias clay; I collect in a cemented tank the rain that falls on an acre and a half of lawn which is thorough drained with pipes 3 ft. 6 in. deep, and adjoins the house. The water is excellent, nearly soft enough to wash with, whereas the well water is not only very saline, but has a nauseous smell and taste. In the first instance the tank was merely lined with dry brickwork, when the water was better than that from the wells, but not so good as it is now. The bad qualities of the well water being attributable to the soluble matters in the clay with which it is in connection, the necessity of a water-tight tank is evident. The small quantity of soluble matter taken up by the rain water in its passage from the surface of the land to the pipe-drains cannot be avoided; but beyond this it may be kept pure, if the tank is effectually separated from the clay. This plan is very inexpensive, and capable of general adoption in country places, where a suitable field to collect the water is almost sure to be found near the house. I think arable land will answer nearly as well as Grass land; and if already drained, the trouble of conveying the water from it to the house, and forming a suitable receptacle there, must be small. In many cases the existing well, if partially filled up so as to exclude the springs, might be lined and bottomed with cement at an expense of only 2*l.* or 3*l.*, and made to answer the purpose. Of course, the size of the tank must be proportioned to the quantity of water required, and there must be a waste pipe from it. *Richard Varden, Seaford Grange, near Pershore.*

Beurré Superfin.—In reply to the queries of M. de Jonghe, I may state in the outset that I have been all my life, now nearly 40 years, accustomed to observe the characters and merits of fruits. I was born in a nursery of fruit trees, I have lived a nurseryman of fruit trees, and I now cultivate for my amusement a collection of upwards of 1300 varieties. I therefore leave M. de Jonghe to judge whether or not I am competent to distinguish the difference between two trees or two fruits. I do not quite agree with M. de Jonghe when he says that the question now, "is *simply* whether the Beurré Superfin has a different form, a different flavour, and period of maturity from that of the Cumberland, figured in the 'Album de Pomologie.'" What M. de Jonghe has to show after what he said in his first communication on this subject is, that the name of Beurré Superfin "was applied in 1846-47, at Angers, to a seedling raised by the late Van Mons, which fruited for the first time in his nurseries in 1827;" and also that the Pomological Society was in ignorance when it did not know "how to distinguish this Pear among a thousand, and restore to it the original name of Cumberland." It is an easily ascertained fact that the original seedling tree of Beurré Superfin is still existing at Angers, and that the original tree of Cumberland is still at Cumberland, in Rhode Island, where it has been since the beginning of this century. Where is the original tree of the Cumberland of Van Mons? *Robert Hogg.* [We think that the public has now had enough of this discussion.]

Coniferæ: Collectors and Cultivators.—The subject which you have permitted to be introduced into your columns (see p. 806, 1854) should not be allowed to remain within the narrow limits in which it has already appeared—I mean the *vexata quæstio* of the difference between two Cypresses. I believe them to be the same, but that is not what I want to write about. The subject to which I refer is that of the history and introduction of many Conifers which are now beginning to show their matured characters, and to prove themselves worthy of distinctive names. That which was of old the *irritamenta malorum* has operated strongly upon nursery gardeners and their lists, wherein many tempting names are found to swell the corresponding list of guineas. Some very good papers have been published in the Horticultural Society's Journal, such as Hartweg's and Dr. Lindley's, Mr. Gordon's, a paper on Himalayan Conifers, and the translation of Endlicher's catalogue, which last, by the bye, has put to confusion many a studiously-labelled Pinetum. But there still remains a hiatus which none but those who live at the fountain-head of horticulture and botany can fill up. Plants are introduced—introducers take their treasures to be presented at court—there they receive their titles, make their bow, and are pushed on by the crowd which follows; they leave their cards and addresses, but sometimes these frail and perishable memorials are lost (as seems to be the case with the ancestors of Cupressus Lambertiana); they slink away into the world of fashion at Chiswick, and there, suffering from the vicissitudes of garden stuff, lose their labels or get misplaced, or, what is worse, are sent out to subscribers, who cut them up for propagation, and when the time comes for their being planted out into the world, their names are obliterated, or replaced from the stores of the gardener's imagination. There are many cultivators and collectors whose object is one of a higher order than that of merely adding names to their collections, or of surpassing some rival in entities of no value. I apprehend that gentlemen who apply their spare moments and spare money to encourage the introduction of rare and beautiful things into this country are in many ways public benefactors; it is unnecessary to enumerate the exotic plants of which the valuable qualities have led to their universal cultivation — plants, I mean, which are now naturalised in our woods and hedge-rows, which were once as rare and curious as the araucaria or taxodium. There are many plants of great promise now in the country of which it is extremely difficult to obtain information. A mere curiosity is a poor treasure. A rusty musket ball would have a value if it were picked up on some hero's grave upon the sad but beautiful banks of the Alma;—so it is with plants. If ever there were a tribe of plants which from its vast variety and combined qualifications of use and beauty surpasses any other, it certainly is that of the Coniferæ: their applicability to valuable uses, their aptitude for purposes of shelter or of beauty is daily more and more apparent. Governments introduce them to replenish or replace old royal forests worn out by centuries of unvarying Oak; artists and gardeners find no contrasts of form or colour without the wholesale introduction of the many-formed many-tinted Conifers; places bare and bleak, cold and ugly, are now filled and furnished; and some day soon, planters who have high and dry light soil unfit for Oak, and ill-placed for Turnips, will begin to substitute the happy family of Pinus Laricio and Deodar for Oak and Ash; and still further draw from the same tribe the means of sheltering the residences, beautifying the neighbourhoods, and filling the pockets of their heirs: but it is upon the collector of the present time that all these good and pleasant results depend. As one of these, I have long wished to see the blanks and omissions of the catalogue published in the Horticultural Society's Journal in 1854 filled up. Many would join with me in cordial thanks to you if you could prevail on the authorities of the horticultural world to open their drawers, or turn back to former pages, and draw out the memoranda which they alone possess, of the introduction of many plants now lying neglected and ignored for want of sponsors. For instance, to name a few, I have tried in vain to discover when and by whom Pinus Bungeana was introduced, certainly the most distinct plant in my collection, and hardy as an Oak; the same too about Pinus osteosperma, a very peculiar species, and the graceful hardy Cupressus Corneyana (miscalled in the Hort. Soc. Journal "the female of the Juniperus sinensis"); Pinus Fordi, very distinct; and the hardy, robust, and rapidly growing Abies Douglasi taxifolia, a strongly marked variety; so too about Pinus Padufiana, and the beautiful Juniperus alba and fragrans, which are species and not varieties; and Cupressus Knighti, which is totally unlike any other which grows; not to omit some concerning which I have lately received inquiring letters, viz., Cupressus Schomburgki and Kæmpferi, Pinus Næsa (Neoza) and P. pallo (palo) blanco, and others, with the names of which I will not swell this already too long letter. I trust your interest and authority will bring forth some of the information which I, in common with many others, greatly desire; and I thank you for the room you have already allowed for intercommunication on this subject. *Pinus Gloucestrensis.*

Societies.

LINNEAN, *Dec.* 19.—Prof. Bell, President, in the chair. J. Newton Loomis, M.D., was elected a Fellow. Mr. Gould exhibited a fine specimen of the Giant Puff-ball (Lycoperdon giganteum), found by him in Muntford Wood, near Somers Leyton, Suffolk. Read: a memoir "on the food of certain gregarious fishes," by Dr. Knox, communicated by W. Yarrell, Esq., V.P. The inquiries, of which the results were given in this paper, were commenced about 1824, and related to the feeding habits of certain fishes of whose history in this particular little or nothing was at that time known. The researches were commenced with the Ven

dace, a fish abounding in some of the Scottish lakes, and whose food was considered both by fishermen and naturalists to be entirely unknown. One forenoon's inquiry destroyed the illusion. Dozens of the fish were opened immediately on being removed from the lake by means of nets, and their stomachs were found to be crammed with thousands of individuals of various kinds of entomostraca, or microscopic shrimps, as they might be called. The solution of the mystery depended simply on placing a portion of the contents of the stomach under a strong lens. The inquiry was next extended to the Char, of which some fine specimens were obtained from Windermere, and the food proved to be the entomostraca with which the lakes abounded. The early spring or Grey Trout, of Loch Leven, were, in like manner, found to have their stomach filled with entomostraca when examined in the early parts of the year, though later they were found to have been feeding on the buccinums, and the common food of trout. The Herring had been the subject of repeated and very extensive investigations. The fish was obtained from the deep sea, and of the hundreds examined, there were only three in whose stomachs were found anything but entomostraca of various species. Of these three, one had been living on sand eels, another on what appeared to be small herrings, and in the stomach of the third were found the shells of about a dozen small buccinums. When near the coast the herring was frequently found not feeding; thus, in the Forth, in the months of January and February, a very large number examined were found quite empty. After spawning, and while close to the shore, they seem to take to other food, as sand-eels and shrimps. In July fine small herrings, which had been feeding on entomostraca, were found to be of good flavour, while others of the same take which had been living on sand eels as well as entomostraca, were insipid and worthless. As to the Salmon, nothing is ever found in the stomachs and intestines of the fresh run salmon but a little reddish substance; this placed under a microscope was found to be composed of the ova of some species of the echinodermata. Of the salmon, while in the sea, this was found to be the constant and sole food. From his researches on this subject the author concludes as an established fact, that many valuable gregarious fishes live, some exclusively, others partly, on the entomostraca. The largest of the gregarious fishes he had as yet observed as living exclusively on the entomostraca was the Early Grey Trout of Loch Leven and the Char; but he had no doubt that on the American continent, there were many admirable fishes of the natural families of Salmonidæ, Corregoni, Clupeidæ, and even others, whose food, when discovered, would be found to be entomostraca of various species.

Entomological, *Jan.* 1.—The President in the chair. The Secretary announced the list of donations to the library received from various societies and authors since the last meeting, and gave notice of the alterations in the council and officers proposed to be made at the ensuing anniversary meeting. The President exhibited a small specimen of a new kind of silk, which he had received from Vienna, spun by the caterpillars of Saturnia spini, and forming a felt impervious to wet, the caterpillars being placed in confined situations and thus compelled to spin their silk in flat layers. He also exhibited a specimen of the species or local variety of Helobia, which he had described many years ago, from Ben Nevis, under the name of H. impressa, and which Mr. Dawson had omitted in his recent work on the ground beetles. Mr. Douglas exhibited the nidus formed of fungoid matter in the centre of a decaying Oak by the larva of Cratonychus castanipes, *Pk.*, a species of Elateridæ not hitherto recorded as a native of this country. Mr. Downie exhibited a model bee-hive on the bar principle, but with certain improvements in the floor both for ventilation and for enabling the refuse to be easily removed. Mr. Samuel Stevens exhibited splendid specimens of Jumnos Ruckeri and Dicranocephalus Wallichii from India. The reading of a series of short notes on the Economy of various insects by Mr. Curtis was continued, amongst which it was recorded that Carabus glabratus and the larva of some species of Staphylinus had been observed to eat earth-worms. Mr. Waterhouse read a paper by himself and Mr. Janson on the synonymy of the British species of the Staphylinideous genus Stenus, consisting of 44 species. Mr. F. Smith read descriptions of a number of new species of ants collected in Brazil by Mr. Bates, and accompanied by very interesting notes on the Economy of some of the species observed by Mr. Bates; amongst which was the notice of the immense swarms of a species of Myrmica which being drowned were found lying in masses on the banks of a river for eight or ten miles. Mr. Edward Brayley suggested that this circumstance was of importance in throwing light upon the occasional accumulation of fossil insect remains of which Mr. Westwood had lately given some curious instances at the Geological Society. Mr. W. W. Saunders also mentioned that on one occasion the shores of Norfolk were observed to be covered with immense numbers of dead specimens of Galeruca Tanaceti, which rendered the coast quite black from the vast accumulation of them.

Notices of Books.

A Month in the Camp before Sebastopol, by a Non-combatant (8vo., Longmans), consists of a series of clever sketchy letters, some of which, we think, we have already seen in the columns of the daily papers. The period of time to which they relate extends from October 6 to November 5, the well-known day of the battle of Inkermann. The author appears to have been a guest of Sir George Brown, and must, therefore, have had good opportunity of seeing what was going forward. He skilfully narrates the stirring incidents which occurred to him, in an agreeable manner, and without dwelling upon the dark side of the picture he has painted.

Tit for Tat (small 8vo., Clarke and Beeton), is an American reply to Mrs. Beecher Stowe and her "Uncle Tom." Those who wish to hear how exaggeration can be met by exaggeration may possibly be gratified by the pages of this book; for ourselves we have no admiration for extravagance and absurdity, to say nothing of bad taste. The authoress may be "a Lady," which we doubt; she certainly is not a gentlewoman.

Australia and its Gold Fields (Ingram), is an account by Mr. Hargreaves of the manner in which he discovered the great gold field of Australia, of its extent, as at present ascertained, and of other matters relating to the subject. To those who are interested in so great a question the statements made by the author will be most valuable, considering that they are incontestably authentic; at the same time his opinions will be received with the respect due to those of a man who, although not pretending to science, has unquestionably a most extensive practical acquaintance with the gold fields of California as well as Australia.

Garden Memoranda.

Mr. Gaines' Nursery, Battersea.—In the show-house here a few plants are now in bloom, such as Daphnes, Epacrises, the Winter Heath (Erica hiemalis), Chinese Primroses, Early Tulips, and Tree Carnations, &c. The last, we need scarcely say, are extremely useful for winter decoration, and for supplying "cut bloom." On the middle of the centre table are Camellias, supported on all sides by large specimen Azaleas. Among Rhododendrons, the young plant of R. javanicum, which was shown in such good condition at a meeting of the Horticultural Society in Regent Street last year, promises again to flower finely this season. Several houses are entirely filled with young Pelargoniums, which are very extensively grown here, not only for "furnishing" but also for the purpose of exhibition. Some of the kinds of Pelargonium used here for forcing are already coming into bloom; they consist of Mrs. Johnstone, Gage, album multiflorum, Phyllis, Surpass Napier, Mars, Gauntlet, and a purple seedling. The various variegated kinds, as Attraction, Mountain of Light, &c., were also plentiful. Of scented Pelargoniums, one of the greatest favourites is Odoratum variegatum, a sort with small leaves, margined with white, and very strongly perfumed. The stage of a lean-to house, 70 feet long, was wholly devoted to the growth of Roses in pots, the varieties employed for that purpose here being Fabvier, Abbé Moiland, Cramoisie superieure, Goubault, and yellow Noisette. These are now coming into bloom, and some Moss and Perpetuals have just been placed under glass to bring them on to succeed them. Cytisus racemosus is cultivated in quantity, large pitfuls of it being here in different stages of growth. Being extremely showy, and remaining a very long time in beauty, it is a plant much prized for all purposes of decoration in which hardy greenhouse plants are employed. For autumn "furnishing," Kalosanths are found to be invaluable, and therefore stagefuls of them are grown here for that purpose. Double white and pink Primulas have been blooming very finely, and keep up a considerable amount of gaiety in several of the houses. Calceolarias, Acacia armata, Fuchsias, Myrtles, and Verbenas are abundant here, more especially the latter, of which there are some thousands. Fuchsias have just been pruned, potted afresh, and put into a little heat to start them into growth. Clove Carnations are already in flower; they consist of some of the most forward layers which had been "potted up" from the open ground and placed under glass, and very useful things they are at this season. Hyacinths, Tulips, Double Jonquils, and Narcissi, have been started into growth, and some of the latter are coming into flower. Of rare plants perhaps the most remarkable was Eugenia Ugni, of which Mr. Gaines has a good stock.

FLORICULTURE.

The Chinese Primrose.—Allow me to correct your correspondent "R. M." in his statement that his conservatory is as gay as it well can be, with all the best varieties of this useful flower. That his plants are good, I do not doubt, but as he says that he raises them all from seed every year, I imagine that his collection would be greatly improved if he would grow a few good plants of the double purple and double white, as I think them superior to the single varieties, either for the conservatory or the bouquet; and as they are as easily cultivated as the latter, I am of opinion that no one should be without them. My method of growing them is as follows. As soon as the plants have done blooming, which is in the latter part of March, or beginning of April, I place them in any cool pit or house for two or three weeks, to renovate them after their exhaustion from blooming. I then examine them, and select what shoots I want to propagate for my next year's stock, but instead of cutting them clean off the plant and striking them singly, as is recommended by some, I layer them in the same way as Carnations, &c., are done, rounding the pot well up with light sandy soil, or pure sand, and watering with a fine-rosed pot until it is well settled. I then place them in any close frame, or propagating house, until they are well rooted, which they will be in a few weeks, and ready to pot off; the largest and best rooted I put into 3-inch pots, and the others in proportion, but always taking care never to over-pot them, as they do better under than over-potted, and never to shift them into larger pots after September. The soil I use is composed of one-half leaf mould, and one quarter each of loam and peat, the whole being well incorporated with small charcoal and sand. *R. F. S.*

Tree Carnations.—Few plants of comparatively recent introduction have proved more useful than these have done. I have a collection of them in flower now, as indeed they have been all through the winter. For supplying cut blooms they are invaluable. They are easily propagated by cuttings, which should be made of half-ripened wood, like the show varieties, cutting them close off below a joint and removing the lower leaves. March or April will be found the best months for putting in a stock for winter blooming, as they will make excellent plants during summer and autumn. Although they strike readily nearly all the year round if placed in a slight bottom-heat, the most healthy of the old plants should be selected and placed in a warm temperature to excite growth prior to the cuttings being taken off. By following this plan they will be found to strike more freely. The pots should be thoroughly drained for their reception, and a portion of rough siftings or moss placed over the crocks. The compost should consist of one-half light sandy soil and one-half leaf-mould and sand run through a fine sieve and well-mixed together. With this the pots should be filled to within about half an inch of the top, the remainder being made up with sharp sand pressed firmly and slightly watered before the cuttings are inserted. If placed in a slight bottom-heat they will not require any bell-glasses to cover them, for if only slightly shaded during sunny days they will very speedily take root. If any of the Grass should decay it should be removed the moment it is perceived, as it creates damp. As soon as they have become sufficiently rooted, pot them into 4-inch pots, still keeping them in a warm moist atmosphere, and stop them, in order to form them into compact bushes. As soon as they have again filled the pots with roots, give them another liberal shift into 7-inch pots, still keeping them in a warm atmosphere, and using the syringe freely until they have got quite established, when they should be gradually hardened off, and finally placed in a cold frame, where they may remain during the summer months. Except potting, stopping the shoots, which should only be done when the wood is in a half ripe state, neatly tying the shoots as they progress, watering when required, frequently overhead, and occasionally stirring the surface-soil, nothing will be needed during the summer and autumn. I have, however, found green-fly troublesome at times, but if the water-pot is frequently used overhead but little need be feared either from them or red spider; if they happen to be attacked by mildew, apply sulphur as soon as it is perceived. When cold damp weather sets in, remove them to the greenhouse or conservatory, where they will come into bloom in succession during the whole of the dull winter months; after they have done flowering, select the most healthy cuttings—the old plants should be cut down for another year or thrown away. The stopping should always be regulated by the time when they are wanted to be in blossom—for instance, for early winter flowering the plants should not be stopped after July, and so on; if the plants are well ripened by autumn, they may, by a little additional heat, be had in flower whenever they are required. The soil best suited for their culture is maiden loam, leaf-mould, rotten cow-dung, and silver-sand, to which may be added a portion of mortar rubbish, in order to keep the soil porous; manure-water, with occasional waterings of soot-water, will be found beneficial during the growing and blooming season. *B.*

Propagating Camellias: *J H.* They are increased by inarching, grafting, and budding on the single red and Middlemas red, cuttings of both of which strike readily. These latter should be taken off in August or September, as soon as the young shoots are ripe. They are prepared by being cut through horizontally at a joint, or better taken off with a "heel," divesting them of a few leaves at the base, and potting them in sand.

Miscellaneous.

Preserved Vegetables for the Crimea.—The appearance of scurvy and dysentery among our forces at the seat of war, and the difficulty of procuring fresh vegetables there, has led to an inquiry at the Army Medical Department as to the best mode of preserving Potatoes, Carrots, Turnips, and other common vegetables. The result has been that a large quantity, preserved by the process of Dr. Verdeil by the house of Morel and Co., of Paris, has been sent to the Crimea. It may be interesting, therefore, to give some account of the process, which is remarkable for its simplicity. It has been long known that vegetables which have been dried with such precaution that they only lose on desiccation the water they contained, return to their natural state on being cooked in water. The unresolved difficulty was to preserve them in the dried state unalterable, for dried plants, like hay, decompose after a time by a slow fermentative process, which gives rise to a peculiar odour. Messrs. Masson and Challet proposed to compress dried vegetables powerfully, and so form them

[illegible], very hard and compressed, in order to diminish as much as possible the surface in contact with the air. But it was soon discovered that this method did not suffice, and that the vegetables so preserved acquired an unpleasant odour and taste. Dr. Verdeil, attributing the cause of the fermentation to the presence of fermentable principles, and to the non-coagulated albumen existing in fresh vegetables, which simple drying leaves untouched, adopted the following process. The fresh vegetable is cooked completely and almost instantaneously by the action of steam pressure. This rapid coction without water does not alter in any way the form or colour of the vegetable, and does not remove either its flavour or its juices; but its vitality is destroyed; its albumen being coagulated can no longer act as a ferment; its fermentable principles are themselves destroyed by this coction at a high temperature. It is then sufficient to dry the vegetable so cooked in a forced current of air. Once dry, it remains unalterable, and may be preserved indefinitely, provided it be protected from water and excessive moisture. We have eaten vegetables preserved by this method, after being boiled in the ordinary manner, and have not been able to detect the slightest difference between them and fresh vegetables. The soup *à la Julienne*, made from a mixture of Carrot, Turnip, Cabbages, and French Beans, is admirable, and will form a most comforting diet for our soldiers. The Potatoes are also excellent. *Medical Times.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Nothing adds to the interest of a collection of plants like cleanliness and neat orderly arrangement; therefore see that the foliage of any of the specimens is not disfigured by insects or filth, and let the pots and everything about the house be kept scrupulously clean. Indeed, the gardener who studies his own interest will give his best attention to these little matters, especially in the show house, for the finest specimens lose half their interest unless they are kept clean and trim. Where necessary, let the foliage of Camellias, Oranges, and such like broad-leaved plants, be carefully washed, and get this done before the blossoms begin to open, as it cannot be done afterwards without injuring them. It is only in very bad cases that it will be necessary to resort to the tedious process of washing the foliage by hand, for a timely application of warm water from the engine or syringe will generally prevent scale, and keep the foliage clean. Cold Pits.—Look over your stock at the earliest convenience, comparing it with your wants, and remove to a growing atmosphere at once such as it may be necessary to propagate extensively. Healthy young wood of Verbenas, Anagallises, and most bedding-out plants root very freely in a mild bottom-heat of about 70°, and soon form nice plants. It is very important, however, that a good stock of cuttings be provided as soon as possible, so as to allow of getting them rooted, and the plants removed to cold frames, thus making room for other things in the propagating house, and securing strong plants, properly inured to the weather by turning-out time.

FORCING DEPARTMENT.

Pineries.—Where leaves and tan are used for affording bottom-heat, a stock proportionate to the demand should be provided the first opportunity, storing the leaves as much out of the way of wet as possible, and the tan in an open shed, allowing it to heat sufficiently to drive off the superfluous moisture it may contain. This prevents its heating excessively when used, and it also lasts much longer, and affords a more regular heat when it can be had rather dry before using. Some of the most forward of the plants for fruiting will probably now be wanted to be showing, and in this case the bottom heat should be increased to about 85°, giving sufficient water to the soil to nicely moisten it, but avoid in this respect the error of many persons, who in their anxiety to get their plants to show at the desired time injure their roots by too much heat. Maintain a sweet moist atmosphere to these and plants swelling their fruit, and take advantage of bright days to dew the plants over with the syringe, and let the temperature rise considerably above the mean. Vineries.—Be careful with houses where the Vines are advancing towards flowering, and maintain a regular temperature, for any check now would be serious. It will not be safe to let the night temperature sink much under 60° after the bunches are perceptible, and 65° should be secured by day, allowing it to rise 10° or 15° with the assistance of the sun. See that the roots are at least properly protected from the vicissitudes of the weather; and if fermenting material is used to warm the border, endeavour to secure a steady heat from it by frequent turnings, and adding fresh materials as may be necessary. Proceed slowly with houses that have just been closed for forcing until the buds are fairly started, maintaining a moist atmosphere either by means of a bed of fermenting materials inside the house or frequent syringings. Let the temperature range from 45° to 50° at night, and from 55° to 65° by day according to the state of the weather. Peaches.—Where the trees are in flower, or the buds beginning to open the syringe should be laid aside, and anything like heavy syringing should not be practised after the buds become prominent. Until the fruit is fairly set, the night temperature should not exceed 50° by means of fire-heat. Take every opportunity of giving fresh air after the buds become prominent, and do this freely on fine days; for there is no chance of getting the blossom strong, or the fruit to set well in a close atmosphere. Strawberries like Peaches require abundance of fresh air and a low temperature until after the fruit is fairly set; for plants being started 45° at night and 50° will be sufficiently high by artificial means, and a little air should be admitted at all times when it can be safely done. If the roots can be afforded a mild bottom-heat without the plants being placed too far from the glass, this will be of great service in inducing a healthy root action. Water with tepid weak manure water. A further portion of the plants to succeed those in heat should be removed to the protection of a cold frame, selecting the strongest plants.

FLOWER GARDEN AND SHRUBBERIES.

Push forward alterations as rapidly as possible while the weather is favourable for such work, and get all planting, &c., finished as quickly as possible. Where it can possibly be done, alterations affecting the removal of large trees and shrubs should be done early in autumn, when transplanting can be done with less risk than at any other season. Also get ground intended for fresh plantations prepared without loss of time, for the longer planting is delayed after this season the more care and expense will be necessary to ensure success. Be careful to secure everything, whether large or small, against the wind, and do not delay this until the plants get blown about and injured after planting. Get plants on walls pruned and nailed, leaving Tea Roses, or anything liable to be injured by the frost to be done in spring after the danger of severe frost is past. See to getting in a stock of briars for next season's budding where this is not already done. Also look to the protection of tender varieties of Roses, or such as have been found not to stand a severe winter uninjured without protection.

HARDY FRUIT AND KITCHEN GARDEN.

Proceed expeditiously with the pruning and nailing of wall trees whenever the weather is favourable for such work, and get the young wood of Peaches and Nectarines unnailed, for if the mild weather continues much longer these will soon be on the move. Pear trees that are infested with scale should be unnailed and painted with a mixture of soft soap and soot, rubbing it well into the crevices of the bark, and if a little clay is added to the mixture it will render it less liable to be washed off by rain. In cases where the scale has been some time established, as much of it should be removed before painting as can be done by means of a very hard brush, or by scraping the bark where this can be done without injuring the buds. Take advantage of frosty mornings to get manure wheeled upon the quarters where it may be wanted, and get all vacant ground dug or trenched as soon as circumstances will admit, throwing it up rough in order to expose the largest possible surface to the action of the weather. Look to Peas that have broken the ground, and protect them from birds, &c. Also get in a farther sowing for succession, or to replace those that are above ground in the event of their getting cut off by the weather, which may happen. Attend carefully to Lettuce, Endive, and Cauliflower plants, &c., under glass, exposing them freely to air on fine dry days, and dust a little fresh lime or soot among them occasionally.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Jan. 11, 1855, as observed at the Horticultural Gardens.

Satur. 20	41.8	30.8	36.3	11	0.65	4	6	4	1	5	6	2	1

The highest temperature during the above period occurred on the 19th, 1828—therm. 60 deg.; and the lowest on the 19th, 1838—therm. 4½ deg. below zero.

Notices to Correspondents.

Australia: *A Sub.* Pack seed intended for this or any other distant colony in coarse canvas bags, and get them conveyed in a cabin where they have plenty of ventilation. You will not get Madras Beans in Europe.

Books: *Diss.* Thanks for the suggestion. Hereafter we will do so, whenever we know, which is not always.

Cucumber Pit: *A G.* We see no objection to the plan, provided the walls, constructed as you describe, can be made to stand. Mills on the Cucumber is a very good book; so is Mearns' little treatise.

Datura ceratocaulon; *A R.* has great difficulty in raising seeds of this plant, and begs for advice.

Gooseberry Caterpillars: *G L.* You will find ample information respecting the best means of destroying these given at pp. 453, 469, and 485 of our last year's volume. White Hellebore powder, if *good*, is the most certain.‡

Names of Plants: *E H.* The fragments seem to belong to some Thunbergia—perhaps T. Hawtayneana or coccinea. *J. P.* Eriobotrya japonica; the Pear is the Chaumontel.—*A S.* Lonchocystis sepulta, J. Sm., *aliàs* Polypodium sepultum, Kaulf., native of tropical America. *S.*—*G A.* Adiantum Capillus Veneris. The frond sent exhibits a very curious case of metamorphosis, tending to confirm the view entertained by Dr. Lindley, and given in the "First Principles of Botany," that the sporangia of gyrate Ferns were "modified leaves." In the present case the fringe consists of minute clusters of young plants, which are produced on the apices of the veins or the under margin of the lamina of the frond, and therefore occupying the place where sporangia would be produced under ordinary circumstances; but in this case a metamorphosis has been induced through the plant having been growing under a bell-glass. The specimen was much shrivelled before it reached us—nevertheless some traces of imperfect sporangia were observed; but further investigation is required by the examination of the "fringe" in its most nascent state. *S.*

Peach Walls: *A S.* Hartley's rough plate is the best glass for all horticultural purposes. If you write to Messrs. Hartley, Sunderland, they will tell you of whom in the west of England you can procure it.

Progress of Horticulture in the United States. *S.* Such a letter should have been authenticated by your signature, &c. We do not object to gardeners going to the United States. You quite mistake us. What we do object to is taking upon ourselves the responsibility of recommending them to do so.

Protecting Walls: *Sigismund.* The plan of covering by means of woollen netting is coming into general use—by way of trial. We give once more the woodcut and explanation, for the benefit of yourself and other new subscribers. They are as follows:—A rod is placed horizontally beneath the coping of the wall. Another horizontal rod is fixed upon posts 3 feet from the bottom of the wall, and 18 inches from the ground; the two horizontal rods are connected at intervals by slight

braces or rods, as is shown in the woodcut. A covering is prepared by sowing woollen netting, on its upper and lower edges, to coarse calico, is then attached to the upper rod by loops and to the lower by pieces of tape; when the protection is complete. Mr. Harrison, of Snelstone Hall, near Ashbourne, Derbyshire, who has tried the plan, states that the cost of the worsted net (which is 2 yards wide), is 1*s.* 8*d.* per yard running. The calico 1 yard wide is 2*d.* or 2½*d.* according to quality. The calico when used is slit down the middle, and one half being sewed to the top, and the other to the bottom of the net, the covering becomes 3 yards wide. The tape and making up he finds of small cost, while of poles he has abundance of no value. The whole together in London, where every article has to be purchased, ought to be under 2*s.* 6*d.* a yard running, including making and putting up. The advantages of this netting are very great; it is fixed up and taken down in two or three hours, set up when the blossom cannot longer be kept back, and remains permanently fixed, until taken down about the latter end of May, when all danger from frost is over.

Red Spider: *S B.* The best remedy for this pest is to paint your Peach trees over now with a mixture of sulphur, soft soap, and clay, brushing it well into all the crevices, so that the whole of the wood may be covered.‡

Rhododendrons: *Ten Years.* Cut them down just *before* the buds begin to swell in the spring.

Rhodoleia: *An Old Sub.* We believe this plant has not yet flowered in Europe. It is a glorious thing. Its right mode of culture is not certain: but we apprehend it *must* have artificial warmth—though not stove heat—in winter.

Tanks: *An Old Sub.* They should be constructed of slate. Iron rusts and lead corrodes by the action of the carbonic acid dissolved in water; the purer the water the more it corrodes. But why will cement crack? It ought not, if good and skilfully used—unless the tanks are pierced by metal pipes, or subjected to great variation of temperature.

Woods and Forests: *J P.* We regret to say that the language of your letter makes it quite impossible to print it. Such a letter would probably lose you your place, and prevent your getting another.

Misc.: *T B F.* Four of the numbers required to complete your set are out of print; the others may be had.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Crate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

JOHN MORREN, GENERAL COMMISSION AGENT, Ock Street, Abingdon, is open for Commissions for the sale of Agricultural Implements, Manures, Seeds, &c., and for the purchase of Corn, &c.

PHILLIPS' PATENT.

THE PRIZE PULPING MACHINE of the Royal Agricultural Society's Show, held at Lincoln, July, 1854.
The First and only Prize ever offered by the Royal Agricultural Society for the best Machine for reducing Roots to a Pulp was awarded to the Machine Invented and Exhibited by FREDERICK PHILLIPS, of The Hall Farm, near Brandon, Suffolk.
FREDERICK PHILLIPS begs to inform the trade that he is prepared to grant Licenses for the making of these Machines.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM-ENGINES, AND COMBINED THRASHING, STRAW SHAKING, RIDDLING, AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as thrashed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. and Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading agricultural shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2¾ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

John C. Cobbold, Esq., M.P.	William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S.	Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq.	Samuel Morton Peto, Esq., M.P.
Thomas Edward Dicey, Esq.	William Tite, Esq., F.R.S.

William Wilshere, Esq.
Empowered to execute, or to assist Landowners in executing with their own Capital and by their own Agents works of Drainage, Irrigation, Road-making, Enclosing, Reclaiming, and the Erection of Farm Buildings upon any Estates, under Settlement, Mortgage, or Disability, and without any investigation of Title, to charge the total amount of the outlay and expenses upon the property improved, to be repaid by annual instalments, varying according to the number of years over which Landowners may determine the repayment shall extend, within the limits of 31 years for Farm Buildings, and 50 years for Drainage, Roads, and other Improvements. WILLIAM CLIFFORD, Secretary.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

The Agricultural Gazette.

SATURDAY, JANUARY 13, 1855.

MEETINGS FOR THE ENSUING WEEK.
THURSDAY, Jan. 18—Agricultural Imp. Society of Ireland.

THE "Markets Improvement Committee" have determined that Friday, the 26th January, shall be the first business day at the NEW MARKET IN COPENHAGEN FIELDS, but we believe it is their intention formally to open it on the previous Wednesday. The time allowed them by the act of Parliament expires on the 1st of February, so that they cannot delay beyond the 26th. The works are in a state of great forwardness, and there will be no difficulty in obtaining the necessary certificate of one of H. M. Secretaries of State as to the fitness of the place, before the day determined on.

Upwards of 30 acres of ground are occupied by the various market places, buildings, lairages, and abattoirs. About 35,000 sheep will find accommodation in the pens; 6600 bullocks can be tied to the railing; 1400 calves, and 900 pigs have standing ground under the shelter of their respective markets. Lairage is provided for 8000 sheep and 6000 bullocks. Slaughter-houses are already partly erected, and more will be built; and a dead meat market is in process of erection. We shall next week give an engraving exhibiting in perspective the general arrangement of the several parts, with descriptive remarks on each, and on the improvements upon Smithfield which they present. Monday, the 22d January, will be the last day of the great Metropolitan Smithfield Market.

A GOOD deal of discussion has been excited by a proposal of Mr. MECHI that the London Farmers' Club should merge into or become the germ of an institution on the model of the great London political or professional clubs; and that the Agriculturist Club should take its place among the United Service, University, Athenæum, and others. It is plain that this would be more than a modification, or even a re-creation, of the existing society; it would be the cessation of the London Farmers' Club, and the commencement of an altogether different institution. The club which Mr. MECHI wishes to see established may be a very desirable thing, and there may be room for it among the other metropolitan institutions of the kind, but there is no reason on that account why the existing discussional society, assembling once a month at York Hotel, Blackfriars, should cease to hold its meetings, or to perform any other of its functions. The two objects are entirely distinct, and are not likely to be united in any institution of the kind which Mr. MECHI indicates.

THE wayfarer in the midland counties must frequently have been struck with the strange and wild appearance presented by hollows and excavations which he often meets with, especially on the east side of the river Severn. These, as they are scooped out of the side of some slight eminence, or occasionally forming a deep pond near some road-side, as at Henwick, Powick, and various places in Worcestershire, at present excite attention by the wild shrubs and flowering plants which fill up the dry hollows or surround the water-filled banks, thus forming spots to which the botanist is often attracted.

The advance of vegetation about most of these excavations attests that it is now some time since they were made, and a moment's thought upon their origin shows that they belong to a forgotten use or a worn out institution. The name of "Marley Hole," which these pits usually bear amongst the cottagers, not only reminds one of the uses to which the contents of these pits were applied, but suggests a few notes upon the use of marl of practical importance.

Fifty years since marl was considered, not only as a manure, but almost as *the* manure, and so much was its use extolled that landlords and farmers made search for marl with as much industry and circumspection as are now employed in seeking for *guano* or *coprolites;* and the possession of a marl pit, without reference to the quality of the marl, was, indeed, a great recommendation in taking a farm or purchasing an estate.

Mr. YOUNG, an agricultural writer of note at this period, says, "All farmers who have marl under their fields, and do not make use of such as a treasure, are to be condemned. In some counties it is the common manure, and almost everywhere to be found when dug for; in such places the farmers have nothing to do but resolve on the undertaking: they all acknowledge the expediency of the work, and seldom dispute the great profit of it, but in other parts the knowledge of marl is very confined."

In the Rural Economy of Norfolk, Mr. MARSHALL, a writer of the same time, says, "Marle has been so long in use in that district that there are few farms without marle pits upon or near them, so that searching for marle is at present seldom requisite, and the art of discovering it not much studied." He adds, "The herb Coltsfoot (*Tussilago farfara*) abounding on the soil is considered as an indication of a jam of marle being situated near the surface."

Now if we consider marl as being an argillaceous deposit, having a tolerably large admixture of lime, we shall not be surprised at another remark by the same author, where he says: "Time and accidents, or intentional researches, have not failed to discover beds of marl in almost every estate, and, in some places, on almost every farm, situated sufficiently near the surface to be worked with advantage." Here, then, the geologist will at once conclude that the marls of different counties may exhibit wide differences, according to the formations whence they are derived. For example, in Worcestershire, the marl pits have been excavated in the Keuper marls, the upper division of the new red sandstone. In Gloucestershire there are now abandoned marl pits in the

lower lias shales, and in Wiltshire the Oxford Clay in the northern parts of the county, and chalk marl in the south, have furnished this ingredient.

Inasmuch, therefore, as marls in different parts of the country vary as to geological position, so we may expect them to differ in chemical constitution; and though as yet analysis of marls which have severally been used for manure is, to a great extent, a desideratum, yet the following analyses, the two first by Professor WAY and the third by Professor VOELCKER, will sufficiently illustrate our present position. These are examples of marls analysed after their value as manure has been long tested in their respective districts; but in the present day we may go further, and determine the value of a marl before the expense of digging, carriage, and trial, has been resorted to.

Note.—No. 1 is from the green sand formation.
2. Chalk marl "extensively applied as a manure."
3. Probably chalk marl, used largely by farmers, who apply it in a powdered state both to pasture as to arable lands.

Now these examples of marls still used show a large percentage of such important matters as phosphates and the alkalies to which their efficiency as manure is mainly due, and consequently where these are absent marls can only act as mechanical ameliorators. Now from their general sterility, where unmitigated by accidental admixture, we know that marls of the Keuper, the lias, and the Oxford clay must be deficient in fertilising properties, which in itself explains the reason for abandoned marl pits and neglect of marling in Worcestershire and Gloucestershire; whilst, on the contrary, the very fact of marling being, even in the present advanced state of agriculture, still followed out in parts of Wiltshire, and with advantage, would lead to the conclusion that the marls in the latter districts contained some important fertiliser, and chemical examination has proved this to be the case.

Some time since, in company with Mr. R. S. MASKELEYNE, the Reader of Mineralogy in the University of Oxford, we examined a large marl pit now being worked at Chisledon, Wilts. The excavation was in the chalk marl of geologists, and towards the bottom of the pit was a thin layer of included nodular masses, from the size of a nut to that of a Walnut, and somewhat of the same shape; these, we found upon examination, yielded equal to 40 per cent. of bone phosphate, and we have no doubt were in reality coprolites. Mr. MASKELEYNE subsequently informed us that he had made frequent examinations of the marl with a view to determine the amount of its phosphatic matter, and that in some specimens he had detected 7 per cent. of phosphate of lime, but he estimated the average at 1½ per cent. of this important fertiliser.

From these few remarks we may safely draw the following practical conclusions:—

1stly. It is not true that every marl, as was formerly supposed, is capable of acting as a manure or fertiliser.

2dly. There are some marls exceedingly rich in fertilising ingredients.

3dly. The value of a marl therefore must depend upon its included chemical substances, which can as easily be determined by the chemist as the position of the marl by the geologist; and

4thly. The present abandoned marl pits of Worcestershire and Gloucestershire are an evidence of the folly of expending money and labour on an extensive scale, without first considering the PRINCIPLE upon which the expected good was likely to result. We may also conclude that, though the Worcestershire marl pits have thus become monuments of farming empiricism, those of the chalk marl of Wilts attest that all marls are not alike valueless.

ONE of the most important among recent contributions to our agricultural literature is a translation from the French. Mons. LÉONCE DE LAVERGNE, one of the Professors in the late National Agricultural Institute of France, has published a volume on the rural economy of this country, which is remarkable for the life-like and accurate pictures it presents of our national agriculture, and even of its local peculiarities.*

It is greatly to the advantage of a description when it depends not merely, nor so much, upon well chosen and well ordered words as upon comparisons or contrasts; and the agriculture of the different divisions of France, well known to M. DE LAVERGNE, is, with great emphasis to the lesson he would teach, being continually cited in this work, and presented to the English reader as the standard of comparison by which the merits and the faults of our agriculturists are exhibited. The work is distinguished by its remarkable accuracy and the skilful manner in which its topics are arranged. We may add, too, that it is written in a vigorous, dashing style—more after the fashion of a review article than of a formal treatise.

We shall shortly call the attention of our readers to it more in detail: at present we confine ourselves to a mere enumeration of its contents. The abundant evidence of agricultural development exhibited in the Crystal Palace in Hyde Park astonished foreigners even more than the proofs of our commercial and manufacturing ascendancy: for the latter they were prepared—the former, nevertheless, told a perfectly true tale. "English agriculture taken as a whole is at this day the first in the world." What are the causes to which it owes this proud position? That is considered, and most ably, in the first 10 or 12 chapters of the work.

The remainder of the volume is devoted to descriptive notices of agriculture in the southern, eastern, western, midland, and northern counties, in Wales, in Scotland, and in Ireland: and the last chapters of this very interesting volume are occupied with a statement of the origin of Ireland's difficulties, and of the means through which she is emerging from them.

M. DE LAVERGNE has written a work which will be as extensively read in its English dress as in its original French. We shall again direct attention to this volume.

CROSS-BRED SHEEP.

YOUR correspondent, W. P. Ayres, calls attention to the successful crossing of Welsh mountain ewes with a Southdown ram, deducing the inference that the practice of putting a large ram to small ewes is both profitable and commendable. "That the breed of small sheep," he tells us, "should be much improved in size by crossing with larger rams, is quite in the nature of things." True to a certain extent, but the practice ought to be regulated by extreme caution. If, for instance, he reason from analogy that because the produce of a Southdown ram and Welsh ewe is good, therefore that that of a Leicester ram and Welsh ewe must be better still, as being a larger male, I have no hesitation in telling him his doctrine is both unsound and dangerous. I speak feelingly on this point, having once suffered from the experiment, both pecuniarily and mentally, more than just now I am either able or willing to divulge. I was many years since persuaded by a neighbour to join him in the purchase of a lot of Scotch mountain ewes, to which we put (more shame for us!) heavy Leicester tups. Of all the pests that ever afflicted man these Scotch ewes were about the worst. They coursed the country like so many greyhounds. No fence could keep them within bounds. They were a constant torment to all concerned, from master to man. We were, however, content to put up with mere trouble; but worse remains behind. At yeaning time we lost, I am afraid to say how many, of both ewes and lambs, from the very circumstance held out by Mr. Ayres as an advantage—the extra size of the lambs, which occasioned a corresponding difficulty in parturition. True, such lambs as did struggle into existence and live, soon beat their mothers out and out as to size and weight; but their numbers were deplorably few, and I never was better pleased than when I washed my hands of the whole concern—a matter I had no little difficulty in accomplishing—for, to say truth, I was thoroughly ashamed of the transaction from beginning to end, and inwardly resolved never to engage in such another speculation, nor let others do so without duly warning them of the probable consequences. I may be thought to attach too much importance to a mere isolated experiment, and to undervalue that related by Mr. Ayres. All I can say in answer is, that if his Welsh ewes brought forth the usual average number of lambs, with only a fair amount of casualties, on both of which points he preserves, perhaps, a judicious silence, he may consider himself in high luck. Still I contend the principle of breeding from large males is bad; and I am fortified in this opinion by the late Henry Cline, Esq., whose able treatise "On the breeding and form of domestic animals," I had not seen when I made my unlucky experiment, or probably I might have been spared that act of folly. Only mark the words of that accurate and scientific observer. "It has been generally supposed that the breed of animals is improved by the largest males. This opinion has done considerable mischief, and would have done more injury, if it had not been counteracted by the desire of selecting animals of the best form and proportions, which are rarely to be met with in those of the largest size. Experience has proved that crossing has only succeeded in an eminent degree in those instances in which the females were larger than in the usual proportion of females to males; and that it has generally failed when the males were disproportionally large." (P. 4). "To obtain the most approved form, two modes of breeding have been practised; one, by the selection of individuals of the same family, called breeding in-and-in; the other, by selecting males and females from different varieties of the same varieties of the species which is called crossing the breed. When a particular variety approaches perfection in form, breeding in-and-in may be the better practice, especially for those who are not well acquainted with the principles on which improvement depends. When the male is much larger than the female, the offspring is generally of an imperfect form. If the female be proportionally larger than the male, the offspring is of an improved form: for instance, if a well-formed ram be put to ewes proportionally smaller, the lambs will not be so well-shaped as their parents; but if a small ram be put to larger ewes, the lambs will be of an improved form. The proper method of improving the form of animals consists in selecting a well-formed female, proportionally larger than the male. The improvement depends on this principle, that the power of the female to supply her offspring with nourishment is in proportion to her size, and to the power of nourishing herself from the excellence of her constitution. The size of the fœtus is generally in proportion to that of the male parent; and therefore, when the female parent is disproportionately small, the quantity of nourishment is deficient, and her offspring has all the disproportions of a starveling. But when the female, from her size and good constitution, is more than adequate to the nourishment of a fœtus of a smaller male than herself, the growth must be proportionately greater. The large female has also a greater quantity of milk, and her offspring is more abundantly supplied with nourishment after birth." (P. 7—9). The following observations are so judicious, and bear with such force on the case mentioned by Mr. Ayres, that I cannot resist transcribing them:—

"It may be proper to improve the form of a native race, but at the same time it may be very injudicious to attempt to enlarge their size. The size of animals is commonly adapted to the soil which they inhabit. Where produce is nutritive and abundant the animals are large, having grown proportionally to the quantity of food which for generations they have been accustomed to obtain. Where the produce is scanty the animals are small, being proportioned to the quantity of food which they were able to procure. Of these contrasts, the sheep of Lincolnshire and of Wales are examples. The sheep of Lincolnshire would starve on the mountains of Wales. Crossing the breed of animals may be attended with bad effects in various ways, and that even, when adopted in the beginning, on a good principle; for instance, suppose some larger ewes than those of the native breed were taken to the mountains of Wales, and put to the rams of that country, if these foreign ewes were fed in proportion to their size their lambs would be of an improved form, and larger in size than the native animals, but the males produced by this cross, though of a good form, would be disproportionate in size to the native ewes, and, therefore, if permitted to mix with them, would be productive of a starveling ill-formed progeny. Thus a cross, which at first was an improvement, would, by giving occasion to a contrary cross, ultimately prejudice the breed. The general mistake in crossing has arisen from an attempt to increase the size of a native race of animals, being a fruitless effort to counteract the laws of nature." (P. 13.)

A few words on the practice of breeding in and in; or, in other words selecting individuals of the same family, in contra-distinction to the system of breeding from males and females of different varieties of the same species, called crossing the breed. Very strong, and apparently plausible objections used to be raised against the in-and-in system, and I am free to confess that I was at one time of the number of the objectors; but I have since had reason to think I was in error, my chief ground of change in opinion being the system pursued by my friends Messrs. J. and T. Brown of Denver, in Norfolk, with which, as a neighbour and pretty constant yearly visitor, I had ample means of making myself acquainted. For more than half a century has their excellent flock of new Leicesters been managed on the in-and-in principle. They let many scores of tups annually, which are justly held in the highest repute by every one who has made use of them; and yet, strange as some people may think it, Messrs. Brown have never on any occasion gone beyond their own flock for the purposes of its improvement and renovation. In fact, it has now arrived at a pitch of perfection as to form and blood, as to render recourse to any other aid completely unnecessary. I have said thus much on the in-and-in system, under judicious management, because, though not perhaps immediately connected with the main subject under discussion—the supposed improvement of mountain sheep—yet it is indirectly so; and, at all events, is a striking and an authentic proof that it may be adopted, not only with impunity, but with decided advantage. *T., Gloucester, Jan. 4.*

EQUIVALENCY OF STARCH AND SUGAR IN FOODS.—By J. B. Lawes, Esq., F.R.S., and Dr. J. H. Gilbert, F.C.S.

(British Association, Liverpool, 1854.)

(Section B: *Read* Saturday, September 23rd.)—*Abstract.*—At the meeting of the British Association at Belfast, the authors had given a paper on the Composition of food in relation to respiration and the feeding of Animals, in which they had illustrated by reference to numerous experiments, that, as our current food-stuffs go, it was the amounts they supplied of the assimilable *non*-nitrogenous, rather than those of the nitrogenous constituents, which measured both the amount consumed by a given weight of animal within a given time, and the amount of increase obtained from a given weight of food. The results which formed the subject of the present communication afforded further illustration of some of the points brought forward in the former one; but these new experiments, like the former ones, had been arranged with reference to certain practical questions, as well as to the more scientific bearings of the subject. Thus, those interested in the growth of sugar had long wished to obtain the introduction of the lower qualities of that article, for feeding purposes, duty free. The subject of the remission of the malt tax, for the same object, had also frequently been agitated. According to the results of the experiments—numerous tables of which were exhibited in the room, and in which the animals (pigs) had been made to rely for about one-third of their total food upon the starch or sugar employed—it appeared that all but absolutely identical amounts of the dry substance of the starch and sugar thus tried against each other had both been consumed by a given weight of animal within a given time, and been required to yield a given weight of increase. The practical identity in feeding value which had from the known chemical relation of the two substances been hitherto assumed, was now therefore experimentally illustrated, and it doubtless only varied in point of fact with their slightly varying per centages of carbon. If, then, sugar have no higher feeding capacity than starch, the relative prices, weight for weight, of sugar, duty free, and of the starchy grains generally used for feeding purposes, would afford an easy means of estimating the probable economy of the use of the former. At the price, including duty, of the coarse Penang sugar used in the experiments, it would cost three or four times as much as the starchy grains at the present time; and it should be remembered that these would also supply a considerable amount of the needed nitrogenous constituents of food. The new results, so far as they could be supposed to apply, considering the difference between cane-sugar and the saccharine matter of malt, were also consistent with direct experiments published by the authors some time since, on the comparative feeding values of malted and unmalted grain. It was true that malt and other saccharine matters might serve in some degree to give a relish to the food, and thus induce the animals to consume more; which, in "fattening," is always a consideration; but this incidental benefit could not counterbalance much increased cost. Indeed, the tendency of all the experiments was contrary to the conclusion that an extensive use of malt for feeding purposes would be such a boon as had been supposed. The proved practical equivalency of starch and sugar in food was also of interest in reference to some other of the views illustrated by the authors in their former papers. Thus it had been shown that a fattening animal assimilated much less nitrogen than had usually been estimated, and that, on the other hand, it might store up very considerably more fat than existed ready formed in its food; whilst this produced fat was doubtless in a great measure formed from the starchy and saccharine substances which constitute so large a proportion of the non-nitrogenous constituents of our staple vegetable foods. It was these, too, which in practice served largely to meet the requirements of the respiratory function, which, it had been shown, under ordinary circumstances, measured to such an extent the amount of food demanded by the animal system.

MODIFICATIONS OF LOIS-WEEDON.

Some time ago a writer in the *Gazette* drew attention to the possibility of growing a summer crop in the intervals of the Lois-Weedon corn tillage; from a failure in such an attempt about 10 years back, I was at the time induced to object to this proposition, and this writer received my objection in good part and with a good grace, as I had found that even with an interval of 3½ feet the Lettuces introduced had been drawn up so as to be useless; the rows of Barley were, however, extremely rank (the straw 5½ feet long). As however such an introduction would evidently be so much gain, I this year determined to try the success of it on a small patch of ground (one-tenth of an acre), in which I was growing Wheat on modifications of Mr. Smith's plan; and I conclude on its feasibility with Turnips, Carrots, and Parsnips which I have tried, and think it will also be found to succeed with Mangold Wurzel, Rape, and open Cabbages, and perhaps with spring Beans, but I should think not with close Cabbages or Potatoes, that is with intervals of only 3 feet. The Wheat ought to be of those kinds having the shorter and stiffer straw; the one I grew was the red-chaffed white, sown after the middle of March, and not reaped till September 30th, which was against the experiments. On June 15th one of the intervals was sown with Sutton's Six-week Turnips; at the time of reaping some of these were from 16 inches to 21 inches in circumference; these are now, November 20th, from 20 to 24 inches, and weigh 4½ lbs. each on an average. On June 23rd the proximate interval was sown with Aberdeens; at reaping some of these were from 10 to 12 inches in circumference; they are now 16 inches, and weigh over 2¼ lbs. each on an average. They only received a dusting of weed-ashes, the ground having been manured the year before. Had the Wheat been autumn-sown, from its earlier removal the Turnips would probably have been now much larger; they might also have been sown earlier.

The further view I had in this experimental patch of ground was to ascertain the effects of some modifications in Mr. Smith's distances; I sowed the Wheat in double rows, 1 foot apart, with intervals of 2 feet and of 3 feet; in treble rows and 3-feet intervals, agreeable to Mr. Smith's plan, and again in double rows, 2 feet apart, with intervals of 3 feet. The produce in the various plans appeared to be pretty equal on equal areas of ground, for the Wheat in double rows 1 foot apart and 2 feet intervals, occupying a breadth of 3 feet, gave an average of 48 lbs. in the straw; add to this one-third to bring it to what ought to be the produce on a breadth of 4 feet, and it would be 64 lbs.; and the double rows, with 3-feet intervals, gave an average of 65 lbs. Add another third to it to bring it to what ought to be a similar produce on a breadth of 5 feet, and it would be 80 lbs., and the treble rows, with the 3-feet intervals, gave 84 lbs., and the double rows, 2 feet apart, with the 3-feet intervals, gave 80 lbs.

In the produce of the grain crop it appears then to be very immaterial whether we have, of course under certain limits, the narrower or wider intervals, but that we have in the wider intervals the advantage of an interlined green crops. With treble rows 1 foot apart there is, however, a great disposition to overlap, and as there appears so little difference in the produce between them and the double rows occupying the same distance of 2 feet, the double rows must on this account, as well as the superiority of their fallow, and the practicability of supporting them by earthing on each side, receive the preference; indeed, I do not know that had the Turnips been tried in the intervals of the treble rows they would have succeeded so well as they did in the intervals in which they were grown, those of the double rows at 1 foot apart.

The intervals of 3 feet may be eligible for the smaller hand-worked plots of the amateur or for labourers' allotments, but on a larger scale, as allowing more room for working the ground wider intervals may be required, say from 3 to 5 feet, and then the corn strips might be widened to 3 or 4 feet. And, perhaps, as I have suggested in a former paper, to permit of the carriage on of manure, and off of crops, in narrow draft carts, the strips of grain may be profitably farther widened, and those of the intervals so as to admit of two rows of Turnips, or so many as may be advisable of other green crops, without such an extension as would forfeit the mutual advantages plants of different composition may derive from their proximity.

I would remark that the strips of Wheat, between which were the Turnips, were in no way inferior to the adjacent ones; but some care was required in the reaping to lay the Wheat lengthways of the strips. *J. M. Goodiff.*

FLAX CULTURE IN IRELAND.

The soil best suited for Flax is a nice dry loam, not too light, and yet not of a clayey nature. The land should be drained and free from weeds; much damp injures the crop, and a quantity of noxious plants rising with the Flax will materially check its perfect development.

In Belgium, Flax is usually sown after Oats, but my experience, and that of my neighbours in this climate, is decidedly in favour of sowing after Wheat. The rotation I should recommend, and what I usually practise, is to break up lea ground in Oats, followed next year by Potatoes and Turnips, &c. Fourth year Wheat, the one-half laid down with Clover and Grass-seeds. Fifth year, Flax (¼), Beans (¼), and Clover (½). Under this rotation, on a farm of 100 acres, the crops would stand thus:—

Grazing	20 acres.
Oats	20 "
Potatoes, Turnips, &c.	20 "
Wheat	20 "
Flax (5 or so), Clover-hay (10), and Beans (5 or so)	20 "
	100

Of course this rotation is subject to frequent modifications, such as stealing a crop of Turnips after early Potatoes, and taking vetches of Rape before late Turnips. Some people might wish for more Flax and others for less; this can be varied at discretion, provided it does not come oftener than once in 10 years on the same soil. It is great folly to put in Flax the first year after a Potato crop; the plant grows too rank to thrive, and the farmer besides loses the intermediate very profitable crop of Wheat, without any real benefit to counterbalance the sacrifice. This folly is sometimes committed by ignorant farmers who think Flax an exhausting crop; whereas, a little scientific knowledge explains that if not grown oftener than once in 10 years on the same soil, it is not a severe crop among the usual group and in its proper place, but quite the reverse. In fact, if sown after Wheat, and the ground laid down with Clover and Rye-grass, it is really an extra crop, grown without manure, and in no way interfering with the Oat crop that usually follows hay or grazing.

Too often the profits of the Flax crop have been over-rated, and much disappointment caused thereby, among parties who tried the cultivation with only moderate success. For my own part I have never been able to reach the immense profits I hear of and see in print, though I have certainly realised a fair remuneration on all average crops. I mention this that novices may not be misled into the idea of making fortunes *all at once* by Flax cultivation; what I desire is to see it introduced by every agriculturist in Great Britain as a portion of the regular rotation on his farm; and if one-twentieth part of the good arable land in the kingdom was thus regularly under Flax, we would be quite independent of any foreign supply, and would possess a stock of fibre and Linseed that would in many ways contribute to the benefit of both the manufacturing and agricultural interests.

As I have alluded to the important question of profits, I may as well introduce here some statements of the actual cost of Flax cultivation on my own farm, carefully prepared for me by my land-steward; also the result of similar experience of several gentlemen about Belfast, who took the trouble of keeping accurate accounts:—

No. 1. Flax grown on Mr. Charley's farm, one statute acre, considered an average crop:—

Dr.	£	s.	d.
To ploughing 1st, 10*s.* 6*d.*; 2nd, 7*s.*	0	17	6
" one grubbing and two harrowings	0	10	6
" twice picked of weeds	0	2	6
" harrowing seed and rolling	0	1	9

Bolls for feeding 30 bushels, at 8*d.*	1	0	0	=	12	16	0
Profit					£3	0	2

No. 2.—Flax grown on Mr. Hunter's Farm, at Dunmurry, 1852, above an average crop:—

Dr.	£	s.	d.
For rent and taxes, 5½ acres (Irish) at 3*l.* 10*s.*, equal to about 8 9-10ths acres statute measure, at 40*s.* ...	19	5	0
For ploughing and preparing ground	13	0	0
For seed	11	0	0
For weeding, pulling, and steeping work, &c.	15	0	0
For scutching at mill	14	10	0
	£72	15	0

Cr.							
By sales, 32 cwt. 10 lbs.	£ 10	17	9				
By ditto, 342 cwt. 21 lbs.	109	6	0	=	120	3	9
Profit					£47	8	9

being 5*l.* 6*s.* 7*d.* per statute acre.

No. 3.—Flax grown on Mr. Coates's Farm at Malone, 1850, a fair crop:—

Dr.	£	s.	d.
To rent of 8 Irish acres, at 5*l.*, nearly equal to 13 English or statute, at 61*s.* 3*d.*	40	0	0
To taxes on same	2	9	3
" ploughing, preparing ground, and sowing	6	12	8
" cost of sowing	19	2	0
" wages for weeding, pulling, and stacking	15	7	9
" rolling, taking off seed, and re-stacking	8	0	8
" commission on sale of seed	1	0	0
" steeping, spreading, and cartage of Flax, cost ...	7	1	10
" To cash paid for scutching at mill	21	12	10
	£121	7	0

Cr.							
By cash received for seed—							
89½ bushls, at 9*s.* ...	£40	5	6				
22 do. kept ...	7	9	0				
By cash received for inferior seed for cattle per flax fibre—							
379 stones of 16 lbs., at 6*s.*	113	14	0	=	161	8	6
Profit					£40	1	6

equal to 3*l.* 1*s.* 8*d.* per statute acre.

This Malone farm is close to Belfast, and the rent is consequently very high for an agriculturist. The price obtained (6*s.*) is rather below the average, and shows the crop was nothing particular in fineness or quality. Mr. Hunter did not save the seed of his crop of Flax, but treated it in the old-fashioned manner, which he thinks most remunerative. Mr. Coates saved the seed for sowing; while my steward took off the seed for feeding purposes only. Both these parties are gentlemen of high standing and probity, and I am sure furnished perfectly correct accounts of their crops and expenses as far as they knew, but I think Mr. H. under-estimated his working expenses a little. *Communicated by Mr. W. S. Hill, of Belfast, to the Journal of the Society of Arts.*

Home Correspondence.

Acreage consumed by Farm Horses.—With all deference to you, I am firm in my conviction that one farm horse consumes the produce of 6 average acres of arable land. If you admit that the cost of a farm horse for his weekly keep is 10*s.* or 26*l.* per annum, the case is at once proved, for M'Culloch, Porter, and Spackman do not allow more for the average gross produce of 1 acre in England and Wales than I stated, and Mr. Lavergne in his recent able and comprehensive volume on "British Agriculture" (translated by a

Scottish farmer), estimates the gross produce at 200 francs per hectare (2¼ English acres), 3*l.* 12*s.* per English acre. This corresponds very nearly with my own estimate made a few years since in a paper I read before the Society of Arts. A farm horse would thus clear 7 acres instead of 6¼, which was my calculation. I will not go into the question whether 72*s.* per acre gross produce is creditable to British agriculture in the 19th century, although I have a strong opinion about it. In a future paper I will again consider the live stock question. *J. J. Mechi, Dec.* 28. [It is a question, we admit, not of what ought to be but of what *is*, but then if we take acres according to their actual and not according to their possible produce, we must take horses not as they ought to be but as they *are* fed. And we don't suppose that on an average farm horses cost nearly 10*s.* a week apiece for food].

Health Commissioners are being established in all towns for the express purpose of examining drains, and making fresh sewers where required to carry off all things offensive either to the eyes or nose—a very proper precaution to prevent effluvia from impregnating the air, arising from decaying vegetable and animal substances so prejudical to life, where in certain states of putrefaction. The removal of such nuisances from the abodes of the working classes will be a boon to them; but to be permanently useful and decrease the amount of cholera, typhus, bowel complaints, &c., &c., a better description of habitations must be erected for the poor to live in, houses or cottages through which the air of heaven may freely circulate, not however through the roofs, broken windows, or crazy doors—rooms large enough for human beings to sleep in with common decency, not dens into which are crammed men, women, and children, so closely packed they touch each other on the floor, the dead often coming in contact with the living. The poisonous gas which these unfortunate creatures are doomed to breathe, when crowded together, is most disgusting. Not only have the labourers and artisans to inhale such a pestiferous atmosphere after a hard day's work, but they are doomed to feed upon unwholesome food in the shape of diseased meat, liberally supplied from the country to the large towns, where it meets with customers, disguised in highly seasoned pies and sausages. The indulgence in this gross food leaves on the palate a craving for beer and spirits, in themselves anything but pure. In addition to all this there is a scanty supply of water for the daily purposes of cleanliness and cooking. It is evident attention to sewage will not remedy the crying evils, under which thousands of industrious men and women are labouring. It must be followed up by attention to other matters so intimately connected with the comforts and respectability of the working classes. No wonder drunkenness and debauchery are prevalent when the whole man is debilitated in body and mind by the horrors amongst which he is compelled to exist. In many cases he flies to the gin palace and beer shop to drown his cares and harden his better spirit against the misery he endures. Frequently the day chosen for his orgies is that set apart as a day of rest from toil, which should be spent in thankfulness for past mercies, as well as supplication for future protection and in innocent recreation after the labour of the week. Our deserted churches speak volumes for the want of precept and example in parents, and watchfulness in pastors. What might not the clergy accomplish by a never-ceasing house to house visitation, not driving but leading the ignorant, obstinate, and prejudiced, to a due observance of higher things, the only true safeguard against vice and wretchedness. *Falcon.*

Blood as Manure.—Can any of your correspondents state what has been proved to be the best mode of applying blood as fresh from a London slaughter-house as a weekly transit into the country will allow? The slaughter-house owner says it is the "only thing he does not turn to account," and has offered to collect it, barrel it, and cart it to the railway. Will its value bear these charges and 30 miles of railway carriage? The country folk do not doubt its being a good thing, but are terribly afraid of its imparting all sorts of diseases to the live stock and the land itself. To meet this risk, it has been proposed to cart it out directly on arrival, and plough it into heavy clay land, with a fair proportion of lime; and by March next to have the land, so manured, ready for Parsnips, Globe, Mangold Wurzel, and Kohl Rabi, all three of which have been produced upon the same kind of land as large and good as want of manure would permit. Is there a cheaper or better way of applying it? *Simplex.* [Your best way of using it is either in compost with earth, turned a fortnight before use on the land, or, as you propose, by direct application to the soil. Dried blood would be worth as much as woollen rags, perhaps rather more; liquid blood may be worth six or seven times its weight of good farmdung.]

Reviews.

Ireland's Recovery; an Essay. By JOHN LOCKE, A.B. J. H. Parker and Son, 445, West Strand.

THE state of Ireland at present is especially satisfactory, not only as regards its social improvement, manifested by the subsidence of political and agrarian agitations, but also by decided progress in its agricultural condition. Among many unquestionable evidences of this twofold amelioration, we have a third publication from the useful pen of Mr. Locke, an official in the Encumbered Estates Court, which places before us facts indicating the degrees in which crime and pauperism have decreased, loyalty and peace advanced, and agriculture, trade, commerce, and manufactures acquired development and expansion, even within the last twelve months. From an official report of the Inspectors General of Prisons, it appears that the number of gaol prisoners throughout Ireland on the 1st January, 1854, was 5,755; the number on the 1st January, 1850, having been 10,967; and in a gradually diminishing series through the intermediate years—less by nearly two-sevenths than in the past year. Taking Limerick, according to Mr. Locke's expression, as "a type" of Ireland—we would limit the typical illustration to the most socially disorganised portions of the kingdom, for there are many counties which have not exhibited political or agrarian crime—we have this gratifying record of amendment:—

COUNTY OF LIMERICK.	Spring Assizes, 1849.	Summer Assizes, 1853.	Summer Assizes, 1854.
Number of Crown witnesses and prosecutors	900	110	84
Number of criminals for trial ...	520	25	19
Of these for murder	11	4	1
In arms, and attacking houses by night	30	0	0
Cattle stealing	63	0	1
Highway robbery	20	0	1

"Ribbonism and offences arising from the competition for land have almost disappeared from the face of the country they had so long disgraced and rendered insecure; and it is a gratifying fact that throughout the vast extent of land, comprising 2,000,000 acres, which has changed hands under the Encumbered Estates commission, only four instances of agrarian crime have occurred since the institution of that tribunal. Whatever be the reader's previous impressions or knowledge of the subject, he will be astonished and pleased at the extraordinary contrast between these two periods (1849 and 1854); nor can any serious mind feel otherwise than deeply grateful to an all-merciful Providence for preserving Ireland intact from taint of crime and disloyalty at the very season when organised disaffection would be most perilous to society and the state."

The tide of emigration is abating, as the necessary result of the rushing efflux which various impulsive agencies have been forcing onward; and it is also turning its course to British North America, whereas the United States and Australia, in a much lesser ratio, had principally been the localities to which it had previously tended. Yet, though there were between 25,000 and 26,000 Irish emigrants fewer in the year 1853 than in 1852, the sum of money remitted in the former year by the pioneer colonists for their relatives to pay for their passage to the colonies considerably exceeded the sum sent in the latter,—the figures being for three years:—

Years.	Number of Irish Emigrants.	Money sent for Passage.
1851	254,537	£ 990,000
1852	224,997	1,404,000
1853	199,392	1,439,000

That the individuals who have thus been quickly enabled to remit money for the conveyance of their friends and relatives to the new locations have been benefited by their expatriation is obvious; and it is gratifying to reflect that the succeeding emigrants have gone with hopeful assurances of success, which experience we believe has realised. We have, for our own parts, no fears that the labour market will be understocked; though wages have risen, they are yet far too low, and the Irish landowners and land cultivators must learn to value the services of the agricultural labourer much higher than they even now consider them. An official report declares that the rise is "1*s.* per week on the average;" we should be better pleased to learn that existing wages are doubled on the average. When this shall take place, any local want of labourers will be supplied from some source or other. "Emigration will of necessity continue to withdraw its hundreds of thousands annually, until deficiency in the labour market compels all employers to raise wages, and landlords to lease land on such liberal terms of rent and tenure as may induce the working classes from motives of self-interest to remain at home.

Pauperism is of course decreasing rapidly in Ireland. "On comparing the number of workhouse inmates for the year ending 22d April, 1854, with the previous corresponding interval, we find the diminution to be nearly 40,000 in each week throughout the series." The returns for last year give nearly 400,000 indoor and more than 13,000 out-of-door paupers; and these unfortunates were fed at the low average rate of 1*s.* 4*d.* per head weekly. The rates were laid it seems so low as to satisfy any reasonable and Christian man who has to pay his share:—"The average poundage on the current year will probably not exceed 1*s.* 3*d.* on the total Poor-law valuation of the island, which generally rates about one-fifth under the letting value." It is our good fortune to pay this year in an English rural district more than 5*s.* in the pound.

The following information is worthy of deep consideration in England, where the notion of employing the workhouse poor in industrial occupations seems to be strangely disliked by the rural magnates. Of the 163 unions in Ireland, there were only 25 in Sept. 1853 in which agricultural instruction was not given, and 1070 acres are attached to the workhouses for the purpose of model farms. At that period 3703 boys were under agricultural teaching, 3196 learning trades, and 14,273 girls employed in household, useful, and ornamental handwork of various descriptions. It is a subject of congratulation that during last year upwards of 5000 boys and girls under 15 years of age have been taken out of the workhouses and put in a way of supporting themselves by their own industry, so highly has risen in public estimation the moral and industrial training of the youth of the country, even in the very abodes of pauperism. We had occasion not long since to publish, in some notes of a tour by our correspondent Martin Doyle, the very favourable return from the agricultural master of the Enniscarthy workhouse. Mr. Locke has presented one from the Ballymoney workhouse, in the most northern county of Ireland, which shows a large amount of profit to the establishment after deduction of about 35*l.* for rent and rates.

"It is a curious fact that this farm, which has been cultivated to so good purpose, has been tilled principally by the boys before and after school-hours. It appears that they are first-rate dirk-men—not *à la militaire*—and act as expert attendants on the dairy. When sufficiently trained, their services are eagerly sought after by the neighbouring farmers, the natural consequence of the information they are possessed of and the good conduct which they evince while in service. In addition to the general instruction in farming which the larger number receive, there is also a special class of 12 or 14 who are taught the theory as well as the practice of agriculture, five hours being given to the latter and two to the former every day; and lately, with a view to promote greater attention to the study in which they are engaged, a plot of ground and seeds for green crops have been given to each, with a promise that the most successful cultivator shall obtain a prize when the harvest comes round."

We would fain see something of this management in our English unions, in which the youthful male inmates are so frequently idle altogether, and therefore meditating mischief and turbulence, and keeping the master in perpetual irritation or anxiety; while the superintendent of the Ballymoney workhouse is allowed by the guardians—who fully co-operate in his views—to keep every one occupied as he thinks best, and the results are good order and the acquirement of industrious habits.

The agricultural report generally is very cheering, but it is clear that the Irishman of every class clings to his Potato with irrepressible tenacity. Turnips, which were threatening to beat them out of the field, have, we have reason to think, retired a little as the others have shown symptoms of returning vigour. In the year 1853, there were nearly 900,000 acres under Potatoes, and about 600,000 under Turnips (400,000) and all other roots included. And without a just proportion of Turnips for sheep and cattle feeding, Ireland will continue backward in agriculture. Both Flax and Turnips had much increased in 1853 over 1852. There is some falling off in both in the present year, though these two are especially suited to the climate and soil of Ireland. Flax cultivation is stated to have increased 500 per cent. since 1848, and of 956 scutch mills erected, 54 are worked by steam. And Ireland, so anomalous in many things, gives an instance of the national characteristic in the fact, that in the last year she exported about 5000 tons of flax (at 58*l.* per ton), with tow and yarn, and imported nearly 9000 tons, at 65*l.* per ton. The yarn exported was valued at 105*l.* per ton, whereas the imported (less than that exported) was valued at 180*l.* per ton. This would indicate superior skill elsewhere in the spinning of fine yarns, or inferiority in the quality of the native raw material itself for the manufacture of some of the finer linens. It is gratifying to learn, that if spinning by steam has thrown out of employment many thousands of hand-spinners, the occupation of 460,000 females in muslin sewing throughout the kingdom fully compensates for the disuse of hands in the former labour, which also was less remunerative than the present branch of employment. Mr. Locke reiterates his opinion, that peat soils are suitable for continuous green crops, instead of yielding, according to the usual rotation, one green crop in four years; and calculating that there are 110,000 acres of peat soil yielding one green crop in four years, he estimates that by substituting continuous green cropping for the four shift system, there would be an increase of upwards of 5,500,000 tons of green food (16 tons per acre) equivalent to the support of 580,000 black stock, young and old. Sulphates of lime, everywhere obtainable on very cheap terms, and in many districts easily formed on the spot, by combining sulphuric acid with calcareous earths, are, according to communications made to Mr. Locke by an agricultural gentleman who has used this manure, certain fertilisers for the purpose. Mr. Irwin informed the Commissioners of Public Works that "tracts of bog and moor are now (in 1853) considered to yield a larger and more speedy return than any other description of improvement, as it is found that tracts of wet spongy bog, which, while unreclaimed, were of merely nominal value, can now be let for a single crop at a rent exceeding the whole cost of reclamation; and that by a very moderate additional application from time to time of clayey and calcareous material they can be profitably continued in tillage for any length of time, being, as already stated, easily and cheaply cultivated, and being also the only lands in which the portable fertilisers can be permanently substituted for farm-yard manure. An excellent example of this important property of peat-soil may be seen in the demesne of Mr. O'Connor, of Milton, whose green crops, grown on reclaimed bog without any manure, except a moderate application of either guano or superphosphate of lime, now rank among the very best in the whole district; and I am informed that on the estate of Lord de Freyne the use of guano on an inferior description of reclaimed bog has been followed by equally favourable results." Seven thousand

five hundred acres have been thorough drained, at an average cost of 4*l.* 10*s.* per acre, which completes a total of 153,160 acres drained under the provisions of the Land Improvement Act. In the mineralogical department there has been an increased activity within the last three years, though the want of cheap carriage from the mineral districts is an impediment to the development of their treasures.

As may be expected, Mr. Locke puts forward very prominently, and, we think, very fairly, the agency of the Encumbered Estates' Court in producing the present prosperous and hopeful state of the land interests through every link of the agricultural chain. Having invited consideration to the appendix and tables, which are designed to assist capitalists in estimating the various circumstances connected with the acquisition of land in Scotland, he thus expresses himself as to the working of the commission.

"It has been brought before the public again and again. In 1850 and 1851, the counties of Galway and Mayo were the most hopelessly involved, and least civilised districts of Ireland. Now, from the sale under the commission, an interval of five years, 550,000 acres, equal to one-fifth of the whole available superficies of these two counties, have been sold in lots to solvent purchasers for a total amount of about 1,500,000*l.* The number of proprietors over this surface (including sub-sales by private contract made subsequent to the sale under the commission), has been increased five-fold; one-third of the purchasers are English and Scotch, and more than one-half of the entire number have not exceeded 2000*l.* in their respective investments. These last, together with English, Scotch, and Ulster farmers, settled of late years on Clew bay and other districts, forming the nucleus of a middle class in the far west. Thus the wealth and skilled industry of our British neighbours have become indissolubly linked with that part of Ireland farthest removed in geographical position, as well as industrial progress, from the centre of civilisation and imperial rule."

Calendar of Operations.

JANUARY.

FORFARSHIRE GLENS.—When the harvest has been favourably concluded in proper season, the two last months of the year have generally little that is interesting in the retrospect. Those just past have meteorologically been characterised by extreme fickleness. One could almost believe that we denizens of the hills were placed in a debatable territory, alternately in possession of the storm spirits of the north and the gentle zephyrs of the sunny south. One hour we are congratulating each other upon the singular mildness of the day, and the next have to retreat before a borean blast more impetuous and more irresistible than a charge of Russian cavalry. The autumn has, upon the whole, been favourable for agricultural operations; snow has only paid flying visits, and frosts, although sometimes severe, have been of short duration, and less than the usual quantity of rain has fallen. Ploughing has been pushed forward at all seasonable periods, and threshing grain, storing roots, &c., have filled up the intervals. The flocks have been healthy during the autumn, and were never in better condition at Christmas; they are all now divided and sent to winter quarters. Cattle have had plenty of sweet straw and fresh roots, and are progressing satisfactorily, and until Mr. Mechi's "Fourth Paper" appeared were expected "to pay;" but as many here are more accustomed to produce before the public a well-fed ox than a correct balance-sheet, they feel the Tiptree dictum to be rather a stunner. Mr. Mechi is worthy of all admiration for the energy he has displayed as an agriculturist, and much benefit will no doubt be derived from his published experience both as a signal of what must be avoided as well as an example of what may safely be followed. Before publishing his next paper he must learn to reason more correctly, and not jump at once to a general conclusion from a few isolated facts. If he should say that live stock at Tiptree don't pay, nobody would dispute with him; but even in that case, if his language is not misinterpreted, his farm pays better with live stock than it would without them: if they do not pay immediately in a direct return of cash, they would seem to do so indirectly in an increased production of corn, and, therefore, ought not to be denounced as an unprofitable speculation. It is not easy to ascertain exactly what Mr. Mechi means by "live stock." In his own practice he seems to purchase lean stock and dispose of it when fattened, and if his experience goes no further, he is ungenerous in bringing a general charge of unprofitableness against the whole beeve tribes in every stage of their existence, and under every system of management. The London cow-feeders pay him a rattling price for his Mangolds, and it is to be presumed they at the same time make a living by cow-feeding. Many families in Scotland are supported solely by the profits of live stock, which is a sufficient answer to the general question, as far at least as the northern part of the kingdom is concerned. Different varieties of stock require different modes of treatment; the black-faced breed of sheep will produce first-class mutton on pastures where Southdowns or Leicesters would starve, and Angus, Aberdeenshire, and the other Highland breeds of cattle in like manner can be brought to perfection on food that may be unsuitable for fattening the more delicate varieties. A feeder of stock is a manufacturer of butcher meat, and if he regards his success must take care that the raw material used does not exceed the proper proportional value of the manufactured article. What would be thought of a paper-maker who should insist upon using Flax instead of old ropes, rags, &c., as his raw material, and on finding his balance on the wrong side of the sheet should turn round and tell the world that paper-making "don't pay?"——The corn crops are not threshing out liberally; in general the produce is not in proportion to the bulk of straw; but this arises less from a want of corn than from a superabundance of fodder. The continued high price of produce has increased the price of farms as well as the number of would-be farmers. Inexperienced hands will doubtless find themselves in the wrong box when prices return by the down train, as doubtless they will at some period, especially those who allow themselves to be bound to a fixed rotation of cropping during the currency of a lease. A 19 years' lease is a good thing; but a fixed rotation, be it what it may, is a very bad thing, both for landlord and tenant. The object of a fixed rotation is to prevent the tenant from wearing out his farm by overcropping, and so reducing its value, which, if the tenant be a bad one, it generally fails to do. The landlord's interest would be better served by providing by the terms of the lease that the farm should be left in a certain specified state at its expiry, leaving the tenant at full liberty to adopt the most approved systems of culture during its currency, and his success would be the best guarantee that the farm should keep both its character and its price in the market. Confine a man to a stereotyped system, and you soon stereotype his ideas of farming, and place a most effectual barrier to his progress. *S.*

WESTER ROSS, *Jan.* 8.—After a month of uncommonly wet and stormy weather, we have now had a week particularly fine, mild and serene. Wheat, for the last few days, has been making rapid progress; the earlier sown is looking thick and healthy; the later sown, which, from the coldness and dampness of the soil, was long of brairding, is now coming up vigorously. Out-door work, which was much retarded for some time, is now comfortably proceeded with. The lot for green crop has been well nigh turned over; a pretty large proportion of lea has been ploughed for Oats, and manure has been carted for Barley, Potatoes, Turnips, &c. Sheep on Turnips find themselves again with firmer footing and greatly more comfortable, and, should this weather continue, which can scarcely be looked for at this early season, they would soon regain what they have lost. Cattle, where well sheltered, have been improving satisfactorily, but with us in the north are a scarce commodity this year, and will, in all likelihood, be very dear. Fleshers complain that a fat beast, even now, is difficult to be met with. At the close of last season they were not only uncommonly dear, but difficult to be had at any price, and not a few of our farmers found it impossible to lay in their ordinary amount of winter stock, and consequently there must be a smaller number to dispose of at our April market. Sheep are greatly more abundant this year, and will, probably, be cheaper comparatively than cattle. In the end of last season, when cattle were scarce and high priced, there was a more limited demand for sheep, and, consequently, not a few remained wind-bound amongst us, and for this reason there will be no difficulty whatever in having our Turnips consumed on more advantageous terms than usual. Good Turnips are now fetching from 6*l.* to 7*l.* an acre; this, with the manure of the sheep, is counted remunerative. We have long been in the habit of estimating the Turnip crop as a losing affair; but when counting the cost of growing Turnips, or the expense of feeding cattle, it is surely scarcely fair to debit the Turnip crop with the whole expense of cleaning the ground, or the whole outlay for manure, as the other crops in the rotation assist in putting the land into that state in which cleaning becomes indispensable, whether Turnips be grown or not, and as a large proportion of the manure applied to the Turnips would be needed, and would be given too, should there be no Turnips sown. It is, in fact, a recuperative season with the exhausted soil, and it is rather much to charge an assistant in the operation with the whole expense of the needed manures and cleansing.

Miscellaneous.

Agricultural Statistics.—As the present experimental collection of agricultural statistics will probably lead to a more extensive inquiry, the following particulars will be interesting:—The West Riding of Yorkshire is one of the counties selected for the present trial, and it is satisfactory to state that the investigation generally is being met in an intelligent spirit by the tenant-farmers, and in all probability but for the nonconformity of some leading occupiers, the number of dissidents would have been much less than it is. The staff employed by the statistical committee of the Doncaster board of guardians have just completed their labours, and we find out of 1673 schedules delivered to the farmers within the union 1480 have been filled up by occupiers, 183 by the enumerators, and only 10 left blank. The union in question comprises 53 parishes, within a radius of 10 miles round Doncaster, and a population, according to the last census, of 33,655 souls. The extent of the union is 98,982 acres, of which 48,320 are under tillage—viz. (in round numbers), Wheat, 17,029 acres; Barley, 10,061; Oats, 2258; Rye, 512; Beans and Peas, 2742; Vetches, 416; Turnips, 10,162; Mangold, 117; Carrots, 8; Potatoes, 1,048; Flax, 15; other crops, such as cabbages, &c., 333; bare fallow, 3,615. There are 37,917 acres of Grass land, including 12,389 acres of Clover, Lucerne, and other artificial Grasses; and 25,528 acres of permanent pasture. The number of acres occupied by houses, gardens, roads, fences, &c., is 1869; and 383 acres of waste attached to farms. Woods and plantations extend over 6301 acres; commons belonging to parishes, 1159 acres; small holdings of less than two acres, 617 acres; and there are 2415 acres unaccounted for. The numbers of live stock in the union on the 1st of July, 1854, were as follows:—Horses, 3806; colts, 969; milch cows, 2879; calves, 2787; other cattle, including working oxen, 4065; tups, 728; ewes, 20,044; lambs, 23,290; other sheep, 10,756; swine, 6735. It is obvious that an important item is still wanting—namely, the acreage produce of grain, but this is an inquiry too delicate to press at present. The opinion of the farmers of the district in question is, upon the whole, favourable to the project of agricultural statistics, and would be much more so if they were fully assured that their landlords had no means of access to their returns—a security which the temporary machinery employed does not afford, as *ex officio* guardians are generally landlords. *Times, Friday.*

Notices to Correspondents.

HORSE FLESH: *Taffy.* The bones, &c., which you have found will do perfectly to make a superphosphate of with sulphuric acid. They must first be broken, torn, or ground, to a coarse powder. As to your pigeon dung, we would mix it with turf ashes, and drill it in with your Turnips; half a ton per acre will show itself on the crop.

ITALIAN RYE-GRASS: *T P.* Sow 35 to 40 lbs. per acre broadcast on a loamy soil when it is damp, and brush it in with light seed harrows towards the end of April. This will ensure you good food in autumn of the same year, and an abundant crop in the following season. If sown after a green crop as Turnips pulled, it will not need manure. Or it may be sown about two bushels per acre with a crop of Barley, just as other Grass seeds. —*J N N.* Sow it any time in April or May; or again after harvest, provided the land is moist and with a sufficient tilth.

ITALIAN RYE-GRASS AND LIQUID MANURE: *J. Mackenzie, M. D.* Dr. Kirkpatrick's experiments were detailed in the report of Mr. Hamilton's paper, given in one of the November numbers of the *Agricultural Gazette.* We will endeavour to draw up such a statement as you propose of the actual manuring of Mr. Telfer's land.

LINSEED: *Simplex.* "English Linseed," *i.e.*, the Flax crop, is of easy and profitable cultivation. Paper-makers cannot afford to give the price per acre for it that linen manufacturers will—and so while it is perfectly possible to make paper of the Linseed fibre before converting it into linen and then to rags, yet it is not likely to be done.—*Cato.* If you use plenty of hay or straw chaff, we should prefer Linseed to Linseed cake. Boil the meal into a thin mucilage or soup; put plenty of salt, and throw it over the cut chaff.

SMALL FARM: *H G.* The answer to your question taken literally is—"Lay it all down to Grass." But we imagine that you have not fully stated your case. You must tell us how much permanent Grass you have in the 100 acres, and also give an idea, whether by stating the rent or otherwise, of the quality of the land.

TIME FOR APPLYING MANURE: *Young Farmer.* Apply manures of slow solubility in autumn, and of rapid solubility in spring. Thus, we would apply farm-yard manure, whether to Grass land or to arable (if we had it), in autumn, either to pastures or ploughed in with the stubbles. Guano we would put over our Wheat in February and March, and nitrate of soda at intervals in March and April.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

SHEET GLASS (15 oz.) of good quality in 100 feet boxes.

10 in. by 8 in. and under ... ... 15*s.* per box.
11 in. by 9 in. to 22 in. by 14 in. ... ... 17*s.* „
Larger sizes to 28 in. by 18 in. ... ... 19*s.* „

Also similar sizes in 21 oz. Sheet at 24*s.* per box. Boxes charged 2*s.* each, and returnable at the same price, if delivered free. CRYSTAL WHITE GLASS, Crown and Sheet Glass in Crates, British and Patent Plate, &c. &c. White Lead, Oils, Turpentine, Colours, &c.—G. FARMILOE & SON, 118, St. John Street, West Smithfield.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in. ...	13*s.* 3*d.*	per 100 feet.
7 by 5 to 8 by 6	13 6	
8½ by 6½ to 10 by 8	14 0	
10½ by 8½ to 14½ by 10½	16 0	
17 by 10 to 18 by 12	18 0	

A great variety of sizes. Particulars had on application.

ORCHARD HOUSE SQUARES on Mr. RIVERS's plan, to whom I have sold some thousands of feet.

Large Sheets for cutting up, in cases, at 2½*d.* and 3*d.* per foot.

HARTLEY'S IMPROVED ROUGH PLATE GLASS, Sheet, and Rough Plate, Tiles, Milk Pans, Bee and Propagating Glasses, Wasp Traps, Cucumber Tubes, Preserve Jars, with and without covers; Fern Glasses.

Plate, Sheet, Crown, and Ornamental Window Glass. Crystal Glass Shades for ornaments.

Greenhouses, erected in either wood or iron. Garden Lights and Frames.

87, Bishopsgate Street Without, London—same side as Eastern Counties Railway.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present prices of Glass for Cash:—

	SHEET SQUARES. In Boxes of 100 feet.	CROWN SQUARES In Boxes of 100 feet
Under 6 by 4	£0 12*s.* 6*d.*	... 8*s.* 6*d.*
6 by 4, and 6½ by 4½	0 13 0	... 12 6
7 „ 5, — 7½ „ 5½ / 8 „ 6, — 8½ „ 6½	0 15 0	... 14 0
9 „ 7, —10 „ 8, 12 by 9, 12 by 10, 14 by 10	1 0 0	

Larger Sizes, not exceeding 40 inches long.

16 oz. from 3*d.* to 3½*d.* per square foot, according to size.
21 oz. „ 4½*d.* to 5*d.* „ „ „
26 oz. „ 6*d.* to 7½*d.* „ „ „

SIXTEEN-OUNCE SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, THE SAME QUALITY AS WE SUPPLY TO Mr. RIVERS, and of various dimensions, always on hand,

Double-crown Glass of various dimensions in 100 feet boxes.

Glass Tiles, ¼ of an inch thick, packed in cases, containing 50, at 1*l.* 17*s.* 6*d.* per case. Packages 2*s.* each extra, but allowed for when returned.

GREEN AND HOT-HOUSES made by machinery, at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Sent to all parts of the United Kingdom. These buildings are warranted of the best materials, and put together in a superior manner. Being manufactured by steam-power, they are considered the cheapest and best made in England. The Trade and Merchants supplied at wholesale prices. List of Prices by enclosing two postage stamps.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

GODFREY'S BLACK SPINE.
SPLENDID AND PROLIFIC FRAME CUCUMBER.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom: average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2s. 6d.; 6 ditto, 1s. 6d.

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1s. each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, January 13.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4s. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9s. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12s. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

SNOW'S SUPERB BROCCOLI.—Every seed new and true. Sealed packet, 1s.; per oz., 3s.; pound bags for the trade on liberal terms.

GLENNY'S IMPROVED BALSAM.—Unequalled for size, doubleness, and colour; 6 classes, 3s.; mixed, 1s.; sealed packets with culture.

DOUBLE HOLLYHOCKS from noble flowers. Sealed packet, 1s.

Stamps or P.O. orders to GEORGE GLENNY, Horticultural agent, Dungannon House, Fulham. Sales, valuations, &c., attended; Ground Laid Out, Rockwork, Ornamental Water, &c., planned and executed.

FLEMING'S HYBRID CASHMERE MELON.—The above new Melon was raised by Mr. Fleming at Trentham, and exhibited by him for the first time at the Great Meeting of the Horticultural Society of London at Chiswick on the 10th June last against a multitude of competitors, when it was awarded the first prize, and pronounced by the judges to be very far superior to all others produced, and decidedly the best Melon known. The entire Stock is in the hands of the undersigned. Packets of Six Seeds, 2s. 6d.; of 15 do., 5s.

R. GLENDINNING, Chiswick Nursery, London.

PYRAMIDAL PEAR TREES ON QUINCE STOCKS.

J. AND J. FRASER have to offer a very fine collection of the best varieties of PEARS grafted on the Quince; descriptive Catalogues of which may be had on application.

In offering these Pears, grafted on the Quince stock, we would wish particularly to call attention to their many excellent qualities. They are very compact in growth, and most prolific in bearing, fruiting profusely while the trees are small; thus forming a great acquisition for a small garden. Planted by the side of walks, in addition to their utility, they add much to the neatness and beauty of a kitchen garden. Indeed too much can scarcely be said in favour of these miniature Pear trees; as a proof of their merit the demand for them is yearly increasing.

Strong Trees, showing Fruit Buds, 2s. 6d. to 3s. 6d. each.

Lea Bridge Road, Essex, January 13.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

- Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
- Cedrus Deodara, in any quantity, from 1 to 3 feet high
- Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
- Cedars of Lebanon, 3, 4, 6, and 10 feet high
- Pinus Douglasi, 3 to 10 feet
- " insignis, 2 to 7 feet
- " Menziesi, 3 to 7 feet
- " Pinsapo, fine plants, 3 to 6 feet
- " Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
- " nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
- " Montezumæ, 2 to 4 feet
- Pinus canadensis, 3 to 8 feet
- Cupressus macrocarpa or Lambertiana, 4 to 7 feet
- " thyoides variegata, 3 to 4 feet (the variegated white Cedar)
- Juniperus, Upright Irish, perfect columns, 3 to 7 feet
- " chinensis, 2 to 8 feet
- Yew, common English, 3 to 8 feet
- " Irish, 4 to 10 feet
- " gold-striped, 1½ to 3 feet
- " do., tall standards, 4 to 7 ft.
- " Dovaston, or Weeping, worked on tall straight stems
- Thuja aurea, the finest plants in the country
- Libocedrus chilensis, the finest plants in the country
- Large variegated Hollies
- " Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2d. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

SUTTON'S GRASS SEEDS (CARRIAGE FREE). NATURAL GRASS SEEDS FOR PERMANENT PASTURES, separate or mixed, expressly to suit the soil.—Messrs. SUTTON and SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of the Grasses which thrive in the various soils of Great Britain and Ireland, are enabled to supply the sorts and quantities of Seeds, varied to suit the soil for which they are intended. The cost will vary from **24s.** to **30s.** per acre, according to the sorts and quantities the soil requires.

FINE LAWN GRASS SEEDS, for making New or improving Old Lawns, price **1s.** per pound, 2s. 6d. per gallon, or 20s. per bushel. For forming new Lawns, 2½ bushels, or 50 lbs., is the quantity required per acre.

FINE GRASS AND CLOVER SEEDS FOR IMPROVING OLD PASTURES (SUTTON'S Renovating Mixture). Quantity required per acre, 8 lbs. to 12 lbs. **price 9d.** per lb.

N.B. It will be seen above that we have greatly reduced the prices of our Grass Seeds this season, especially the fine Lawn Seeds and "SUTTON'S Renovating Mixture" for improving Meadows and Pastures; and we doubt not that our liberal charges will induce a more general practice of sowing our superior kinds of Grass Seeds.

SUTTON & SONS, Seed Growers, Reading, Berks.

RENDLE'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready. They can be had to suit various sized Gardens at the following prices:—*

No. 1 COLLECTION	... ...	£3 0	0
" 2 "	... ...	2 0	0
" 3 "	... ...	1 5	0
" 4 "	... ...	0 15	0

The quantities are fully detailed in their "Price Current and Garden Directory," a new edition of which is just published.

WILLIAM E. RENDLE & Co., Seed Growers, Plymouth.
ESTABLISHED 68 YEARS.

SUTTON'S COMPLETE COLLECTIONS, CARRIAGE FREE.

PARTICULARS OF THE SORTS AND QUANTITIES CONTAINED IN SUTTON'S COLLECTIONS OF SEEDS will be sent post free on receipt of a stamped envelope with address.

By the perusal of this List, it will be seen that the very best kinds of Vegetable Seeds may be obtained in full quantities, and proper proportions for one year's supply of a large garden for the sum of 3l., and other complete Collections of equally choice sorts for smaller Gardens at 2l., 1l. 5s., and 15s. The economy of cost is by no means the only advantage gained by ordering one of these Collections.

Address, JOHN SUTTON & SONS, Seed Growers, Reading.

GRAPE VINES FROM EYES.

R. GLENDINNING has a large Stock of the undermentioned Vines, extra strong in pots, with well ripened wood, 5 ft. and upwards in the canes. Some of the kinds are new, and which have been proved and found of first-rate quality:—

Black Hamburgh	Cabul
The Pope's Hamburgh	Gromier du Cantal
Wilmot's Hamburgh	Welbeck Tripoli
Mill Hill Hamburgh	Grove End Sweetwater
Victoria Hamburgh	Pitmaston White Cluster
Barnes's Muscat	Chasselas Musqué
Reeves's Muscadine	Black Barbarossa
Raisin de Calabre	Muscat non de jura
White Frontignan	Chasselas de Fontainebleau
Grizzly Frontignan	Royal Muscadine
Black Frontignan	Large White Sweetwater

Chiswick Nursery, London.

SELECT PEAR TREES. The following extract from the "Miniature Fruit Garden" is a list of 24 fine varieties of PEARS that succeed well on the Quince Stock, and form handsome pyramids and bushes, ripening in succession from July till April and May.

Pears for Pyramids, 2s. each.

Doyenné d'Eté	Beurré Sterkman
Colmar d'Eté	Zephirin Gregoire
Baronne de Mello	Winter Nelis
Louise Bonne of Jersey	Bergamotte d'Esperen
Alexandre Lambré	Beurré d'Anjou
Beurré d'Aremberg	Prevost

The above form very handsome pyramids, they have been carefully pinched in, so that they are well furnished with young branches down their stems, most of them have blossom buds, and will bear this season.

Pears for bushes, 2s. each.

Alexandre Bivort	Melon de Namur
Beurré d'Amanlis	Onondaga
" Diel	Nouveau Poiteau
" Langelier	Grosse Calebasse (C. Carafou)
" Wetteren	Doyenné Boussoch
Maréchal de la Cour	Rousselon (Esperen)

The above nearly all bear large fruit, and when grown as bushes are well adapted for gardens exposed to the wind; they bear profusely and require scarcely any care in pruning; the trees offered are mostly full of blossom buds, and will bear this season. A Descriptive Catalogue of Fruits sent for four stamps, the cost of postage. Carriage paid to London.

THOMAS RIVERS, Nurseries, Sawbridgeworth.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in kets at 2s. 6d. each.

Each may be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

HOLCUS SACCHARATUS,
OR CHINESE SUGAR CANE.
(See GARDENERS' CHRONICLE, Dec. 30th, 1854.)

MR. JOHN HENDERSON, formerly of the firm of JOHN A. HENDERSON & Co., Pine Apple Place, London, has the honour to announce that he is prepared to supply Gentlemen, Amateurs, and Professionals, with seed of this most valuable and estimable plant.

As the Dioscorea Batatas seems well adapted to make good any deficiency arising from failure in the Potato crops, so this appears admirably calculated to meet many wants of the present day. That it may be used for the purposes of distillation, and may therefore preserve the grain of the country, is not less certain than that the leaf and stem (after the saccharine matter has been extracted) contain a large amount of fibre, of such a nature as can be employed in the manufacture of every kind of paper. In both these points, as well as in many others, this plant demands the attention of every Gardener and Amateur throughout the country; the more so as from the necessity that at present exists for the production of fibres that may be used in paper manufacture a due remuneration may be fairly expected by growers, even after the plant has, so to speak, paid itself by the saccharine matter extracted from it.

Mr. HENDERSON hopes, in a few days, to have ready for the press a more lengthened account of this plant, as well as a complete statement of the latest experiments in connection with the Dioscorea Batatas. As there are many varieties of the Holcus W. J. H. can only be responsible for seed forwarded by himself, which he is prepared to do in sealed packets, at 1s., 2s. 6d., 5s., and 10s., according to quantity.

Orders to be accompanied with a remittance to Mr. JOHN HENDERSON, Kingskerswell, Newton Abbot, South Devon.

P.S. Price to the Trade can be had on application.

CHARLWOOD AND CUMMINS have to offer SEEDS of the LILIUM GIGANTEUM in packets of 100 Seeds, at 20s., free by post. Also Acorns of the following varieties of American Oaks:—

Quercus alba	per quart 2s. 6d.
" Banisteri	
" obtusiloba	
" nigra	
One-year's Seedling Plants of each ...	per 100 ... 3s. 0d.
Abies Pinsapo	per 100 seeds 8s. 0d.

They will also have in time for this Season's sowing Seed of the Osage Orange, at 4s. per lb., for which early orders are solicited. Their Catalogue of Agricultural, Garden, and Flower Seeds are ready, and will be sent free on application.

14, Tavistock Row, Covent Garden.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

LANDSCAPE GARDENER AND GARDEN ARCHITECT.

MR. W. DAVIDSON is about concluding his engagement with Sir Wm. F. F. Middleton, Bart., of Shrubland Park, in consequence of the completion of extensive alterations on which he has been there employed; and respectfully tenders his services in the above capacities to noblemen and gentlemen, and the public generally, in Laying-out or Improving Gardens, Grounds, Parks, Cemeteries, Arboretums, &c.

Mr. D. feels strongly the importance of the opportunities he has had of maturing his taste for natural arrangement and artistic design under Sir William and Lady Middleton, and appeals with confidence to Shrubland for examples of his practical and scientific knowledge as a civil engineer in directing the satisfactory and economical execution of the various works. He begs to mention further that his practical experience enables him to offer advice upon all matters connected with a garden, both structural and cultural.

Mr. D. is kindly permitted to refer to Sir Wm. Middleton, Bart., of Shrubland Park, Ipswich; Sir Charles Barry, Westminster; Dr. Lindley, and many others who are pleased to consider him worthy of their patronage and recommendation.

Shrubland Park, Ipswich.—Jan. 13.

TENTS, MARQUEES, AND RICK CLOTHS.—Now on Sale, several second-hand Rick Cloths, Marquees, and Tents, of various sizes. Some of the Marquees are well adapted for Horticultural Societies. One 50 feet by 30, price 35l.; one 70 feet by 30, 50l.; and one 100 feet by 30, 65l. These are almost new, and quite ready for use. Small tents for the Wars or Emigrants, weighing 12 lbs., price 25s. each, new and waterproof. Small Tents for Gardens, 30l. each.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

BLOSSOM OF FRUIT TREES.—WORSTED NET to effectually protect the blossom of wall fruit trees from frost and blight, and the ripe fruit afterwards from wasps and flies, 7d. per square yard, in various widths. All kinds of garden, fishing, and sheep nets, made by machinery, and at very low prices.—R. RICHARDSON, 21, Tonbridge Place, New Road, King's Cross, London.

TO PARENTS AND GUARDIANS.—The return of youth to the respective boarding-schools induces a solicitude for their personal comfort and attraction. Now it is that ROWLANDS' MACASSAR OIL, for accelerating the growth and for improving and beautifying the hair, ROWLANDS' KALYDOR, for improving the skin and complexion, and removing cutaneous eruptions, and ROWLANDS' ODONTO, or PEARL DENTRIFICE, for rendering the teeth beautifully white and preserving the gums, are considered indispensable accompaniments for the attainment of those personal advantages so universally sought for and admired. Beware of Spurious Imitations. The only Genuine of each bears the name of ROWLANDS' preceding that of the article on the wrapper or label.—Sold by A. ROWLAND and SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, ELLEN GRAHAM'S NIOUKRENE is unfailing in its efficacy. It reproduces the hair when lost by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce Whiskers, Moustachios, &c., in three or four weeks. For beautifying the hair, and sustaining its curling powers, it has no equal. Sent post free on receipt of 24 penny post stamps, by Miss GRAHAM, 10, Chichester Place, King's Cross, London. "My whiskers are greatly improved." J. SHORT, Dudley.—"It has produced hair where I was bald." W. MORGAN, Milford.—"My hair has thickened since using it." Miss COWIE, Bridgewater.—"I have a full pair of whiskers." H. ROBB, Hertford.—"It has effectually checked the greyness." Mrs. HOOD, Dorking.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2s. per Package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, &c.?—COUPELLE'S CRINUTRIAR, though extensively imitated, is universally acknowledged as the only preparation to be really depended upon for the unfailing production of Hair and Whiskers in two or three weeks; as also checking Greyness, Baldness, &c., and rendering the Hair beautifully luxuriant, curly and glossy. Mr. WILLIAMS, 8, Lowther Street, Liverpool.—"I can now show as fine a head of hair as any person, solely from using your Crinutriar." Sergeant CRAVEN, Longford Barracks, Ireland.—"Through using your Crinutriar, I have an excellent Moustache, which I had before despaired of." Mrs. CARTER, Pangbourne, Berks.—"My head, which was quite bald, is now covered with new hair." Price 2s. per package, through all Druggists and Perfumers, or sent post free on receipt of 24 penny stamps by ROSALIE COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, &c.?—If so, use PALMAPILLA, declared by thousands of testimonials to be magical in its effects. In all cases of baldness it is a certain remedy, causing a thick and luxuriant growth, strengthening weak hair, preventing its falling off, and checking greyness in all its stages. For the production of Whiskers and Moustaches in two or three weeks, it has never been known to fail. Price 2s., sent post free (anywhere) on receipt of 24 penny postage stamps by Miss ALICE MELVILLE, 25, Argyle Square, King's Cross, London.—"I was quite bald, but have now a good head of hair." *Wm. Hopton.*—"My whiskers are growing very thick." *R. Mede, Esq.*—"It restored my hair, which I had lost in patches." *W. Sturt.*—"It has quite checked the greyness." *Miss Ellis.*—"My moustache is greatly improved." *Capt. Ross.*

NOTICE.

OVER-COATS, CAPES, &c.—One of the largest stocks in London of every description, first-class garments, at lowest charges; also of Youth's ditto, all made thoroughly impervious to rain, without extra charge, or made to order at a days' notice.—W. BERDOE, 96, New Bond Street, and 69, Cornhill (only).

FORD'S EUREKA COLOURED SHIRTING is now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27*s*.

FORD'S WHITE EUREKAS, best quality, Six for 40*s*.; second quality, Six for 31*s*.; if washed ready for use, 2*s*. extra.

CAUTION.—Ford's Eureka Shirts are stamped, "38, POULTRY, LONDON," without which none are genuine.

*** Catalogues with particulars post free.

RICHARD FORD, 38, Poultry, London.

CUTLERY WARRANTED.—The most varied assortment of TABLE CUTLERY in the world, all warranted, is on Sale at WILLIAM S. BURTON'S, at prices that are remunerative only because of the largeness of the sales; 3½-inch ivory-handled table knives, with high shoulders, 11*s* per dozen; desserts to match, 10*s*.; if to balance, 1*s*. per dozen extra; carvers, 4*s*. per pair; larger sizes, from 14*s*. 6*d*. to 26*s*. per dozen; extra fine, ivory, 32*s*.; if with silver ferrules, 37*s*. to 50*s*.; white bone table knives, 7*s*. 6*d*. per dozen; desserts, 5*s*. 6*d*.; carvers, 2*s*. 3*d*. per pair; black horn table knives, 7*s*. 4*d*. per dozen; desserts, 6*s*.; carvers, 2*s*. 6*d*.; black wood-handled table knives and forks, 6*s*. per dozen; table steels, from 1*s*. each. The largest stock in existence of plated dessert knives and forks, in cases and otherwise, and of the new plated fish carvers. Also a large assortment of Razors, Penknives, Scissors, &c., of the best quality.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS devoted to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1*l*.—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l*. Hermetically-sealed Inodorous Chamber Commodes, 1*l*., 2*l*. 4*s*., and 3*l*.; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square, London.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s*. per box.

THE CONSERVATIVE LAND SOCIETY.—The OLD FORD ESTATE, in the Parish of St. Mary, STRATFORD-LE-BOW, Middlesex, within the Borough of the Tower Hamlets.—This valuable Estate will be ALLOTTED at the Offices, No. 33, Norfolk Street, Strand, London, on WEDNESDAY, the 24th of January. The Old Ford Estate has a frontage on the Old Ford and Bethnal Green Roads, a frontage to a new road on one side, and a footpath called the Old Roman Road on the other. It is within 200 yards of Victoria Park, and not far from Sir George Duckett's Canal. It is about one quarter of a mile from the station of the Eastern Counties Railroad, and three quarters of a mile from Bow Church. Building operations have been going on for some time in the vicinity of the Estate, and as fast as the houses are built they are inhabited. The Chelsea and Bethnal Green omnibuses run 12 times per day as far as the Estate, at 4*d*. fare to the Bank. The allotment of the land is divided into one plot of 1000*l*.; four of 150*l*. each; one of 200*l*.; three of 100*l*. each; three of 90*l*. each; 15 at 75*l* each; and 160 plots of 30*l*. each. For information as to Rights of Choice on the Estate apply to CHARLES LEWIS GRUNEISEN, Secretary.

TO GENTLEMEN GARDENERS.

TO BE LET, with immediate possession, a FLORIST, FRUITERER'S, and GREENGROCER'S BUSINESS, situated by a main road, and in a business neighbourhood, where a good jobbing business might be done, and within five miles of Covent Garden Market.—Apply to S. H., No. 4, Westcroft Place, Hammersmith.

A MOST DESIRABLE FARM.

TO BE LET, THE FARM OF BUDLE, in the Parish of Bamburgh, Northumberland, containing 602 Acres or thereabouts, Tithe free, for such a Term of Years as may be agreed on, with or without an excellent and commodious Mansion House, and good Gardens, and with Budle Harbour from which dues are received, and also Granaries. It is pleasantly situated in the richest part of the County:—the Tillage Land and part of the Old Grass are of superior quality, there is also a portion of useful Sea-side Grass Land. Lime of the best quality may be burned at a small cost on the Farm. To an Independent Gentleman, wishing to farm, the above is highly desirable, the House being pleasantly situated within a short distance of Belford Station and Bamburgh Church; more or less Shooting can also be had.

Offers will be received till January 18th, 1155, by G. A. GREY, Esq., of Milfield Hill, Wooler, from whom further information may be had. A plan will be found with Mr. JOHN BROWN, Gardener, who will show the Farm.—Milfield Hill, Dec. 18, 1854.

TO BE LET, A PLOT OF LAND, with excellent facilities and advantages for converting into Nursery Grounds, enclosed with long brick walls, part well planted with trees. Beautiful water for Horticultural purposes can be had; also Meadow Land with Farm Buildings. and a good residence fronting the high road. Situate near a first-class railway station in Herts—the county of Roses and Orchids.—Apply, if by letter, post paid, to J. HINDMARSH, 7, Jewin Crescent, London.

TO GARDENERS, FLORISTS, NURSERYMEN & OTHERS.

TO BE LET, on Lease or otherwise, and entered upon at Lady-Day next, a PARCEL of LAND, containing about nine acres, adjoining the Railway Station, Atherstone, Warwickshire, situated in the Township of Whittington, in the parish of Grendon, and having thereon a LARGE SPAN ROOF PROPAGATING HOUSE, 104 feet long by 34 feet broad; and also a SPAN ROOF VINERY. planted with well-selected Vines, over five comfortable COTTAGES and OTHER BUILDINGS on the ground floor, being 121 feet long by 21 feet broad. The Land is bounded on the one side by a constantly running brook, into one part of which the sewage of a part of the town of Atherstone discharges itself, and when required is conveyed by pipes to the propagating house. The situation presents a desirable opportunity to a scientific and well informed Gardener, the communication being easy with London, Liverpool, and all the provincial towns. The price of coals moderate, and which are within a very short distance. If desired the buildings will be let with a part only of the Land.—Applications to be made to the Rev. EDWARD POWER, Grammar School, Atherstone, or to Mr. JOHN BAKER, Land Agent, &c., of the same place.—Atherstone, Jan. 1855.

TO BE SOLD, at about half-price, a PATENT CONSERVATORY—a Great Bargain—on account of making alterations; now standing in front of E. Dench's Patent Hothouse Works, King's Road, Chelsea.

MR. JOHN FAIRLIE, Cheveley Park, Newmarket, is prepared to supply EGGS from his various Stocks of Prize Poultry, at 15s. per Dozen, including Box.

DORKINGS.—A few BIRDS from the stock of an Amateur, whose Birds have this year taken prizes at Lincoln, Nelson, Birmingham, Kendal and Manchester.—Also during the season, a few SETTINGS of EGGS from the Prize Birds, at 10*s*. 6*d*. per dozen, including package.—Apply to R. ATKINSON, Singleton Park, Kendal.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. FOX's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

Sales by Auction.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 16th January, at 12 o'clock precisely, DORKING FOWLS, of the choicest quality, which have taken prizes at Colchester, Bury, Winchester, Surrey Gardens, &c., &c., from the yards of T. Dutton, Esq., of Streatham, and the Rev. F. Thursby, of Abingdon; Pure Aylesbury Ducks, White Embden Geese, Coloured and White Dorkings and Brahmas, from Mr. W. K. Breavington, of Hounslow; and many capital Cochins, Spangled Hamburghs, Polands, and Bantams, from Mr. Eason, Mrs. Fookes, and others.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

COCHIN CHINA FOWLS.

MR. J. C. STEVENS begs to notify that he has received instructions from Thomas Sturgeon, Esq., of Grays, to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 23d January, at 12 o'clock precisely, a selection of COCHIN CHINA FOWLS consisting entirely of first-class birds. *** This is the only old and known strain of Buffs now in the hands of the original breeder. Mr. Sturgeon has bred them with rare care and judgment for many years, no second-rate bird has been bred from, and they are unrivalled in their combination of form, size, and colour. Up to 1852 they were the winners of all the best prizes at Birmingham, Cheltenham, Winchester, &c., and were never beaten, since which they have not been shown till within the last few weeks, when they took the Silver Vase and 1st Prize at Manchester.—May be viewed the morning of sale, Catalogues, by enclosing a stamped directed envelope, to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

CONSIGNMENT FROM GHENT FOR ABSOLUTE SALE.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mons. A. Van Geert, of Ghent, to sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, January 26th, 1855, at 12 o'clock, about 500 fine Double Camellias, and 500 Indian and Ghent Azaleas, consisting of all the approved kinds, well set with bloom buds; also new Ghent hardy free-blooming Rhododendrons, of the finest colours, from the deepest red to the purest white; about 400 Standard Roses, including all the leading kinds; with four magnificent Sweet Bays, &c.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

BROMPTON PARK NURSERY.

TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to an unreserved Sale by Auction, on the premises, the Brompton Park Nursery, Brompton, near the "Hoop and Toy," on MONDAY, January 22d, at 11 o'clock, by order of the Royal Commissioners for the Exhibition of 1851, in consequence of the land being required for the formation of new roads, a portion of the valuable Stock growing on the above celebrated Nursery, consisting of FRUIT TREES and EVERGREENS, comprising Standard and Dwarf trained and untrained Apple, Pear, Plum, Peach, Nectarine, Apricot, Cherry, a quantity of Vines, Clematis, and Ivies in pots, Rhubarb, &c.—May be viewed three days prior to the Sale. Catalogues may be had of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

LAND DRAINAGE.

MR. BAILEY DENTON'S TABLES OF COST &c., price 1*s*. 4*d*. Sold by METCHIM, Parliament Street.

MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l*. 10*s*. Sold by JONES & Co., High Holborn, London.

Now ready, price One Shilling,

G. COX, 18, King Street, Covent Garden, and all Booksellers.

PEACE OR WAR?

SEE THIS QUESTION ANSWERED IN

ZADKIEL'S ALMANAC FOR 1855, price 6*d*.; the 42d thousand now on Sale.

N.B. The Companion to Zadkiel's Almanac for 1855, with a Portrait of the Author, price 6*d*.; published by PIPER & Co., 23, Paternoster Row.

GEORGE MILLS' TREATISE ON THE CULTURE OF THE CUCUMBER, MELON, SEAKALE, AND ASPARAGUS, will be sent free by post on the receipt of 3*s*. 6*d*. in postage stamps.

"The details are given with accuracy, and the language used is clear and intelligible to all; a person ignorant of gardening may grow either Melons or Cucumbers with the assistance of Mr. Mills' Book."—*Part of Dr. Lindley's Review.*

GEORGE MILLS, Uxbridge Road, Ealing, Middlesex.

GEORGE MILLS' TREATISE ON THE CULTURE OF THE PINE will be sent free by post on the receipt of 2*s*. 6*d*. in postage stamps.

"There is no mystery here, no preposterous mixture of all manner of unmentionable substances called a compost; no crotchety schemes for rendering the building dear or unmanageable; no ignorant recommendation of operations to which reason in the first instance and experience afterwards are alike opposed. The foundation of the author's success is common sense."—*Part of Dr. Lindley's Review.*

GEORGE MILLS, Uxbridge Road, Ealing, Middlesex.

L'ILLUSTRATION HORTICOLE; Published by A. VERSCHAFFELT, NURSERYMAN, Ghent (Belgium).

A. VERSCHAFFELT begs to announce that *the First Number of the Second Volume* of his work is just out, and contains:—

Sonerila Margaritacea	Fuchsia Queen Victoria
Achimenes Ambroise Verschaffelt	" Prince Albert
	" Mrs. Story
Tydæa Warscewiczi	Maximiliana Regia

L'ILLUSTRATION HORTICOLE can be obtained and is to be seen at Mr. R. SILBERRAD'S, 5, Harp Lane, Great Tower Street, London. *Price Twelve Shillings a Year.*

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1855, *with Newspaper Stamp to go Free by Post, is now published.*

The proprietors of this well-known Publication have endeavoured, in the present edition, to render it even more complete than the last; and have again obtained the valuable assistance of Mr. Robert Errington, Gardener to Sir P. Egerton, Oulton Park, who is acknowledged to be one of the best practical writers on Horticulture of the day.

It will contain a very valuable descriptive list of KITCHEN GARDEN SEEDS, with prices affixed to every article, and in addition to the descriptions, there will be short and concise cultural remarks for every kind of Vegetable, pointing out the best varieties for early, medium, and general crops.

The List of FLOWER SEEDS has been much improved, and contains descriptions of all the leading sorts, with directions for sowing seeds, and other useful practical remarks; and in this department Mr. Errington has written expressly for the work an original article on ANNUAL AND OTHER FLOWER SEEDS, which will be read with much interest.

The CALENDAR OF OPERATIONS for the whole of the year has also been revised, and will be found even more useful than the one in the last edition.

There will be a good Garden ALMANACK as usual, and the detailed quantities of seeds contained in their useful COLLECTIONS OF SEEDS are given in full.

A valuable report of the experiments in their TRIAL GROUNDS is also given, and descriptions of the NEWLY INVENTED CLOCHE, or Hand Glass, and of the new CHINESE POTATO (DIOSCOREA BATATAS). The following original articles have also been written expressly by Mr. Errington—on VEGETABLE FORCING, LIGHT AND AIR, LIQUID MANURE, and ROTATION OF CROPS. And in addition to the above, the proprietors have been favoured with an original paper by J. B. Lawes, Esq., of Rothamstead Park:—"ON THE ARTIFICIAL MANURES MOST SUITABLE FOR THE GROWTH OF BARLEY."

At the request of several correspondents the Publishers have printed the present Edition the size of the "Gardeners' Chronicle," so that those who wish it can bind it with the present volume of that valuable Paper. It contains 32 folio Pages, "Chronicle" size.

Copies can be procured, price 6*d*. each, or free to purchasers of seeds; and can be obtained through the medium of any bookseller in the United Kingdom, from the

LONDON PUBLISHING OFFICE, 294, STRAND;

Or from the Proprietors WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM'S NEW PATENT FOR STABLE REQUISITES.

COTTAM AND HALLEN, the original projectors of the above arrangement of MANGER, RACK, and WATER-TROUGH, as one Fixture, which obtained the Great Exhibition Prize Medal, and universally approved of, have added all the latest improvements to their invention (secured by patent), which includes an entirely new method of attaching the halter, ball, and rein, giving to the horse greater freedom, and being noiseless in their operation, add much to its comfort whilst feeding and convenience when at rest.

COTTAM'S ENAMELLED MANGERS

are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable and impervious to infection; manufactured PLAIN, GALVANISED, or ENAMELLED.

IMPROVED PUMPS,

OF THE BEST WORKMANSHIP AND WARRANTED.

The VALVES and SUCKERS of these Pumps are constructed upon an entirely new and SIMPLE principle; they are not likely to get out of order; should they do so, can easily be repaired, as the Pump is so contrived that the valves can readily be got at.

An Improved CAST IRON TRAP, strongly recommended by the Sanitary Commissioners, and suitable for Sugar Bakers, Slaughter Houses, &c. &c. It is so formed that the Trap-plate will pass any matter the top grating will let through, and therefore is not liable to stoppages; and well adapted to Stables and Stable-yards, for saving the best part of Liquid Manure.

Improved Stable Guttering, with moveable safety covers, Sanitary Traps, Stable Pumps, Double Corner Mangers, Harness-room Appendages, and every article in Stable Furniture. Chaff Cutters and Oat Bruisers, kept on show.

A STALL fitted up, complete, exhibited at the Crystal Palace, Sydenham, Stand No. 19, Agricultural Department; and at

COTTAM & HALLEN'S WORKS, 2, Winsley Street, Oxford Street, London.

WARMING AND VENTILATING.—Descriptive Catalogues and Estimates on application.

LAURELS FOR THE MILLION.

DAVID FERGUSON, Landscape Gardener and Contracting Planter,

INFORMS the public that he grows a LARGE STOCK of TREES and SHRUBS for the purpose of enabling him to CHARGE LOW, and give at once PRESENT EFFECT, when carrying out his plans, which is of consequence to those who prefer having the BENEFIT of Shady Walks, Glades, and Recesses of their own planting, in place of the mixed MILK and WATER SYSTEM of planting frequently met with for the benefit of GRANDCHILDREN.

As D. F. has MORE LAURELS than would crown the Heads of all the HEROES and COWARDS in EUROPE, he will be happy to part with them on LOW TERMS for CASH; also NEW DOUBLE PINK and SINGLE CRIMSON THORNS, YEWS, PORTUGAL LAURELS, BERBERIS AQUIFOLIUM, &c., &c. AUCUBAS, CEDRUS DEODARA, Standard and Dwarf Budded GEANT DES BATAILLES, and other ROSES, &c. If the LAURELS are taken by the Ten, Twenty, Fifty, or ONE HUNDRED THOUSAND, they will be sold at a price that will soon SAVE THEIR COST IN LABOUR. My Plan is to lay them in very close together as under cover, giving at once a good ground outline, and something for the eye to repose on, in place of the HOEING, SCRAPING, AND ALWAYS WANTING UNSATISFACTORY SYSTEM generally practised.

Plans of Houses and Pits, &c., furnished on the Dutch and English Systems. Plans and Estimates Furnished.

D. F. will feel much pleasure in recommending a worthy gardener to any Lady or Gentleman in want of one.—Stowe, Buckingham.

SUTTON'S PRICED SEED AND PLANT LIST, WITH INSTRUCTIONS ON CULTIVATION, CALENDAR OF OPERATIONS, and other Useful Information is now published, price Sixpence: and being entered at Stationers' Hall is copyright.

As this publication is compiled principally for the use of Messrs. SUTTON'S CUSTOMERS, it is requested that those who have not yet received it will forward their Address, when a copy will be sent gratis, and post free. Other persons will receive it post free in return for six postage or receipt stamps.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

EXOTIC NURSERY, CHELSEA.

JAMES VEITCH, JUN., will be happy to forward his new Retail VEGETABLE, AGRICULTURAL, AND FLOWER SEED LISTS on application, and desires to assure those who may kindly favour him with their orders, that he has spared no pains in procuring his supplies from the first growers on the Continent as well as in this country, and that he will use his best endeavours to give his customers entire satisfaction.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

RHODODENDRONS.

J. R. AND A. PEARSON will send eight of the following for 25s., including package.

1. Album elegans, white
2. Blandyanum, dark crimson
3. Coriacea, white
4. Caucasicum pictum, rose spotted
5. Catawbiense alba
6. Eversestianum, rosy lilac
7. Elizabeth, white claret spots
8. Jacksoni, crimson spotted
9. Leopardi, purple dark spots
10. Towardi, bright rose
11. Victoria, Pince's, crimson purple
12. Venus, pale blush

The above are some of the best in cultivation. A descriptive list sent on application.—Chilwell Nurseries, near Nottingham.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON, having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high,	and 8 feet in circumference...		63s.	0d.	each.
8	"	and 4 to 5 feet	"	... 21	0	"
7 to 8	"	and 4 feet	"	... 15	0	"
6 to 7	"	and 3 to 4 feet	"	... 10	6	"
6	"	and 3 feet	"	... 7	6	"

Handsome smaller specimens at proportionately lower prices. Kingston, Surrey.

LYNCH'S STAR OF THE WEST CUCUMBER, *the best frame variety in cultivation. For description, see* RENDLE'S "*Price Current and Garden Directory*" *for* 1854.

Price 1s. 6d. and 2s. 6d. per packet.—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

RANUNCULUSES, ANEMONES, LILIUM LANCIFOLIUM CALOCHORTUS LUTEUS, CALLIPRORA FLAVA, GLADIOLUS, TRITONEA AUREA, DIELYTRA SPECTABILIS, VALLOTA PURPUREA, ANOMATHECA CRUENTA, AND AURICULAS

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY, begs to say that he has a fine Selection of the above BULBS, &c., which he can supply at Moderate Prices. His Catalogue will be forwarded on application.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5s.; 12 varieties, 2s 6d.; and from good double sorts, 1s.

Very superior Quilled German Asters, 12 distinct varieties, separate, 2s., mixed 1s. per packet. Also Choice French Asters, 12 varieties, separate, 3s., mixed, 1s. 6d. Fine Quilled African Marigolds, lemon and orange, 6d. per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6s. per dozen, or 2l. per 100. Double French White, 4s. per dozen, or 30s. per 100.

Saffron Walden Nursery, January 6.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, January 13, 1855.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

SCOTTISH ARBORICULTURAL SOCIETY.—The First General Meeting will be held at the Institution Rooms, 6, York Place, Edinburgh, on WEDNESDAY, 31st January, at One o'clock, p.m., for the Election of Office Bearers, the Reading of Papers, and other Business.

Mr. JAMES BROWN, President, in the Chair.

All interested in the advancement of Arboriculture are invited to attend. JAMES ALEXANDER, Secretary.

Edinburgh, 20th January, 1855.

JAMES LAKE, Nurseryman, Seedsman, and Florist, Bridgewater, begs to return thanks for the very liberal support he has for many years received in the above business, and to inform the Public that the Firm LAKE AND DYER is this day dissolved, and that the business will be henceforth continued by him as heretofore on his own account.

Seed Establishment, No. 3, High Street. Dated Jan. 12, 1855.

CONQUEROR OF THE WEST CUCUMBER.—A Packet containing 12 good seeds of this first-rate Frame Cucumber, which for productiveness is second to none, will be sent, post free, on receipt of 12 postage stamps, addressed to JAMES LAKE, Nurseryman, &c., Bridgewater.

TO BE SOLD, at Prices that will be sure to give satisfaction, 10,000 STRONG CURRANTS of the following sorts, viz.:—Red and White Dutch, common Black and Black Naples, Wilmot's Superb Red, Champaign and Raby Castle. Also a quantity of strong dwarf trained Pears and Plums of the best sorts, Falstoff and other Raspberries, strong standard Pears, and a quantity of prime Seed Potatoes well kept of the best sorts. —For further particulars apply to JAMES LAKE, Nurseryman, Bridgewater.

MANGOLD WURZEL SEED.

TO BE SOLD, LONG RED and YELLOW GLOBE, growth of 1854, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

FRUIT TREES, SURPLUS STOCK.

APPLES, PEARS, PLUMS, CHERRIES, GOOSEBERRIES, & CURRANTS.

TO BE SOLD, at any reasonable offer, for the purpose of clearing some ground, several hundred Pear trees, comprising Winter Nelis, Gracilis, Williams' Bon Chrétien, Hazel, Summer, Portugal, Beurré Capiaumonts, and other varieties. 400 Wellington and Quarrinton Apples, 200 Prince of Wales and Magnum Bonum Plums, 50 Duke Circassian and Morello Cherries. All the above of about 10 years' growth, and coming into full bearing. 10,000 Rifleman Gooseberry Plants, from 1 to 4 years old, and 2000 large Red Grape Currants, 2 years old.

To view, apply to Mr. MITTON, Lampton, 1 mile from either the Isleworth or Hounslow Stations of the South Western Railway.

WANTED, DWARF COMMON MOSS ROSES.—Any party having the above to dispose of can address a line, naming lowest price and quantity, to WM. WOOD & SON, Maresfield. The Plants must be strong and well rooted.

WANTED, OLD WALNUT TREES.—Lowest price, cash, with size, by letter only, to E. S., 41, Fellows Street, South Pearson Street, Kingsland Road, London.

YEWS FOR HEDGES.

EDWARD SANG AND SONS, Kirkaldy, have for sale, at a low price, a large quantity of fine healthy YEWS, once, twice, and three times transplanted, in various sizes, from 12 to 30 inches high.

PEARS, STANDARDS AND DWARF TRAINED.

H. BIGLAND AND CO., NURSERYMEN, Whalley Range, Manchester (in consequence of their giving up the business), have a quantity of the above to dispose of at very reduced prices.

PYRAMIDAL PEAR TREES,

GRAFTED ON THE QUINCE STOCKS.

J. AND J. FRASER have still to offer strong trees of the above PEARS; a Descriptive Catalogue of the sorts may be had on application. To prevent disappointment early orders are requested, as the Stock of some of the varieties is getting low.—The Nurseries, Lea Bridge Road, Essex.

TO THE TRADE.

J. ROY, Jun., SEEDSMAN, Aberdeen, has got to hand a consignment of 35 bales of very superior CUBA BAST. The bales weigh about 1½ cwt. each. Price forwarded on application.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s*. per doz.; HOWARD'S PRINCE ALBERT, 12*s*. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.

Manor Farm, Deptford, Jan. 20.

SUTTON'S SHORT SEED LIST.

SUTTON'S SHORT SEED LIST, *containing only the most desirable sorts, will be sent post free, in return for one penny postage draft or receipt stamp.*

For description and uses, see *Gardeners' Chronicle*, Dec. 30th, 1854, p. 835.—SUTTON & SONS, Seed Growers, Reading.

CHOICE CALCEOLARIAS.

J. COLE begs to offer a few dozen of his unbloomed Seedling HERBACEOUS CALCEOLARIAS from his choice stock; they were the admiration of all who saw them last summer. They are not potted off, though strong enough for large 60-sized pots. The Seed was saved from selected stock, carefully impregnated. J. C. offers them at 4*s*. per dozen, or 25*s*. per hundred. A remittance solicited from unknown correspondents.—Keyfield Nursery, St. Alban's, Herts.

GARAWAY, MAYES, AND CO., having a large Stock of LILIUM GIGANTEUM Seed, can supply full picked seed at 10*s*. 6*d*. per 100.

G. M. and Co. can supply DIOSCOREA BATATAS at the advertised prices. Early application is requested, as the stock is limited.

Catalogues of Kitchen Garden, Flowers, and Agricultural Seeds, may be had on application. Prices if desired. For prices of Cucumber and Melon Seeds see Advertisement of Dec. 30, 1854.

Durdham Down Nurseries, Bristol, Jan. 20.

DIOSCOREA BATATAS—THE NEW CHINESE POTATO.—This new esculent was fully described by Professor Lindley in the *Chronicle* of December 23, 1854.

The Subscribers are now importing a choice lot of Roots, and can supply them on the following terms:—

Four Tubers	£0 10 0	Fifty Tubers	£5 5 0
Ten "	1 2 6	Hundred "	10 0 0

First Orders will have the best Roots.—Apply to

WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

JOSEPH WILSON, SEEDSMAN, Ipswich, offers the following EARLY SEED POTATOES:—The Early Champion Ashleaf seedlings, 12*s*; Jackson's improved Ashleaf, 9*s*.; the celebrated short top Ashleaf, 7*s*. 6*d*.; Nonpariel Kidneys, 6*s*. 6*d*.; Lapstone do., 6*s*. 6*d*.; and the British Queen, 7*s*. 6*d*. per bushel. The whole of the above varieties have been grown especially for seed; they are quite free from disease, and will be guaranteed true stocks; and for quality and yield they cannot be surpassed. Orders to any extent can be executed, free to London and no charge for sacks; and must be accompanied with a remittance.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

Post Office Orders to be made payable at Middleton, Lancashire.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.

To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

REGENT AND JERSEY BLUE POTATOES, of the finest flavour, direct from the grower. Delivered carriage free within three miles of King's Cross Station, at 14*s*. 6*d*. the imperial sack of 224 lbs., for cash on delivery. Choice Seeds from the best growers. Orders executed by C. FLITTON, Factor, 21, York Road, King's Cross.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren very large and firm heads. Price to the trade 24*s*. per lb. smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

DILCOCK'S BRIDE BROCCOLI.

SIXPENCE PER PACKET.

BAINBRIDGE AND HEWISON (Proprietors of this far-famed Broccoli), beg to inform their friends and customers that they are prepared to send it out this season from selected stock of their own growth. The trade can have price on application, and early orders are respectfully solicited.

York Nurseries, Jan. 20.

GOLDEN DROP GREEN FLESH MELON,

SIX SEEDS FOR 1*s*. 6*d*.

WILLIAM WOOD AND SON having received a parcel of Seeds of the above splendid Melon from a party on whom they can confidently rely, have much pleasure in offering it for sale. The following Melons are also highly recommended and may be had post free at 1*s*. per packet:—Golden Perfection, Bromham Hall Green Flesh, Austen's Incomparable, Egyptian Green Flesh, Hybrid Scarlet Flesh, Beechwood True.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.

J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).

CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

JOHN HOLLAND can supply, in strong plants, the heaviest Lancashire Show GOOSEBERRIES (named), of excellent flavour, and large size, at 6*s*. per dozen, on receipt of Post-office order, payable to JOHN HOLLAND, Bradshaw Gardens Middleton, near Manchester.

GODFREY'S BLACK SPINE.

SPLENDID AND PROLIFIC FRAME CUCUMBER.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom; average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2*s*. 6*d*.; 6 ditto, 1*s*. 6*d*.

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1*s*. each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, January 20.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5*s*.; 12 varieties, 2*s* 6*d*.; and from good double sorts, 1*s*.

Very superior Quilled German Asters, 12 distinct varieties separate, 2*s*., mixed 1*s*. per packet. Also Choice French Asters, 12 varieties, separate, 3*s*., mixed, 1*s*. 6*d*. Fine Quilled African Marigolds, lemon and orange, 6*d*. per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6*s*. per dozen, or 2*l*. per 100. Double French White, 4*s*. per dozen, or 30*s*. per 100.

Saffron Walden Nursery, January 20.

SNOW'S SUPERB BROCCOLI.—Every seed new and true. Sealed packet, 1*s*.; per oz., 3*s*.; pound bags for the trade on liberal terms.

GLENNY'S IMPROVED BALSAM.—Unequalled for size, doubleness, and colour; 6 classes, 3*s*.; mixed, 1*s*.; sealed packets with culture.

DOUBLE HOLLYHOCKS from noble flowers. Sealed packet, 1*s*.

Stamps or P.O. orders to GEORGE GLENNY, Horticultural agent, Dungannon House, Fulham. Sales, valuations, &c., attended; Ground Laid Out, Rockwork, Ornamental Water, &c., planned and executed.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties carefully selected, including the new varieties sent out last autumn Strong established plants, in 4-inch pots, at 4*s*. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s*. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s*. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

TWO NEW CUCUMBERS—"SIR COLIN CAMPBELL" AND "GENERAL CANROBERT."—For the full Description of the above two unequalled Cucumbers, and the List of EDWARD TILEY'S Collection of Cucumbers and Melons, which have all been thoroughly proved, see Advertisement and Cut in the *Gardeners' Chronicle* of January 13, 1855.

Sir Colin Campbell	... ...	3*s*. 6*d*. per packet.
General Canrobert	... ...	3 6 "

A packet of either of the Melons mentioned in the former Advertisement will be given to the Purchaser of the above two Cucumbers. A remittance in cash or penny postage stamps must accompany every order, and the whole or any part (as the case may be) will be immediately forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist 14, Abbey Church Yard, Bath, Somersetshire.

CARTER'S PROLIFIC RASPBERRY.—In consequence of J. CARTER seeing his Raspberry quoted in a Nurseryman's Catalogue, who J. C. has reasons for knowing does not possess the true variety, and wishing to prevent imposition, begs to announce that the undermentioned are the only Nurserymen who have been supplied by J. C., or his agents, Messrs. Hurst & M'Mullen. Should other Nurserymen favour with their orders their names will be added to the list; the stock is very limited. Price may be had on application to Messrs. VEITCH & SON, Exeter; RENDLE & Co., Plymouth; WOOD & SON, Marcstield; Low & Co., Clapton; RIVERS, Sawbridgeworth; PALMER, Annan; TURNER, Slough; APPLEBY, York; DOWLING, Southampton; A. SMITH, Sydnope; FISHER & HOLMES, Sheffield; GEORGE GLENNY, Fulham; URQUHART & SON, Dundee; T. BUNYARD, Maidstone; HURST & M'MULLEN, London; or

JOHN CARTER, JUN., NURSERYMAN, Keighley.

BANKS' NEW SEEDLING FUCHSIAS FOR 1855.

W. J. EPPS begs to state that he has purchased the following Seedling Fuchsias, raised by that celebrated grower, E. BANKS, Esq., of Sholden Lodge, Deal; they were the first selection from his splendid batch of Seedlings of 1854, and have been thoroughly proved. They are distinct, rich, and the greatest advance upon any of the kinds known, and cannot fail to give the highest satisfaction.

CLIMAX.—(named by Mr. BANKS).—Tube stout, sepals very broad reflex, with a pretty curve or half circle, the points of the petals touching the seed vessel; colour, rich velvety crimson—the corolla is very large, of a splendid violet blue and great substance: habit, robust, and blooms particularly free. 7*s.* 6*d.*

FAIRY QUEEN.—Very distinct and striking, immense bloomer, beautiful waxy white tube and sepals, tinged with lemon; long well-proportioned flower; corolla large, and of a very rich plum colour puce. 7*s.* 6*d.*

GRAND SULTAN.—A very noble flower, and will be many years before it is equalled; beautiful foliage, and first-rate for exhibiting; flowers large, very stout, sepals reflex, similar to the Turn Cap Lily, and of a very rich crimson colour; corolla large, and very dark velvety purple. 7*s.* 6*d.*

MAID OF KENT.—This Fuchsia is pronounced by the following judges, viz., Mr. Edwards, Secretary to the Floricultural Society; Mr. Barnes, of Camden Nursery; Mr. Todd, of Sutton, to be the prettiest and most distinct Fuchsia yet raised; habit, dense and bushy, producing great clusters of pretty reflexed blooms, of great substance, very clear waxy white, with a rich plum-coloured puce corolla, and exceedingly striking. 10*s.* 6*d.*

BEAUTY OF THE BOWER.—A very rich and perfect formed flower, scarlet tube and sepals, which reflex over the tube, displaying a beautiful dark purple corolla of great substance: habit, perfect. 7*s.* 6*d.*

OMER PACHA.—A large and well-proportioned flower, with dark crimson tube and sepals: corolla, intensely dark velvety purple: habit, excellent and very graceful. 7*s.* 6*d.*

The Set will be sent out in April.—Strong Plants, at 42*s.*

The usual discount to the Trade where three of each are taken.

Agent:—HURST and M'MULLEN, Seed Merchants, Leadenhall Street, London.—Bower Nurseries, Maidstone.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out plants in April next of their NEW SEEDLING FUCHSIAS WITH WHITE COROLLAS, BOTH DOUBLE AND SINGLE, also TWO STRIPED OR VARIEGATED COROLLA'D FUCHSIAS, and TWO UNIQUE FUCHSIAS with VIOLET AND BLUE COROLLAS. The last two were purchased of E. Banks, Esq., after having been flowered, the second season, and proved as flowers possessing unquestionable merits, and unequalled by other red varieties previously sent out. All the other varieties were purchased of W. Story, Esq., of Newton, in the county of Devon, who succeeded in introducing a Scarlet Fuchsia with White Corolla, which new feature in this tribe gives one of the greatest novelties that they have had the pleasure of seeing for many years. Mr. Story, being the raiser of this new Class, offered them to Messrs. Henderson for ONE HUNDRED GUINEAS, which offer they accepted. A faithful drawing of three of the varieties here offered has been taken by Mr. James Andrews, the well-known floricultural and horticultural artist; sketches from which have appeared in Van Houtte's "Flore des Serres," Verschaffelt's "Illustration Horticole," and will also appear in Turner's "Florist," for February. The dwarf, compact, and free flowering habits of the plants will be sure to please every grower of this tribe.

QUEEN VICTORIA (Story's).—Splendid wide sepals, beautifully reflexed, of a bright scarlet crimson, and a lovely clear white corolla. Price 10*s.* 6*d.*

PRINCE ALBERT (Banks's).—Scarlet crimson sepals reflexed, and rich violet corolla. This flower we consider unequalled by any, its reflexing properties being such that either more or less would be a fault; indeed the flower is perfection itself. 10*s.* 6*d.*

MRS. STORY (Story's).—Fine large scarlet tube, long wide sepals reflexed; corolla fine substance, and clear white. 10*s.* 6*d.*

RANUNCULÆFLORA (Story's).—Scarlet sepals and tube, with double white corolla, a flower not having that confused appearance as many of the double varieties are known to possess. This was considered the best of the only two double white varieties flowered by Mr. Story. 21*s.* The other double variety we do not appear to have received.

PERUGINO (Story's).—Fine large scarlet sepals and tube, with a conspicuous striped corolla of rose and purple flakes, handsomely reflexed and free flowering. 10*s.* 6*d.*

EMPRESS EUGENIE (Story's).—Wide reflexed petals of a rosy crimson, the inside of petals having a violet shading; corolla fine white. 10*s.* 6*d.*

RAFFAELLE (Story's).—A beautiful variegated corolla with crimson sepals well reflexed, and of good substance; the colour of the corolla is a rich chocolate flaked with rose, free flowering. 10*s.* 6*d.*

LADY OF THE LAKE (Story's).—Fine deep crimson, with a blush white corolla, very pretty. 10*s.* 6*d.*

WATER NYMPH (Story's).—Bright scarlet crimson globe stout wide petal, corolla fine clear white; an elegant flower. 10*s.* 6*d.*

Or if the set of nine be taken, the price, 4*l.* 4*s.*—January 20.

FUCHSIA (Banks Favourite).—Fine handsome scarlet sepals and tube; large and conspicuous flowers, with sepals finely reflexed; and a splendid blue-violet corolla of great substance. The weak plant being small the number of plants will be limited. Price 10*s.* 6*d.*

MESSRS. E. G. HENDERSON AND SON were surprised to see an advertisement a few weeks back in the *Gardeners' Chronicle*, from Messrs. Lucombe, Pince, and Co., of Exeter, offering two new Fuchsias, similar in character to those described above, and after a written communication with Mr. Story, it was thought necessary for one of the Firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received SEVEN POUNDS for them after (as the said jobbing gardener stated) he had been offered 20*l.* for them by a Nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son think the above explanations necessary, in consequence of a great number of their customers having ordered them at higher prices than are quoted above. This reduction is made in consequence of information which they have received, that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co., are similar in character to the above.—Wellington Nursery, St. John's Wood.

SEED GROWERS' SOCIETY.—The Members of this Society, being at all times desirous to meet any alteration in the markets, are prepared to supply GENUINE SEEDS according to the following scale of prices, comprising Mangold Wurzel, per cwt., Long Red, 40*s.*; Yellow Globe, 45*s.*; Long Yellow, 50*s.*; Red Globe, 50*s.* Carrot, per cwt., Altringham, 9*l.* 9*s.*; Early Scarlet Horn, 9*l.*; James' Green Topped, 8*l.* 8*s.*; Long Surrey, 7*l.*; White Belgian, 6*l.* 10*s.*; Yellow Belgian, 6*l.* Swedes, 55*s.* per bushel; other Turnips, 22*s.* to 30*s.* per bushel. Scarlet Runners, 24*s.* per bushel. Mignonette, per lb., 1*s.* 9*d.*; Giant do., 1*s.* 6*d.* Lettuces, per lb., Drumhead, 6*s.*; Bath Cos, 6*s.*; Brown Dutch, 3*s.* 6*d.* Other Lettuces, Cabbages, Broccoli, Parsnips, Beet, Celery, &c., and Flower Seeds, a list of which may be had by applying to the Secretary, Feering, Kelvedon, Essex. By order, JOHN MOSS, Jun., Secretary.

R. PARKER begs to offer the following CHOICE SEEDS, all of which are warranted new and true to name:

GODFREY'S (BLACK SPINE) CUCUMBER, the finest variety in cultivation, packets containing 12 seeds 1*s.* 6*d.*

Also the following esteemed varieties of CUCUMBERS and MELONS, in packets containing 12 seeds, at 1*s.* each:—

CUCUMBERS.	MELONS.
Henderson's Black Spine.	Victory of Bath.
Improved Patrick.	Beechwood.
Walker's Long Rambler.	Bromham Hall.
Manchester Prize.	Canteloupe.
Hunter's Prolific.	Duke of Bedford.
Superlative Improved.	Golden Perfection (extra fine).
Cuthill's Black Spine.	Scarlet Flesh (Anderson's).

Ohio Squasha Custard Gourd, 6*d.* ... ... per packet.
Antirrhinum, from named flowers, 6*d.* ... "
Calceolaria, from fine varieties, 1*s.* 6*d.* and 2*s.* 6*d.* "
Hollyhock, from fine named varieties, 1*s.* 6*d.* and 2*s.* 6*d.* "
Lilium giganteum, the most distinct and noble species of the genus, packets containing 20 seeds, 2*s.* 6*d.*

*** A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

SELECT PEAR TREES.—The following extract from the "Miniature Fruit Garden" is a list of 24 fine varieties of PEARS that succeed well on the Quince Stock, and form handsome pyramids and bushes, ripening in succession from July till April and May.

Pears for Pyramids, 2*s.* each.

Doyenné d'Eté	Beurré Sterkman
Colmar d'Eté	Zephirin Gregoire
Baronne de Mello	Winter Nelis
Louise Bonne of Jersey	Bergamotte d'Esperen
Alexandre Lambré	Beurré d'Anjou
Beurré d'Aremberg	Prevost

The above form very handsome pyramids, they have been carefully pinched in, so that they are well furnished with young branches down their stems, most of them have blossom buds, and will bear this season.

Pears for bushes, 2*s.* each.

Alexandre Bivort	Melon de Namur
Beurré d'Amanlis	Onondaga
" Diel	Nouveau Poiteau
" Langelier	Grosse Calebasse (C. Carafou)
" Wetteren	Doyenné Boussoch
Maréchal de la Cour	Rousselon (Esperen)

The above nearly all bear large fruit, and when grown as bushes are well adapted for gardens exposed to the wind; they bear profusely and require scarcely any care in pruning; the trees offered are mostly full of blossom buds, and will bear this season. A Descriptive Catalogue of Fruits sent for four stamps, the cost of postage. Carriage paid to London.

THOMAS RIVERS, Nurseries, Sawbridgeworth.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON, having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high,		and 8 feet in circumference...	63*s.*	0*d.*	each.
8	"	and 4 to 5 feet " ...	21	0	"
7 to 8	"	and 4 feet " ...	15	0	"
6 to 7	"	and 3 to 4 feet " ...	10	6	"
6	"	and 3 feet " ...	7	6	"

Handsome smaller specimens at proportionately lower prices.

Kingston, Surrey.

FRUIT TREES.—SURPLUS STOCK.

WILLIAM JACKSON AND CO., Bedale, Yorkshire, having a portion of their Nursery Ground to clear, beg to offer the following FRUIT TREES of the most useful and approved sorts, strong and well grown, in a bearing state, at annexed cheap rates:—

	Per dozen.—*s.*	*d.*
Apples and Pears, good strong Standards	8	0
Do. do. do., Dwarfs	6	0
Do. do. do., Dwarfs, trained	18*s.* to 24	0
Cherries, good strong Standards	10*s.* to 12	0
Do. do. do., Dwarfs, trained	24*s.* to 30	0
Plums, good strong Standards	9*s.* to 10	0
Do. do. do., Dwarfs trained	24*s.* to 30	0
Apricots, Peaches, and Nectarines, trained	42*s.* to 48	0

A reference or remittance is respectfully solicited from unknown correspondents.—Jan. 20.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" Pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.

Seed Establishment, 181, High Holborn, London.

NEW PEA.

W. J. EPPS, SEED MERCHANT and GROWER, Maidstone, has much pleasure in offering the following Pea, feeling assured it will give the highest satisfaction.

LORD RAGLAN, OR IMPROVED MAMMOTH.

This Pea was selected from Hair's dwarf Mammoth two years since, and is unquestionably the best and finest in cultivation, and will prove to be the standard Pea of the day. It is a dwarf green wrinkled marrow of very large size, and an immense cropper. Habit dwarf, branching 3 to 4 feet high, producing immense clusters of large bright green pods from the base of the haulm to the top, and similar in shape to the Scimitar, but of greater size, well filled with seven to ten Peas, which are larger than the British Queen, and equal, if not superior in its flavour.

Price, 5*s.* per Quart. Wholesale Prices to be had on application.

Agent: Messrs. HURST and M'MULLEN, Seed Merchants, Leadenhall Street, London.

NEW SORTS OF PEAS.

CARRIAGE FREE, EXCEPT PARCELS UNDER 20*s.* VALUE.

SUTTON AND SONS *have much confidence in recommending the undermentioned* PEAS, *as being not only new and distinct from others, but also as possessing superior properties.*

Prices per peck or bushel may be had on application.

	s.	*d.*
PRIZETAKER.—New, fine long green pods, which hang so closely as almost to cover the haulm from top to bottom. Numerous prizes were awarded to the Prizetaker last summer. This is the first season we have offered it for sale. Height 5 feet	3	
BECK'S EARLY GEM.—New, prolific, and fine flavour; particularly adapted for narrow borders and for small gardens. Height 1½ foot	1	
FAIRBEARD'S NONPAREIL.—New wrinkled marrow-fat, very sweet, juicy, and prolific; 9 or 10 will be found in every pod, and the pods extremely numerous; 4 ft. high	2	

SUTTON & SONS have a large stock of good old kinds at low prices, as see their Priced List, just published.

SUTTON & SONS, Seed Growers, Reading.

DICKSON'S EARLY FAVOURITE PEA (NEW).

FRANCIS AND ARTHUR DICKSON AND SONS, SEED MERCHANTS, &c., Chester, have much satisfaction in introducing the above new Pea, which they believe they are perfectly justified in saying is the best and most prolific Early Pea in cultivation.

It has been tried side by side with all the best early and second early Peas of the day, and has been pronounced by many eminent gardeners who saw it under the circumstances to be much superior to any variety of its season hitherto introduced.

It comes in about a week later than the "Early Emperor" (sown at the same time), grows about 4 feet high, and produces a wonderful profusion of pods, which contains on an average 9 Peas of excellent quality and flavour. It has been grown the last two seasons in the Gardens of the Horticultural Society, and Mr. Thompson, in reporting upon it, writes as follows:—

"Horticultural Society's Gardens, Dec. 20th, 1853.

"In reply to your inquiry respecting DICKSON'S EARLY FAVOURITE PEA, I beg to state that I consider it a *new* and very *desirable* variety. It is very prolific in pods, and also as regards the number of Peas in the pods, and the quality is excellent. It most resembles the 'Auvergne,' but is earlier than that excellent sort, and the pod is not so much hooked. R. THOMPSON."

"Horticultural Society's Gardens, June 28th, 1854.

"I beg to hand you a copy of the memorandum which I made respecting your EARLY FAVOURITE PEA, amongst others, again this season. About four feet high, very prolific; pods long, roundish, slightly curved, containing on an average nine to ten Peas of excellent quality. Bears some resemblance to the 'Auvergne,' but differs in having straighter pods, and it is much earlier than the 'Auvergne.' *An excellent prolific Early Pea.*

"R. THOMPSON."

In July last a dish was sent to the Horticultural Society's Room, London, and Dr. Lindley reports upon it as follows [see *Gardeners' Chronicle* of July 29th, Notice to Correspondents, "F. & A. D. & Sons."] "Having made the necessary inquiries we are able to state that your 'EARLY FAVOURITE PEA' is a distinct and very useful variety among the class of second early to which it belongs. The pods are unusually full."

Price 3*s.* 6*d.* per Quart; per Pint, 2*s.* Messrs. HURST and M'MULLEN, Seedsmen, &c., 6, Leadenhall Street, wholesale London Agents.—N. B. The Trade supplied on liberal terms.—106, Eastgate Street, Chester; (and 14, Corporation Street, Manchester).

Jan. 20.

THE NEW CHINESE POTATO (DIOSCOREA BATATAS).

MR. JOHN HENDERSON has the pleasure of informing the Nobility, Gentry, and Clergy, that the opinions already expressed by him (in the columns of this journal) respecting the excellent qualities of the above new esculent (which he has had the honour of introducing into this country) are fully borne out by the most eminent Horticulturists and Botanists of the day, among whom he may mention Dr. Lindley, Professor Decaisne, of the Museum of Natural History, Paris; M. Louis Vilmorin, the well-known and scientific horticulturist; and M. Pépin, of the Jardin des Plantes, Paris.

Mr. J. HENDERSON also begs to call attention to the leading article in the *Gardeners' Chronicle* of the 13th inst., giving a full description of experiments made last year in order to test the value of this new vegetable; and which proves that in produce it is greater than the ordinary Potato, of hardier growth, and in its eating, cooking, and keeping qualities far its superior.

Tubers, with description of the Chinese mode of culture, to be obtained of Mr. JOHN HENDERSON, Kingskerswell, South Devon, at the following prices for cash:—

Four tubers, 10*s.*; ten do., 1*l.* 2*s.* 6*d.*; fifty do., 5*l.* 5*s.*

Post-office orders are requested to be made payable at Newton Abbott, South Devon.

NEW SEEDLING POTATO—THE CHAMPION KIDNEY.

This Potato bears a great resemblance to that fine old Potato the Ashleaf Kidney; it possesses the following good qualities over the Ashleaf. If planted at the same time it will be ten days earlier, all the sets always vegetate well, and do not die off in the ground as the Ashleaf does: 2 pecks of seed will produce a greater weight of Potatoes than 3 pecks of the Ashleaf. It is quite equal to that in flavour, and is eatable during the whole winter. Sets that have had the shoots broken off five or six times during the spring will vegetate again as if it had been the first shoot. About twenty Gentlemen and Gardeners who had seed to plant last season have assured me that they never before grew any Potato to equal it, and should continue to grow it as a first early Potato. Numerous orders have been already received from persons who saw it growing during the last summer. It has been grown and thoroughly proved for the last four years and found to be less liable to disease than any other Potato that has been grown. Out of 25 sacks grown this season there was not a single diseased Potato among them.

Sold in quantities of not less than 1 peck; they will be sent Hamper and Package free, at 5*s.* 6*d.* per peck, or 4 pecks for 1*l.* hamper free. A remittance in cash must accompany all orders, or small amounts in penny postage stamps. Purchasers would do well to name the nearest railway station to their residence.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST,
14, Abbey Church Yard, Bath, Somerset.

WHEELER AND SON'S
SHORT SELECT SEED LIST.

OUR PRICED LIST OF SEEDS for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers. *We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year;* and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.

J. C. WHEELER & SON, GLOUCESTER.
SEEDSMEN TO THE GLOUCESTERSHIRE AGRICULTURAL SOCIETY.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

TO THE SEED TRADE AND OTHERS.

THE SUBSCRIBER offers the following SEEDS, which have been grown and selected from the best stocks possible. Prices forwarded on application.

BROCCOLI.
Early White
Miller's Dwarf
Brimstone
Chappell's Cream
Imperial White
Dwarf Danish
Dilcock's Bride

CURLED PARSLEY.

PEAS.
Victoria Marrow
Fairbeard's Nonpareil
British Queen
(Very fine samples.)
Lord Raglan

TURNIP.
Laing's Swede (very true)
Red Tankard
Early Stone
Red American Stone
American Strap or Lettuce-leaved Stone.
White Globe
Green Globe

WURZEL.
Long Red
Yellow Globe

CELERY.
Cole's Crystal White
Cole's Red

EPPS, SEED GROWER and MERCHANT, Maidstone.

HOLCUS SACCHARATUS,
OR CHINESE SUGAR CANE.
(See GARDENERS' CHRONICLE, Dec. 30th, 1854.)

MR. JOHN HENDERSON, formerly of the firm of JOHN A. HENDERSON & Co., Pine Apple Place, London, has the honour to announce that he is prepared to supply Gentlemen, Amateurs, and Professionals, with seed of this most valuable and estimable plant.

As the Dioscorea Batatas seems well adapted to make good any deficiency arising from failure in the Potato crops, so this appears admirably calculated to meet many wants of the present day. That it may be used for the purposes of distillation, and may therefore preserve the grain of the country, is not less certain than that the leaf and stem (after the saccharine matter has been extracted) contain a large amount of fibre, of such a nature as can be employed in the manufacture of every kind of paper. In both these points, as well as in many others, this plant demands the attention of every Gardener and Amateur throughout the country; the more so as from the necessity that at present exists for the production of fibres that may be used in paper manufacture a due remuneration may be fairly expected by growers, even after the plant has, so to speak, paid itself by the saccharine matter extracted from it.

Mr. HENDERSON hopes, in a few days, to have ready for the press a more lengthened account of this plant, as well as a complete statement of the latest experiments in connection with the Dioscorea Batatas. As there are many varieties of the Holcus W. J. H. can only be responsible for seed forwarded by himself, which he is prepared to do in sealed packets, at 1s., 2s. 6d., 5s., and 10s., according to quantity.

Orders to be accompanied with a remittance to Mr. JOHN HENDERSON, Kingskerswell, Newton Abbot, South Devon.

P.S. Price to the Trade can be had on application.

SUTTON'S GRASS SEEDS (CARRIAGE FREE).

NATURAL GRASS SEEDS FOR PERMANENT PASTURES, separate or mixed, expressly to suit the soil.—Messrs. SUTTON and SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of the Grasses which thrive in the various soils of Great Britain and Ireland, are enabled to supply the sorts and quantities of Seeds, varied to suit the soil for which they are intended. The cost will vary from **24s.** to **30s.** per acre, according to the sorts and quantities the soil requires.

FINE LAWN GRASS SEEDS, for making New or improving Old Lawns, price **1s.** per pound, 2s. 6d. per gallon, or 20s. per bushel. For forming new Lawns, 2½ bushels, or 50 lbs., is the quantity required per acre.

FINE GRASS AND CLOVER SEEDS FOR IMPROVING OLD PASTURES (SUTTON'S Renovating Mixture). Quantity required per acre, 8 lbs. to 12 lbs. **price 9d.** per lb.

N.B. It will be seen above that we have greatly reduced the prices of our Grass Seeds this season, especially the fine Lawn Seeds and "SUTTON'S Renovating Mixture" for improving Meadows and Pastures; and we doubt not that our liberal charges will induce a more general practice of sowing our superior kinds of Grass Seeds.

SUTTON & SONS, Seed Growers, Reading, Berks.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their Stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out.

Their Seeds may be fully relied on as being in every respect of first-rate quality, and true to their sorts. Catalogues may be had on application.—Pine Apple Place, Edgeware Road, London.

The Gardeners' Chronicle.

SATURDAY, JANUARY 20, 1855.

AT page 835 of the volume for last year some account was given of a so-called "SUGAR CANE," from the North of CHINA (*Holcus saccharatus*), and of experiments made in France with the view of ascertaining its value for the manufacture of sugar. In that article the exaggerated accounts which had appeared respecting it in foreign journals were corrected on the high authority of M. LOUIS VILMORIN, who has paid much attention to the cultivation and properties of the plant in question. In some of the English newspapers erroneous statements have also appeared, and so recently that they are probably even now in circulation. According to some of these, the plant yields 80 per cent. of sugar; whereas that is only the amount of juice which may be obtained, the greater part of which is water. The nature and proportions of the substances that the plant contains will, however, be best understood from an analysis which has recently been made, the results of which are as follows:—

	Per cent.
Water	63.88
Sugar, crystallisable and not crystallisable ...	18.64
Nitrogenous substances	1.06
Resinous, fatty and colouring matters ...	0.50
Woody fibre	15.41
Salts soluble in water (sulphates and chlorides)	0.27
Insoluble salts (of lime and oxide of iron) ...	0.23
Silica	0.01
	100.00

The above analysis was made from the middle portion of a stem: but, in consequence of the plants having been injured by carriage, it was found impossible to separate the crystallisable part of the sugar from the uncrystallisable. At all events, it appears that the richness of the plant in sugar is very remarkable.

The juice of the Holcus furnishes, M. VILMORIN observes, three important products:—Sugar, alcohol, and a fermented liquor analogous to cider. When the juice is obtained from peeled canes it is almost colourless, and may be said to consist of merely sugar and water. Its density varies from 1.050 to 1.075, and the proportion of its sugar from 10 to 16 per cent. Sometimes, however, as much as a third of the total amount of sugar is not crystallisable, and to this circumstance is attributed the facility with which the juice enters into fermentation, and the large amount of alcohol it affords compared with the quantity of sugar directly indicated by the saccharometer. From this it appears that the saccharine matter of the plant cannot be rendered wholly available in the sugar manufactory; for about one-third of it is lost. On the other hand, the state in which that one-third exists is considered the most favourable for the distiller, and for preparing a fermented liquor resembling cider. It is not expected that the Holcus can compete with Beet as regards marketable sugar produce in the north and middle of France; but in the south of France and Algeria, or indeed in any region between where the Sugar Cane ceases to thrive and the 44th degree of latitude, the Holcus may be profitably cultivated for sugar. Elsewhere M. VILMORIN concludes, from the results of his experiments, that it will be most advantageously cultivated for its alcoholic products. Its value in this respect may be estimated by the result of some experiments which he has made.

He obtained from stems, from which the peel had been stripped, at the rate of from 55 to 60 per cent. of juice. The upper joints and spikes were only cut off; but by cutting off more, and subjecting the stems to a better process of crushing, he thinks that 70 per cent. of juice could be obtained. The quantity of stems employed, large and small together, was 553 lbs., which gave 23 gallons of juice, of the density of 1.052; and as the pressing was done in a common cider press, he estimated that upwards of 3 gallons were lost in moistening the large surfaces of the apparatus. The proportion of sugar which the juice contained, as indicated by the saccharometer, was as follows, from plants grown at Verrières, and taken at different periods:—

SUGAR.

October 23d, 1853	...	10.04	per cent. of juice
Nov. 18th, 1853	...	13.08	" "
2d trial ...	...	14.06	" "
October 13th, 1854	...	10.14	" "
Nov. 14th, 1854	...	16	" " ; of which 11¾ were crystallisable, and 4¼ not crystallisable.

The quantity of pure alcohol was determined by the direct mode of fermentation, and the amounts are given in the order in which they were ascertained.

Juice from plants grown at Verrières:—

Sept 28th, 1854	...	4.1 per cent. of pure alcohol.
Oct. 4th, 1854	...	5.4 ditto ditto.

Juice from plants grown in Algeria:—

FIRST FERMENTATION, OCT. 17TH, 1854.

Second trial ...	7.0	by SALLERON'S apparatus.
	7.4	
	7.0 to 7.2	by distillation.

SECOND FERMENTATION, OCT. 18TH, 1854, 7.952 PER CENT.

Juice from plants grown at Verrières:—

Oct. 20	7.251	by distillation.
Nov. 16	6.326	panicles cut.
Nov. 17	6.467	panicles not cut.

Omitting the results of the trial made on the 28th of September, when the plants were evidently too young, and those with plants grown in Algeria, it appears that the average quantity of alcohol for the climate of Paris is about 6.3 per cent., or at the rate of $6\frac{3}{10}$ gallons of pure alcohol from 100 gallons of juice.

This per centage is considered very satisfactory, especially M. VILMORIN observes, when the excellent quality of the spirit is taken into account. The best idea of the value of the plant will, however, be obtained by calculating from the results of the experiments the produce per acre, according to which the yield is as follows:—

Stems and leaves	68,938 lbs., or upwards of 30 tons.
Stems only ...	43,984 " " 19 "
Juice, at 55 per cent. of weight of stems	2415 gallons.
Sugar calculated at 8 per cent. of juice	1935 lbs.
Pure alcohol, at 63 per cent. of juice	182 gallons.

For comparison with the above, the average produce of Beet-root is per acre:—

Roots	40,147 lbs., or nearly 18 tons.
Juice, at 80 per cent. of weight of roots ...	32,118 lbs., or upwards of 14 tons.
Sugar at 6 per cent. of juice	1927 lbs.
Pure alcohol, at 3 per cent. of Beet	120 gallons.

It will be observed that the quantity of sugar from the Holcus is estimated higher than that from the Beet-root; but the small difference would not compensate for the extra labour required for preparing the canes, and for the greater difficulty in extracting. The quantity of spirit, however, far exceeds that

derived from Beet-root, the difference being upwards of 60 gallons on the produce of an acre.

A liquor resembling cider can also be made from the Holcus, and is said to be very good when properly prepared. The quantity of juice, according to the above figures, would be 1207 gallons from the produce of an acre. For making this liquor, the canes require to be either exposed to the sun for several days, in order to concentrate the juices by evaporation, or to be placed in a slow oven; or the juice after being pressed out must be boiled down to the required density, along with about 7 oz. of fresh Oak chips for every 22 gallons of juice. The juice readily ferments with the addition of a little yeast, or with a bunch of Grapes squeezed into it.

These statements, which are entirely taken from M. LOUIS VILMORIN'S ample reports, appear to show that the Holcus may be profitably grown in this country for distillation, provided the Excise makes no objection. But we learn from Mr. JOHN HENDERSON that the refuse, which has not been at all considered in France, consists to a very great extent of excellent fibre easily extracted and easily bleached. We have ourselves ascertained that such a fibre is worth at least 10*l.* a ton to the paper makers, and probably half as much more. This very important fact seems to remove all doubt as to the value of the Holcus to cultivators.

It may, indeed, be an exhausting plant, like Maize and other white crops; but deep cultivation will meet this difficulty, if it be one, and at all events the value of its sugar and its fibre, taken together, ought to leave a handsome profit, even although an unusual quantity of manure should be necessary to replace what it may take out of the ground, supposing always, that the refuse left after distillation and the extraction of its fibre should not of itself represent as much as the crop has taken off.

For further information upon this interesting subject, the reader is referred to M. LOUIS VILMORIN'S report in the new volume of the *Bon Jardinier*, and to a detailed account of the Holcus cultivation which we understand Mr. HENDERSON is about to publish.

THE *Dorset Reporter* contains the following statement, entirely confirming the opinions we have always expressed concerning the CRIMEAN CLIMATE; as does all the intelligence received in this country from the seat of war up to the present time. The information was furnished by Mr. JAMES SINCLAIR who from 1838 to 1852 resided in the Crimea, as gardener to Prince WORONZOW, and may therefore be relied upon. He says:—"The open-air calendar of gardening for that, the south coast of the Crimea, with the exception of some few sowings in April, would suit to a nicety the whole south coast of England, from Cardigan to Harwich. If you place Eupatoria in Cardigan Bay; contract the Bristol Channel to the dimensions of the inlet before Sebastopol, and put Torquay at the head of the bay, to represent Inkermann; make the Land's End, Cape Khersonese, and the Isle of Wight, Balaklava, and so on down to Harwich, which represents Kaffa; then add our south-coast climate to that of the Crimea, and we are not far short of the mark. The winters are just as variable in the Crimea as they are in London or Edinburgh, but not so long. The summers are much warmer and longer than with us; the spring is earlier and the autumn is later there than here. Occasionally, but at long intervals, the frost is harder there than in England, by a few degrees, but does not last so long: for several winters in succession the snow never lies long on the coast, and the same kinds of plants do not require the same amount of protection in hard winters there as they do on the coast of Devonshire, because they ripen better by the hot summers in this part of the Crimea. The climate, however, is more relaxing than with us, and low bilious fevers creep on more and more on our people, after the first few years; my friend was seven years in the Crimea before he felt the effects of this climate; but at last he was reluctantly obliged to come home to recruit his strength, 'on leave of absence,' with a promise to return after a year or so, with new and improved breeds of plants and animals. He is now safe, and so will our soldiers be, for anything of a winter they may meet with there."

SOME LEAVES OF ARAUCARIA were lately submitted to us (as noticed in our answers to correspondents, Nov. 18, 1854), affected by some malady which causes a spotted appearance, and materially injures the beauty and symmetry of the leaves, on which the ornamental effect of the tree depends. The disease was evidently independent of the growth of parasites, though a minute fungus had been developed after incipient decay. The remarkable tendency exhibited of late in many parts of Germany by Conifers to cast their leaves prematurely, was at first supposed by GÖPPERT to arise from Hysterium Pini. But Dr. STEIN has carefully followed up the phases presented by the leaves, and was convinced, like ourselves in the instance of Araucaria, that the parasite was developed after their fall, in which case, and not before, the mycelium was found penetrating the tissues. There is, however, another disease which has been prevalent on the leaves of Conifers, causing them to assume a yellow tint, which has been prevalent since 1831, and which was examined by WALLROTH three years later, in consequence of its extreme prevalence. Two fungi, as WALLROTH supposed, accompanied the malady, which, according to Dr. STEIN'S observations, are really states of one single species. It germinates on the upper surface of the leaves, into which its mycelium soon penetrates, affecting especially the tissue beneath the stomates, and producing a conversion of the Chlorophyll into starch, which either vanishes entirely, or is multiplied to such a degree as to completely gorge the cells, forming large confluent solid masses of fecula. The cell walls soon assume a yellow tint, which passes into brown, and as a consequence the mycelium itself perishes. The yellow tint appears on the leaves in bands or spots of very different sizes, according to the strength and prevalence of the fungus, which belongs to the Cytisporous tribe, whose species are remarkable for naked hyaline spores discharged in the form of gelatinous masses or tendrils. Dr. STEIN does not state what is the exact genus or species to which it belongs; but the elongated constricted spores show that is not the common Cytispora which occurs so frequently on Pine leaves in England.* *M. J. B.*

New Plants.

110. ESCALLONIA PTEROCLADON, *Hooker, Bot. Mag.*, t. 4827.

A plant of this pretty shrub was exhibited some months ago by Messrs. Veitch as an evergreen which might be expected to prove hardy; but we delayed publishing it till more certain information upon that point should have been gained. We now learn from the "Botanical Magazine," where Sir William Hooker

has named it, that it is "a decidedly hardy shrub, 4 to 5 feet high, an abundant bloomer, and fragrant;" recommendations, he observes, for a bushy plant, with leaves like a small-leaved Myrtle, and very pretty almost Epacris-like flowers, white tinged with red. Our own wild specimens, for which we are indebted to Messrs. Veitch, were found by Mr. W. Lobb on the coast of Patagonia, and fully bear out the expectations thus expressed. We thought, indeed, when the live plant was before us, that in beauty of foliage it was quite equal to a Pernettya. It derives its name from certain wavy wings which stand out from the young wood, and of which traces are for a long time visible on the old branches, although they eventually disappear there.

VEGETABLE PATHOLOGY.—No. LV.

245. STERILITY.—*Constitutional and Organic.*—It was stated above (241), that functional sterility is not so completely uncontrollable in the vegetable as in the animal kingdom, because in the latter there is no renewal of the organs which supply the ovules, or by which they are impregnated, whereas in the vegetable world there is a constant reproduction of those parts from a metamorphosis of which the organs of fructification are produced. If, however, the peculiar tendency of the individual or variety be to produce organic change in those parts, we have no means, comparatively speaking, by which we can control that tendency.

246. Sterility may be induced by organic change of various kinds, both in the general envelopes, and the male and female parts of fructification. In the Wheat ear carnation, for instance, the sepals, though retaining to a great extent their natural appearance, are multiplied to such a degree as to prevent the formation even of petals, much more of the interior organs; and similar conditions exist in varieties of many other plants, as in the Sweet William, Foxglove, Lupine, &c. In a few instances the interior organs are more or less perfected, and impregnation may occasionally take place, or a few seeds be matured, but the general effect is comparative sterility. Where such abnormal tendencies exist, even should the pistil be formed and perfect pollen generated, there is often a concurrent tendency in the ovules or ovaries themselves to sport, in consequence of which they frequently afford most favourable opportunities of studying the morphology of the organs, a branch of botany which has so much weight in the elucidation of natural affinity.*

247. The unnatural multiplication of the petals, or any great hypertrophic change in the structure of the sepals may be equally productive of sterility, as is notorious in the varieties of ornamental plants which are due to the skill of the florist. Experience shows that efforts to overcome this sterility for the production of new varieties are seldom successful, the best results arising from those stray seeds which are produced with difficulty by highly metamorphosed flowers. A plump, well nourished seed, is almost sure to give rise to some form entirely worthless to the florist. In such cases artificial efforts are directed, in the first instance, to produce such changes as are conducive to sterility, and then to keep up as much as possible that abnormal condition, both for the preservation of the variety itself and for the production of new forms possessing valuable qualities.

248. The total suppression of the petals is seldom of much consequence. Varieties occur, as for instance in the Sweet William, where not a trace of petal exists and yet every ovary is impregnated; but the contrary condition is not infrequent. In several species of Violet the early petaliferous flowers are often barren, while those which appear later in the season are productive. In Ajùga Iva,† fertile flowers occur indifferently with or without a corolla. In Ononis minutissima, in contradistinction to the Violets, the earlier flowers are apetalous, and equally fertile with the petaliferous flowers which are produced later in the season, and the same equal fertility belongs to both kinds of flowers in Helianthemum,‡ in which genus, Lespedeza, &c. (as mentioned in a note to the translation of Re's treatise), they are generally simultaneous. In some of these cases the stamens seem very imperfect, and I am inclined to think that seeds are often produced in such flowers, as in Celebogyne, without impregnation; a very limited number, however, of pollen grains may sometimes be found, as we are assured by Brongniart, though the great fertility of such flowers, if entirely dependent on impregnation, could scarcely be insured by such a precarious supply, judging at least by the experience afforded by hybridisation of the quantity of pollen necessary for success.

249. Sterility may arise, again, from some malorganisation of the pistil and its component parts, as where the carpels or ovules are transformed into leaves, or where the ovules put on the guise of carpels. In such cases, however, sterility is not always absolute, though the normal tendencies of the fructifying organs may be frustrated, as for instance where a little bud or bulb is formed at the expense of the true fruit, as in proliferous Grasses. In the genus Crinum and some others the seed is apparently replaced by an enormous mass of cellular tissue. Accurate search, however, will detect a perfect embryo in the midst of the tissue, as originally described in Brown's Prodromus.§

250. Though all the parts of a plant may be perfect, and impregnation may take place, and an embryo be formed, the plant may still be sterile from constant abortion. This is especially the case where the walls of the ovary are highly developed, insomuch that in some of the finer varieties of Pears, &c., perfect seed is of comparatively rare occurrence; while, on the contrary, in Grapes attacked by mildew the seeds are in general multiplied. In such cases, as the properties which make the fruit valuable are altogether independent of

---

* We are acquainted with Dr. STEIN'S memoir, which is contained in the "Tharander Jahrbuch," from the notice of it in "Botanische Zeitung," Feb. 17, 1854.

* One or two curious instances have lately been examined, one of which, that of a monstrous Foxglove, has already been reported in this Journal (1854, p. 660), and another of a Sweet William, at present unpublished, which throws much light on the nature of the placentation of the natural order to which it belongs.

† I cultivated this species at Margate two or three years in succession, and never obtained a flower with a corolla, though the seeds were all perfect.

‡ Cistus surrejanus, L., figured in Eng. Bot., t. 2207, is a nearly apetalous form of the common wild Helianthemum.

§ I have been informed by a very accurate botanist and close observer that the seeds of Crinum sometimes appear to germinate indifferently from any point in which they may be placed in contact with the surface of the soil, as if germination in certain cases might take place without the intervention of the embryo or in its absence. The matter is well worth attention. I have no observations of my own to offer on the subject, but I can bear ocular testimony to the fact that it was the habit of the botanist in question to raise seedlings from the large cellular bodies placed merely on the surface of the soil, and not covered with it.

the seed, it is sufficient for the purpose of the cultivator if impregnation have taken place to such an extent as to insure the swelling of the sarcocarp. It is to this abortion that many cases of sterility are due. The process of impregnation is so far successful as to stimulate the contents of the embryo sac, and the fleshy walls of the fruit; but after a time the embryo ceases to grow, and the sarcocarp withers. This is especially the case in stone fruit, as is well known, at least practically, to every cultivator, whose fruit so frequently deceives his hopes just when it is undergoing the process of stoning. Meyen has studied the matter in the case of forced cherries. From a very early stage of growth it could be predicted certainly, in consequence of a change of external form, and sometimes a peculiar intensity of colour, what fruit would ultimately prove abortive. The shrivelling of the embryo takes place, however, previously to the peculiar elongation of the fruit. This happens sometimes before the indication of cotyledons, sometimes at the commencement of their formation, and sometimes when two-thirds of the embryonic sac are occupied by the embryo. The sterility is by no means due to deficient impregnation, but apparently to a greater degree of heat than its growth requires, which stimulates other parts at the expense of the embryo. *M. J. B.*

LOIS-WEEDON CULTIVATION.

I USE the term "double-digging" advisedly, because it is really the only compound word that will suit my case. For what is my practice? At the outset I plough the whole field early in autumn an inch deeper than the staple, harrow, and roll, and harrow again—pulverising and preparing it, in short, as for Barley. I then get in my Wheat, leaving yard-wide fallow intervals between the rows. When the Wheat is up I begin to dig, which is done thus:—At the end of the interval I first throw out on the headland about 3 feet of soil to the entire depth I intend to go the first year, and, supposing the staple to be 6 inches, and the 4 inches of subsoil to be clay, this depth altogether will be 10 inches. The spadesman now, with a shallow spit, casts the 6 inches of staple to the bottom of the trench of this yard length of interval; and then, with another spit still shallower, throws the 4 inches of the subsoil lightly on the top, and so on all over the field. This process is clearly accomplished at two diggings; and so, as I think, may strictly be called "double-digging."

My object in thus keeping the pure subsoil separate and unmingled on the surface, which no single digging to the same depth could do so effectually, is to enable the atmosphere during winter to have its full and unobstructed influence on the clay; and when this effect has been produced, as it will be found to be in spring, these important results will have ensued:—The clay will have crumbled down to dust, a portion of its known mineral constituents will have been rendered soluble, and it will be brought into a condition to receive and retain the organic elements of fertility contained in the atmosphere. It is only after this that the horse-hoe in the summer well mixes the now pulverised clay with a portion of the staple below, and fits the land for the following crop.

In the third and fourth years (the other moiety of the field having gone through a similar process the second year) an inch more of the subsoil is brought to the surface; and so on year after year till a depth be attained by inch degrees, of 20 or 24 inches, "beyond which it is neither needful nor convenient to go." The principle of the practice being that no more of the subsoil be brought to light than can be wholly pulverised before it be mixed with the staple, it is evident that, in the end, after many years of gradual deepening, and repeated stirrings throughout each year, the entire depth of these two full spits will have become friable as garden mould, and therefore easy and inexpensive to dig, the cost of the half acre amounting on an average to the stated sum of 30*s.* or thereabouts.

This explanation, which I very willingly give in reply to your courteous correspondent, is not an after thought, but the same statement runs through the whole of my pamphlet, though in order to avoid prolixity I have not before gone so deeply into detail; and if any one has been misled by the term "double-digging," which I have applied to my own case, it is not owing, I humbly suggest, to any want of warning on my part. For at pp. 10, 24, 29, 49, 53 (last edition), I have spoken on this point with equal decision if not with equal clearness. "In digging the intervals, did I," the operator is to ask himself, "bring up only so much of the subsoil as could be thoroughly pulverised and mellowed for the succeeding crop; of clay only a few inches; of any subsoil, just so much as would lose its rawness during the twelve months' fallow?" (10.) "I have just sent in my spadesmen to trench the fallow intervals two shallow spits deep." (24.) "At the commencement of my trenching a field, I bring up only so much of the subsoil, say 4, 5, or 6 inches, as can be penetrated by the atmosphere and prepared for use by the one year's fallow, increasing the quantity year after year, till the staple has become two good spits deep. And when all has once been loosened in this way and become light, the calculations I have quoted may, I think, be considered correct." (29.) "By means of the deep-stirring up-lifting fork, in lieu of the glazing and level plough, I bring up these mineral treasures, inch by inch, to be disintegrated and decomposed by summer fallow, exposing them gradually, year after year, till I reach the limited depth of 2 feet, beyond which it is neither needful nor convenient to go." (49.) And, finally, in the directions for cultivation, "The plant being now distinctly visible, dig the intervals two spits deep; increasing the depth year after year till they come to 20 or 24 inches. Bring up at first only 4, or 5, or 6 inches, according to the nature of the subsoil, whether tenacious or loamy or light. To bring up more at the outset would be a wasteful and injurious expense." (53.)

In my own case, experience has combined with theory and science in showing the extreme advantage, in productiveness as well as outlay, of this accuracy of cultivation over the ordinary method of double-digging; for, 10 years ago, a portion of my clay field, devoted to root and green crops, was, by oversight, double dug two full spits deep at the outset, and this has been the result: it still remains heavy and impracticable, and does not appear likely to recover for years; the clay clods, mingled with the staple, come only partially under the influence of the frost and wind and rain, and make me mourn over the unintended disregard of my own rule. *S. Smith, Lois-Weedon, Jan.* 16. [It is quite evident that the term "double-digging" is understood by different persons in different senses. We shall have a word to say next week upon this point.]

VEGETATION AND CLIMATES OF FOREIGN COUNTRIES.

UNDER this head it is proposed to collect facts and information which will doubtless be interesting to many of our readers; for most persons who trace the progress of vegetation in our own country are also fond of comparing it with that of other lands. A correspondent, resident at Nice, will supply us with observations from that quarter during the present season, and we shall add from other places such as may offer to us.

NICE, *Jan.* 12*th*, 1855.—The situation of Nice is on the southern coast of Europe, in the front of a large bay of the blue Mediterranean, and surrounded by a triple chain of mountains which afford considerable shelter from the cold winds of winter. The climate is, consequently, very favourable to vegetation, the average temperature being about 10° higher than that of London. Owing to the mildness of its winters a considerable number of English, as well as natives of other countries, resort there. Upwards of 600 families have arrived for this season, including 220 English, 216 French, 20 German, 15 American, and 24 Russian. It is nearly 1000 miles from London, but may be easily reached in five days. The railway from Paris to Marseilles is expected to be opened throughout next month, and will then offer still greater facility.

Very little frost is seen at Nice in ordinary seasons. This year there has been some in the valleys. In exposed places Heliotropes, Tomatoes, and young Potatoes have been cut, but Peas (the pods of which are still sold in the markets) look well, and many are in full flower. Alpine Strawberries are also purchaseable, 5 oz. for 4*d.*, grown in the vicinity. Greenhouses are quite rare, even with nurserymen, and very poor erections they are, hardly excluding the wind, with seldom any provision for artificial warmth. The gardens are certainly not well kept, and their general condition would not be tolerated in England. In fact, Nature seems to have done so much that the cultivators are careless in doing the rest. Cauliflowers are becoming plentiful, those of a very large size are about 6*d.* each; smaller ones, 2*d.* The Oranges, of which there is a good crop, are now getting ripe, their golden colour contrasting well with the deep green shade of the foliage. They are sold at 1*d.* to 2*d.* per dozen, or about 4 francs per 1000. The weather for the last month has been splendidly fine, only a few drops of rain since the 10th of December—like the best of our May weather in England. The sun has great power; the thermometer exposed to its rays often exceeds 120°. Potatoes are rather dearer than in England; and so is bread.

The principal flowers now used in the bouquets (all grown in the open air) are Roses, of various sorts, and very numerous; Ageratum mexicanum; a kind of large Candytuft called aspique; Violets, Acacia, Mignonette, &c.

The wild flowers in bloom are:—Erica multiflora (very abundant and pretty), Coronilla, Mignonette, Valerian, Anemones of various colours, Rosemary, Narcissus, and Mountain Pinks. In the valleys are also various sorts of Cistus, Arbutus, Bay, Box, Phyllirea, Privet, and much Myrtle. The American Aloe flourishes, and several have flower-stalks 20 feet high.

State of the Thermometer in the Shade at Nice.

—*E. C.*

CULTURE OF THE PEAR TREE.

ALTHOUGH the subject to which I have directed attention for the last eight months may be interesting to those who are more immediately engaged in the cultivation of Pear trees, yet it may not be so to many of your readers; I, however, feel it necessary to reply to certain objections made to my remarks by my friend Mr. Rivers, not with the view of convincing him of his error or changing his ideas, for I know that to be impossible but to place the question at issue in its right position. Without further apology, I shall therefore come at once to the point.

Is it true or is it not that for many years the crop of Pears, in a great number of gardens in England, has been defective? Is it true, or not, that in general the trees cultivated in the open ground, whether as Pyramids, Quenouilles, or Standards, have been much neglected as regards pruning, thinning, and clearing from insects?

It is impossible to reply to these questions otherwise than in the affirmative, and it has been with a view to remedy the evil that my contributions have appeared in your pages. Devoted to the culture of fruit trees in a climate and situation analogous to those of various localities in England, and having succeeded in their culture by persevering in the application of certain scientific principles, I have ventured to make my experience known in a series of articles in the pages of the *Gardeners' Chronicle*, and your readers will have been the best judges of their utility. In these, however, I certainly have had no intention of forcing my ideas upon any one, but rather of inducing some to take them up and put them into practice, offering, at the same time, to exhibit the good results I have obtained from the system I have pursued.

Instead of resorting to all sorts of strange allegations, to which it is needless to reply in detail, and which can only tend to confirm persons in a bad system of culture, would it not have been better to have made a fair trial of the application of the principles I have laid down, just by way of experiment? A careful trial made for two or three years would have shown which of us (Mr. Rivers or myself) is wrong; or whether want of success is to be exclusively attributed to difference of climate.

The advantages of growing as pyramids certain varieties adapted for standards have, I believe, been stated in a previous article. I doubt, however, whether my opponent knows them sufficiently to be able to judge of their merits. It is not on paper, but in a quarter of 100 of these fruit trees, four or five years from the graft, that, in the months of July and August, the utility of the system can be successfully shown, and yet the winds from the north sea or from the west are not less violent in the neighbourhood of Brussels than in Herefordshire [Hertfordshire?] or in any other county in England.

If I had not resorted to those standard trees for grafting upon them the new sorts sent out, from 1847 to 1851, by the successors of the late Van Mons, I should have had to wait three or four years longer before I could have seen the fruits and have ascertained their qualities. I even doubt whether the young plants sent out during the above-mentioned period, and subjected to artificial cultivation, would have been able to show for fruit last spring in the nurseries of Sawbridgeworth.

I have not hitherto adverted to the advantages and disadvantages of artificial cultivation, but I hope to notice them at the proper time and place, after having treated of that which is more substantial, durable, and of general application.

I hope my opponent, Mr. Rivers, will not be in too great haste to criticise our new pomological acquisitions, which he only knows by name! They are more important than he appears to imagine. Believe me they are the results of efforts which have cost too much time and money to be lightly judged of. I have tasted all these fruits, either from the seedlings on their fruiting for the first or second time, or from my own trees or those of my friends, and I hope next year to be able to submit good specimens of them to the judgment of the pomological committee, and thus be able to convince all as to their merits.

English cultivators will not have to wait so long to appreciate and possess these valuable varieties under their right names as they did in the case of the Beurré d'Hardenpont, Beurré Rance, Marie Louise, and Beurré Diel. It is very probable from their vigour and hardiness that most of these new sorts will succeed perfectly well in the climate and soil of England. It is also very probable that, in point of delicacy and long keeping, a large number of these varieties, of which the mean period of ripening is not yet completely established, will surpass all others at present in cultivation; and that this will be the case as long as they are not subjected to the influence of artificial culture, and as long as in propagating them the preference is given to scions taken at the proper time from trees cultivated on the Pear stock, and which themselves have been propagated from trees continued from Pear stock to Pear stock.

In conclusion, let me mention that the raisers of new varieties of Pears are not responsible for changes which may have been made in the names originally given them. Such changes ought to be attributed either to ignorance or fraud, and a prudent man ought only to deal with persons whom he knows well, and who have a reputation for honesty in business transactions. If then you will purchase in the cheapest market and get deceived, you have only yourself to blame. *J. De Jonghe, Brussels, Jan.* 1.

* With a hot wind from the North.

SWAINSONIA GALEGIFOLIA.

THIS is a plant which is well worthy of a place in every greenhouse, for, under proper treatment, it produces a profusion of pretty blossoms for some two or three months in succession.

It is easily propagated either by means of seeds, which are produced in abundance, or by cuttings of

the half-ripe wood. The shortest jointed firmest bits which can be obtained should be selected, and planted in a light sandy, peaty soil, covered with a glass, and placed in a shady part of a cool house for three weeks or so, and then removed to a slight bottom-heat, where they will soon emit roots. It will be found, however, that the cuttings are impatient of too much damp,—hence water should be applied carefully, leaving the glass off until the foliage gets dry, and removing it occasionally, to wipe out damp. As soon as the cuttings are sufficiently rooted to bear handling, pot them singly in 4-inch pots, and place them in a nice moist growing atmosphere till well established in their pots. Supposing the cuttings to be potted off and established by the end of May, which, if a plant is started early in spring to supply cuttings, may easily be the case, remove them to a cold frame, which can be kept rather close and moist and shaded from the mid-day sun. Attend to watering as may be required, and sprinkle the plants over-head on the afternoons of bright days, shutting up the frame rather early in the afternoon with a moist atmosphere, but give air before night. When the pots are found to be moderately well filled with roots, give a liberal shift, say into 7-inch pots, and water cautiously until the roots get hold of the fresh soil. Tie out the shoots, and stop any over-luxuriant ones, so as to keep the plants dwarf and well furnished, for they are of a somewhat straggling habit, and unless stopping and tying out are persevered in, compact specimens will not be obtained. Expose the plants freely to sunshine and air after the middle of August, in order to get the wood well ripened before winter, and if this cannot be conveniently done in the frame, remove the plants to a sheltered sunny situation out of doors. During winter they will require merely protection from frost, and a very spare supply of water, provided the wood has been well ripened, and they may be placed in any cold frame where they can be guarded from frost. As soon as they show signs of growth in spring remove them to a close part of the greenhouse, and cut back the shoots rather freely, in order to cause them to break close; and when free growth commences shift into 12-inch pots, and maintain as close and moist an atmosphere as can be conveniently done, until the roots lay hold of the fresh soil. When this is the case the plants will grow vigorously and will require attention to train the shoots so as to secure handsome specimens. Persevere in bending down strong shoots, and tie them so as to equalise the flow of the sap, and preserve compact specimens. Expose the plants freely to light and air, giving a liberal supply of water at the root, and syringing over-head on the evenings of fine days. By the middle of July the plants should be nice-sized specimens, and covered with blossoms, and they may now be removed to any light airy part of the greenhouse or conservatory, where they will be objects of considerable beauty till late in the autumn. After their beauty for the season is over, cut the shoots back to the well ripened wood, thinning them out pretty severely, and water very sparingly during winter. In spring, when they show indications of growth, turn them out of their pots and reduce the ball, taking care to injure the roots as little as possible, and repot in the same sized pots. By annual disrooting, and a free use of the knife to keep them dwarf, the specimens will last many years. Manure water in a weak state, given two or three times a week, when the pots are full of roots, will be of service.

Good sandy, turfy loam, and rich, fibry peat, broken up into small pieces, adding a liberal quantity of sharp clean sand, and some small lumpy charcoal or potsherds, will be found the most suitable compost in which to grow Swainsonias. *Alpha.*

COMMON THINGS.

Culture of the Cockscomb.—As a few well grown Cockscombs, stiff and formal though they be, are found to be very useful for decorating our greenhouses in summer, a word or two on their culture may not be uninteresting. About the beginning of next month make up a strong hot-bed for them, the same in every respect as is made up for Cucumbers. The mould in which Cockscombs have been grown to a large size, is half good strong loam and half good rich rotten dung and leaf-mould, but the greatest proportion dung. As soon as the plants are about 2 inches above ground, pot them off into 3-inch pots; and when they have nearly filled the pots with roots, shift them into some a size larger. A sharp heat should be kept up in the bed, and when the plants are wanted to be dwarf they should be kept very near the glass. The atmospheric heat should be 60° at night, and in clear sunshiny weather, with plenty of air, 70° in the day time; but a high temperature, without sun heat or bright light, would cause the plants to "draw," which would not only detract from their fine appearance, but likewise prevent the combs from attaining their proper size. Whenever it is found that the bed is too cold at the bottom of the pots, which should be plunged in sawdust or tan, recourse should be had to a new one, as it will be found that making a new bed will, in the end, be attended with less trouble than the continually applying linings to an old one. Care should also be taken, at the repotting, to have the pots perfectly clean; in fact, the newer the pots are the better. The mould in the pots should never be allowed to get very dry. Pots 8 inches in diameter will be sufficiently large for the last shifting. To sum up in a few words, the success of growing Cockscombs well depends principally upon paying attention to giving them a good mild bottom-heat, plenty of air, plenty of pot room, plenty of water, with as much light as possible, and plenty of room between the plants in the bed. Any one who carries out these directions fully may make certain of being rewarded with plants that will do him credit.

Poinsettia pulcherrima.—As this is universally admired for its gay crimson or rather scarlet bracts, which may frequently be seen enlivening the windows of the flower shops in Covent Garden market, the following hint on its treatment may be useful. The plants are best raised from single eyes (like Vines) taken from the hard ripened wood of last year, and they should be repotted into sandy loam and leaf-mould; keeping them in a Cucumber frame, and then in a low stove, as near the glass as possible. They do pretty well in a greenhouse or pit in July and August, if kept near the glass, and not drawn, and then put into the stove in September, watering them freely when in flower. Old plants which have been cut down never have the floral leaves so large as a young plant raised from eyes or cuttings.

Home Correspondence.

The Marie Louise Pear.—The name of "Nouvelle," recently applied to the name of this favourite variety in your columns (see p. 21), is I think calculated to mislead the public. In the catalogues of some of the Belgian nurserymen may be found the following names—Marie Louise (Duquesne), Marie Louise (Delcourt), Marie Louise (Van Mons), Marie Louise Nouvelle, Marie Louise de Jersey. These all resolve themselves into one, the Marie Louise, now universally cultivated in England, which was introduced about 30 years since, and at that time called by Mr. Braddick, from the free growing and hardy nature of the tree, "Braddick's Field Standard." M. de Jonghe in p. 21 alludes to the Eyewood Pear as a slender growing variety, requiring support while in a young state to form a pyramid. He has most probably not received the true sort, for of all the Pears under cultivation the Eyewood is the most robust in its habit, forming most rapidly a strong thorny tree, with a constitution adapted for all soils. We must not rest till we have a race of Pears raised from seed in this country equally hardy and robust. *T. R.*

Red Spider and French Beans.—I have to thank you for your advice as to the destruction of red spider (see p. 24). In your "Calendar of Operations" of the 6th inst., under the head of "Hardy Fruit and Kitchen Garden," the following passage occurs:—"Also see to providing a supply of French Beans. These are frequently grown in the early vineries or in plant houses, but their liability to the attacks of red spider renders them dangerous inmates of such structures." It so happens that in the house where my Peaches were attacked with this insect last autumn a crop of French Beans was grown; but I am unable to say whether it first appeared on the Beans or on the Peach trees. Since, however, this is the first instance of my ever having been troubled with red spider the circumstance is rather confirmatory of the correctness of your Calendar writer's remark. The practice of growing French Beans in vineries being very prevalent, if this vegetable has so strong a tendency to the production of the nuisance alluded to, many of your readers will doubtless be able more fully to corroborate the necessity of the caution than myself. *S. B., January* 17.

Reviewers' Discoveries.—Good news for you, Mr. Editor. I can communicate to you two facts which are probably as new to yourself as they were to me. Pray do not dispute or question their authenticity, for they may both be found recorded in the September number of the "Quarterly." The first is (p. 300) that Mr. Myatt obtained the British Queen Strawberry by "judiciously grafting the old stock." The second is (p. 302) that lovers of Mangoes can purchase them in "luscious luxuriance" at the frequent auctions held in Monument Yard. When, Mr. Editor, will your jogtrot publication give us such new, true, and interesting matter as we can thus obtain from the leading literary journal of Great Britain? *J. S. B.* [These are curious instances of the little that clever men know of "common things." Our correspondent will, however, we doubt not, agree with us in thinking that the article, notwithstanding the blemishes he points out, and others, is very interesting, and worthy the great periodical in which it appeared.]

Grafted Rhododendrons.—"J. R.'s" explanations of the principles on which he founds his objections to grafted Rhododendrons (see p. 821, 1854) do not, in my opinion, strengthen or establish his theory relative to the employment of layering instead of grafting; he has not given sufficient proof that the stocks generally used are inferior in strength or luxuriance to the finer hybrids, which is necessary before it can be considered expedient to discontinue the practice of grafting. Hybrids between arboreum and catawbiense or maximum (the seed being saved from either of the two last, otherwise the hybrids are not hardy) have the most robust habits of the crimson class, and plants raised from seed always assume a bushy habit, it being an almost invariable rule that hybrids adopt the habit of the female parent, and it is found that seedlings from ponticum or maximum will from the first be far more luxuriant than any of their hybrids; this fact will be apparent on a careful examination of any large or at least varied collection. Your correspondent, moreover, does not do justice to the fact stated in my last communication regarding the scions of grafted plants emitting roots and becoming ultimately independent of the stocks by being planted deep, a circumstance which ought to have removed his doubts, even allowing his premises to be correct. In his remarks at p. 6, 1855, he himself completely upsets his own theory, for he there complains of the over luxuriance of the stocks, which cause annoyance by throwing up suckers. This of course could be easily got over by even common management, and the gardener or amateur who neglects or grudges to pay that attention to this truly splendid family of plants fully deserves to get all his fine hybrids starved. To prune and remove them is part of his routine of business, and as necessary as his annual rose or fruit tree pruning. This evil is certainly not of so great magnitude as to warrant a total cessation of the good and very often expedient practice of grafting. The evil, if at all worth speaking of, is seen most in Azaleas, which during the first two or three years after being grafted, are apt to throw up suckers. These are, however, easily kept down, and as the scion gathers strength they gradually disappear. I could show "J. R." an extensive collection of Ghent varieties in this establishment, many of them grafted 14 years, which grow and thrive and flower every year to the admiration of all who see them, with none of the "broken off branch" appearance described by your correspondent. As regards the striking of Rhododendrons by cuttings, "J. R." will find by experience that though it is possible in some cases, it is as tedious and troublesome as in the case of Firs, if not more so, as it will take a great many years before they are fit to be planted out. *Hugh Fraser, Stanwell Nurseries, Leith.*

Spade or Fork Husbandry.—Since the publication of the "Word in Season," this mode of cultivation has been rapidly spreading. Any well ascertained facts as to the cost may be useful. One of your correspondents, in a recent number of your Journal, seems to question the accuracy of Mr. Smith's statements as to this matter. I have had from 8 to 14 men at work on my farm for the last four or five weeks in double trenching with Parkes's forks, the depth of the soil brought up varying somewhat according to its quality (which also determines the price of the work), being in no case less than 15 inches, and in one full 18 inches. I am just now finishing a field of 5 acres, which from the great dryness of the last year works heavily; the subsoil or under spit, which is placed uppermost in this enclosure, is principally a compact stony loam, but in one part a chalky marl. Probably the work is as difficult as would be found in most mixed soils. The stirred land as left by the men is 16 inches deep. The average of a day's work is between 5 and 6 rods each man, and the price I give for it is 6*d.* per rod. Two years ago, when the price of labour was lower, I had the same work done for 4½*d.*, but in that case the under soil being mild brick earth it worked easier, and to the depth of 18 inches. For some of the men I purchase the forks, they paying me 6*d.* per week for the use of them. Others purchase their own. I use Parkes's four-tined fork, the tines of which are 13 inches long. I have to-day measured several of these forks, which have been daily in use for five weeks, and the wear of the tines is from 3 to 4½ inches. In a less stony soil they would, of course, last much longer; on an average I think the expense of the tool may be put down at 6*d.* per week. The fork thus shortened is probably a better implement for stirring the soil in the summer, as recommended by Mr. Smith, than a new one, or for breaking up some 4 or 5 inches of strong clay where it is not desirable to go deeper. Mr. Parkes also engages to renew the worn-out forks if sent to his agents Messrs. Burgess and Key, of Newgate Street, at a cost of 3*s.* 6*d.* each. Occasionally, if carelessly used, a tine will break off at its junction with the cross bar, and I think they should be cast with more strength at that part, and the manufacturer would lose no credit if he was careful not to send out damaged work, which I have sometimes noticed. It is a costly tool for a labourer. None of my men earn less than 15*s.* per week, and some of them considerably more. I shall confine myself in this note to the cost of labour; hereafter I shall hope to send you the results of this system of cultivation, when the facts are clearly realised. *Henry Dixon, Dorwards Hall, Witham, Essex, Jan.* 13.

Societies.

Botanical, *Dec.* 14.—Prof. Balfour in the chair.—Dr. Balfour exhibited the following donations recently made to the Museum of Economic Botany at the Royal Botanic Gardens: from Wm. Murray, Esq., sample of sugar obtained from the Sugar Pine (Pinus Lambertiana); from Chevalier Claussen, specimens of paper-pulp and papers made from Corchorus olitorius, Tilia, Urtica dioica, Juncus, Pinus, Calluna vulgaris and Vaccinium Myrtillus; and Tannate of Soda extracted from the last mentioned. Dr. Balfour exhibited a peculiar concrete substance, called Pietra fungaia or Mushroom Stone, received from Naples by the Hon.

Lord Murray. Dr. Balfour read an extract from a letter he had received from Dr. W. A. White, Assistant Surgeon, 47th Regiment, dated "Camp before Sebastopol, Nov. 17, 1854," accompanying seeds of a superior Melon he had gathered in the orchards on the banks of the Katscha. "All who visited those orchards were surprised at the extraordinary abundance and variety of the fruit-trees. Very many different varieties of the Apple and Pear, Peaches, Apricots, Nectarines, Quinces, the Plum, the Cherry, the Walnut, the Almond, the Fig, were growing in the greatest profusion within the space of an acre, whilst the surrounding vineyards were laden with the finest Grapes. Vegetables too, were in great abundance, the enormous size of which excited our surprise, considering the little apparent amount of labour expended on their cultivation. The garden implements were rude and simple, a rich soil and a warm southern sun rendering any artificial operations unnecessary. The country after passing the Belbec is thickly wooded with dwarf Oak for the distance of about four miles, when a rapid descent takes place into the valley of Inkermann, at the south-western extremity of which Sebastopol is situated, which is surrounded with bare rocky hills nearly destitute of vegetation." Mr. W. Murray exhibited fresh specimens of the leaves, cones, and timber of numerous Coniferæ, brought by him from California, among which were Pinus Monticola, Jeffreyi, tuberculata, Benthamiana, Lambertiana, Abies grandis, nobilis, Douglasii, with species of Thuja, Taxus, and Cupressus, and Cone of Wellingtonia gigantea. He stated that he had likewise brought large quantities of the seeds of most of them. Among the papers read were:—1. *Sketch of the Life of the late Prof. E. Forbes.* By Prof. Balfour. 2. *On Hypericum anglicum.* By Charles C. Babington, M.A., F.R.S. In this paper the author states that he is disposed to look upon the Hypericum found by Dr. Balfour on the banks of the Glanmire river, Ireland, as identical with H. hircinum. He also mentioned that Mr. Isaac Carrol, of Cork, looked upon the plant as having been introduced in the locality mentioned. Mr. B. is disposed to think that the true H. anglicum of Bertoloni exists in Britain. A specimen agreeing with it in character was found by Mr. T. R. Polwhele above Falmouth harbour, Cornwall, and specimens of the same kind exist in Dr. Balfour's Herbarium, gathered by him on the banks of the Crinan Canal, in Galway, Ireland, and near Culross. H. anglicum is represented in English Botany, t. 1225, under the name of H. Androsæmum. It is distinguished chiefly by its much branched stem, two-winged peduncles, sub-cordate-ovate rather acute leaves, few-flowered cymes, ovate rather acute and unequal sepals, and by the styles exceeding the stamens. The paper will appear in the Annals of Natural History and in the Society's Transactions. 3. *On the Structure of the Anthers of Erica.* By John Lowe, Esq. The author remarked, "I have to bring before the Society's notice this evening a short sketch of two peculiar features occurring in the anthers of the Erica. The anthers of this genus are usually described in botanical works as consisting of two loculi, which open and discharge their pollen by means of lateral pores. So far this is true, for if we examine a fully expanded flower, the anthers will be seen to be free, and to have a pore or rather slit on each side; but if a young unexpanded flower be examined, the anthers instead of being free will be found to be connected together into the form of a circle, and no pores will now be seen. Their future disconnection appears to be caused by the increase of the pollen in the same manner that valves are separated in valvular dehiscence. The first who noticed the peculiarity above mentioned was, I believe, that very accurate observer, Mr. Robert Brown. 4. *Summary of the Flora of the Lake district of England.* By Mr. James B. Davies.

Notices of Books.

The Englishwoman in Russia; Impressions of the Society and Manners of the Russians at Home. By a Lady. 8vo. Murray. (10*s.* 6*d.*)

Russian Life in the Interior, or the Experiences of a Sportsman. By Ivan Tourghenieff, of Moscow. 12mo. Black. (6*s.*)

These two works convey a clear idea of the present state of society in Russia; in the first we have a vivid picture of the habits of the higher orders, in the latter we find a copious illustration of country life and of the condition of the peasantry. Both appear to be the productions of persons intimately acquainted with the nation. The Englishwoman is a lady who resided in the country for 10 years, and only quitted it when the present war broke out; the sportsman professes and seems to be a native country gentleman. The impression which our authors produce is unfavourable to the Russian character, and cannot fail to lower it in the eyes of strangers. Each tells the same story, although in different terms; the Englishwoman with infinite grace and vivacity, the sportsman in a somewhat tedious but sufficiently graphic way. From both we gather the general fact that all classes of society are utterly lost to what in the western world constitutes high feeling—brutality characterises the government; immorality society; misery the peasantry; venality everybody. There are many exceptions to this general charge, and it is right to state that among them is especially included the present Emperor, who is painted like an angel enthroned among fiends. To give a notion of the state of Russian high society as described by the Englishwoman, we take a few of the very striking anecdotes with which her pages are crowded.

A lady had imprudently touched upon some forbidden subject at a masquerade:—

"The next morning she was disagreeably surprised by a visit from an officer of the secret police, who politely requested her to accompany him to Count Orloff's office. Such an invitation was, of course, not to be refused—she went immediately. The gentleman who received her was *aimabilité* itself; he kindly pointed to a seat that stood near, and blandly proceeded to ask her a few questions concerning the previous evening's amusement, to all of which the terrified lady tremblingly replied 'the truth, the whole truth, and nothing but the truth,' for no equivocation would have availed her in that place. When the interrogation was finished, the chair suddenly sank through the floor, and I am ashamed to say that from the hand of some unseen person below she received a correction such as little boys used formerly to be subjected to from the birch of old-fashioned schoolmasters."

"The same misfortune is said to have occurred about four months ago to a certain noble princess from the south, who expressed some sympathy with the cause of the Western Powers. I have often asked Russians, when they were boasting of their great civilisation, if this were a proof of it. Once the reply was that 'a great many of the Russian ladies deserved to be beaten, and that it would do them a great deal of good.' At another time, in speaking of the peasant-women being so treated, a certain Prince A—— replied that 'they were not worthy of the title of women; they were no better than cattle!'"

"When abroad, the Russians invariably deny that such a state of things exists; they will even sometimes attempt to hide it in their own country, which shows that at the least they have the grace to be ashamed of it."

Money is the subject nearest to a Russian's heart:—

"In no country is more avidity displayed in the pursuit of gain; only speak of a piece of silver, and a Russian's eyes sparkle at the sound, and he is ready to do anything in order to obtain it. Copecks and whisky are the two greatest temptations of his heart. M. P——ski, a gentleman of education, assured me, only the morning I left St. Petersburg, that they were in much more danger from the pillage of the lower classes than from any exterior enemy; and he expressed the greatest fears for the consequences of bringing so many thousands of wild savages of soldiers into the town, for, if they rose, it would be *en masse*, and he was fearful that the great temptation offered by the sight of a civilised capital for the first time would shortly prove an irresistible one; if they did have an outbreak, it would sweep the upper classes away like a torrent."

The treatment of serfs makes us shudder as we write:

"One of the trials that took place before my friend's husband was that of a proprietress who had amused herself with shamefully cutting and maiming several children on her estates; when asked what could have induced her to commit acts of such demoniacal cruelty, her reply was, 'C'était pour me distraire!' She was exiled to Siberia."

"During our stay in Jaroslaf a commission was sent from St. Petersburg to inquire into the manner in which the slaves of a neighbouring estate had been treated by their proprietress. Her shameful conduct had driven the unhappy serfs to such desperation that some of them had found the means to escape, and had fled to the capital; they threw themselves at the feet of the Emperor, and implored him, in the name of God their common Father, to be their friend and protector, and to do them justice, as they had none other that would help them. His Majesty (who, if unbiassed by evil counsellors and interested landowners, is always ready to listen to the prayers of his poor peasants) promised that, if he found that they were guiltless, and had spoken truly, he would see that they received justice, and immediately gave orders that the strictest inquiries should be made concerning them. The result was that the estate was taken from the lady who had so ill-treated the peasants; she was allowed a small pension, enough to keep her from actual want, out of the rents, and the property was put under the care of trustees, that she should no longer have the power in her hands which she had so disgracefully abused. Even her daughters were removed from her guardianship, lest her example should have a bad influence on them.

"Many other instances have been mentioned to me in which the Emperor has displayed as much humanity as justice; undoubtedly there would be fewer abuses were it possible that the knowledge of them could reach him; but thousands of vile and unjust actions are committed that are hushed up and escape the punishment they deserve. The Russians stand infinitely more in fear of the Emperor than they do of their Creator. The common saying, 'The Czar is near, but God is far off,' gives a good idea of their feeling on the subject."

After reading such anecdotes as these we suspect that the reader will be tempted to ask with us—what then is the difference between Russian civilisation and Turkish barbarism? It is some consolation to find that so well-informed a person as our very clever and entertaining authoress is of opinion that this present state of things cannot last, but that some tremendous political hurricane is about to sweep over the country and purify the atmosphere; that in fact the Russians have already arrived at the reign of their Louis XV.

Garden Memoranda.

Mr. Loddiges', Hackney.—Immediately after the Crystal Palace Company had removed the last of the Palms and other plants which they had purchased of Mr. Loddiges to Sydenham, the large Palm-house here was sold by auction and cleared away, as well as all other glass, &c., which was not required to be retained, and now the once celebrated nursery grounds which the Messrs. Loddiges have held until within these last few months for nearly a century are laid out in sites for building, and so intersected by proposed new streets, that no trace of the old nursery with its arboretum and numerous plant-houses remains. Mr. Loddiges has, however, still retained his unrivalled collection of Orchids and Ferns, for which accommodation has been found on his own ground—a long parallelogram lying on the south side of the old nursery, and immediately behind his dwelling-house. Here a long lean-to house (the old Heath-house), and two span-roofed houses, together with a small show house, contain the entire collection, or at least all the specimen plants. Among those in bloom in the lean-to house were Odontoglossum Bictoniense, Oncidium divaricatum and other Oncids, several Zygopetalums, an extremely high-coloured variety of Lycaste Skinneri, and, what is not very often found in blossom, Dendrobium speciosum. There was also in this house, though not in flower, a large compact mass of Lælia superbiens, which promises in a year or two more to be a noble specimen. In one of the span-roofed houses Sophronitis grandiflora was in bloom on blocks suspended from the roof, and on a shelf below them were several plants of Broughtonia sanguinea, the bright crimson flowers of which have a cheerful appearance at this season of the year. This plant requires little moisture, but it likes plenty of light and heat, and therefore it is found to do best when grown close to the glass, where it gets well roasted by the sun. The large yellow Oncidium bifolium and one or two Lady's Slippers were also in flower in this stove. The other span-roofed house is glazed with rough plate glass, and is entered through the show-house, which is at present filled with Camellias and a few rare Ferns. Among the latter was a noble plant of the handsome Gleichenia scandens, a New Holland species nearly allied to G. microphylla; also Mertensia flabellata, another New Holland species of great beauty; and here, in a Wardian case, was likewise the New Zealand Todea pellucida in the shape of a little tree with short stem and spreading branches (leaves). This is a Fern which requires a good deal of care to cultivate, and it is very difficult to propagate; its beauty, however, amply repays any extra attention which it may demand. The Orchid-house connected with the show-house just mentioned is glazed with rough plate-glass, and a little strip of zinc about 2 inches wide, bent to a right angle in the middle, is tacked on below each astragal, in order to carry off condensed moisture which would otherwise fall on the plants in the shape of drip. This is found to be a cheap and good way of remedying the evil. Among plants in flower in this house, we remarked Dendrobium anosmum, a handsomer kind than D. macrophyllum, to which it is related, and it has none of that Rhubarb scent about it which belongs to the last-named species. Associated with it were also D. albo-sanguineum and Dalhousieanum, the ivory-white flowered Cymbidium eburneum, the variety of Aerides affine sometimes called Colonel Fielding's Foxbrush, a noble plant of Cœlogyne asperata, otherwise called Lowii, Ansellia africana, and a few other plants, all of which were in very good condition.

FLORICULTURE.

Pansies in Pots.—My cold frames are again becoming gay with these delightful spring flowers. Duke of Norfolk, Sir Philip Sidney, Disraeli, Ophir, Robert Burns, Euphemia, France Cycole, Mrs. Beck, Duke of Perth, Climax, and one or two seedlings which I expect will be first class flowers, already arrest attention. Those who have never tried to cultivate the Pansy in this way have little idea what a profusion of really gay flowers is produced by this plant during the whole of the early months; and with proper attention they will blossom in good character till the latter part of May. As regards cultivation, little need be said; for the Pansy is not difficult to manage. Plants for early flowering should be potted up from the open ground in October. If the weather is open in the last week in January, or the first week in February, begin to repot generally, using soil consisting of good decomposed turfy loam, rotten manure, a little leaf-mould, and coarse sand, the latter in proportion to the nature of the loam. The soil should not be pressed hard with the hand; no water should be given for a day or two after potting. Before, as well as after this operation, the plants must be kept well up to the glass. They should have from two to six shoots, or strong leaders; and to keep them to these chosen shoots, a number of small ones must from time to time be removed. These cuttings answer the double purpose of strengthening the main shoots, and producing a stock of young plants which will supply the place of the old ones when worn out. Keep the frames in which they are placed open whenever the weather is favourable, pulling the lights back or tilting them up; maintain the plants in a growing state by watering them as often as they require it, going over them for this purpose every day. Plants that have several shoots should be tied into shape, placing the centre-branch upright in the middle, and

the remainder at equal distances all round; but the plant must be shaped according to the number of shoots: three leading branches are sufficient if cut blooms only are required. Another advantage is, that the same plants, from the succession of bloom they produce, will answer the double purpose of exhibiting in pots or stands of cut flowers. After the potting, as above recommended, has taken place, take the earliest opportunity at which the ground is in a fit state, to plant out any stock not required to bloom under glass, or plants that have been wintered in stores, &c., which will bloom through May or June, and produce a stock of good healthy cuttings. By following the simple and inexpensive treatment just recommended, I am sure that those who take the little trouble that it entails will not fail to be gratified by a fine display of bloom, which, from its long continuance, will most certainly afford much gratification. *T.*

THE AURICULA.—About the middle of March, if the weather is fine, the trusses will be getting sufficiently forward to select those intended for exhibition. Seven pips are the lowest number allowed by our metropolitan societies; therefore select the most promising, containing that number and upwards. Those with round buds, as nearly of a size as possible, the truss also round and compact, should be particularly selected, and if there are any monster pips among them with large oblong tubes or other deformities, remove them while young. At this stage of their growth, care must be taken in watering that none be allowed to fall into the tubes or pipe, if it happen to be exposed, as is the case with some varieties; for although the buds be so young, the meal of the eye may be formed, and if so the water will run the meal over the ground-colour, and when the blossom is expanded it will be found dull and unfit for exhibition. The mealy-grass varieties require a little extra attention, for their beauty is much increased by preserving the white powder on their foliage. To obtain this object without drawing the plants more than possible, I nail a strip of wood on each side the centre bar of the frame, of sufficient width to shelter them from rain, and place the plants beneath it. By this means they enjoy a free circulation of air and light till in a proper state of forwardness to remove under the hand-glasses, or on the stage. *L.*

POLYANTHUSES IN POTS.—The Polyanthus under pot-culture does best in a western aspect from the present time to the end of its blooming. Give as much air as possible during the day, unless strong cold winds are blowing; then keep the lights on. If the frame is in a western aspect, give air at back, by lifting the lights about three inches; but if in a southern one, lift the lights at the front. Protect them at night: a mat or two thrown over the frame will be advisable. Top-dress as early next month as you can, if the atmosphere is not frosty. Polyanthuses thrive best in a cool soil, rather strong in quality than otherwise. One measure of decomposed cow-manure, two of leaf-mould, and two of strong loam (top spit), are suitable for them; but for top-dressing only, the compost given for the Auricula will answer. Water them moderately, increasing the quantity as the plants increase in growth; and allow them to receive light showers during the month when the weather is open. *B. W.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Where the twiners for covering the roof are grown in boxes, or have but limited root room, as much of the surface soil should be removed annually as can be done without seriously injuring the roots, replacing it with some good rich, fresh material, and this cannot be done at a better season than the present. The conservatory or show-house should very soon be full of floral beauty. Camellias, Luculias, Epacrises, Heaths, Primulas, Mignonette, Tree Violets, Cinerarias, Daphne indica, and many other showy things, may easily be had in bloom about this time; and, with proper convenience, a few Roses and other forced plants, as Oranges, bulbs, &c., should also be coming in, and will greatly assist in maintaining the gaiety so desirable in this house.

FORCING DEPARTMENT.

PINERY.—There is often considerable difficulty experienced in getting the requisite number of plants to show fruit at this season, and where this is the case every advantage should be taken of mild weather to maintain a brisk temperature, which may be kept at from 70° to 75° by night, and 80° to 85° by day. The difficulty of getting plants to show fruit is generally the result of their growth not having been properly matured in time to allow the plants a period of comparative rest before subjecting them to forcing with the view of getting them to show fruit, and where any difficulty of this kind is experienced timely attention should be given to the preparation of the plants for another season, which is the only means of having them at command. All that can be done this season, however, with backward plants will be to take advantage of bright days to maintain a brisk temperature, letting it rise to 80° or 85° with sunshine, and 70° to 75° should be secured at night. Maintain a moist growing atmosphere, but do not syringe plants overhead that are showing fruit. Also see that the roots are in a properly moist state, using tepid water where any is wanted. VINERY.—In houses being started use means to get the buds to break regularly, and where necessary bend the Vines, raising the backward buds to the highest point; maintain a moist atmosphere, and sprinkle the Vines morning and afternoon. When the buds begin to break the night temperature may be increased a few degrees, but it should not exceed 55° until they are all fairly started, and 65° by day should not be exceeded except with sunshine and air. Rub off all superfluous buds, taking care to leave the stronger ones, but in cases where there is any fear about the show of fruit, it will be advisable to leave all promising buds until the bunches can be perceived. It is only in cases, however, where the Vines are in a bad state that there need be any fear about destroying all superfluous buds as soon as this can be done. Admit air on every mild day, using a sufficient amount of fire heat to maintain the proper temperature. Look well to the border, and see that it is protected from wet or sudden changes of weather; and, where fermenting materials are used, turn them as often as necessary, adding a small quantity of fresh leaves and dung, in order to maintain a steady heat.

FLOWER GARDEN AND SHRUBBERIES.

Let the most be made of fine weather when it returns, in the way of pushing forward new work, alterations, and all out-doors operations, for we may expect any time to have unfavourable weather for such work, and the ordinary spring duties will shortly be requiring attention. Where the turf is at all unlevel time should be spared in course of this or next month to repair this, as if lifted later than February it might require some attention to get it to take quickly. Unlevel turf is an eyesore the season round, and it makes the mowing more tedious and difficult, hence it is worth an effort to spare time to make whatever little repairs may be necessary here. Sweep lawns occasionally to clear them of fallen bits of branches, &c., and use the roller here and on gravel frequently to secure a firm smooth surface. Let the stock of plants, except those that may be wanted to furnish cuttings, be freely exposed to air whenever the weather will admit, so as to keep them hard and render them less liable to damp off in the event of their having to be kept covered up for some time Any of the stock from which many cuttings are wanted should be removed to a light warm situation without loss of time, first washing the pots and clearing and adding a little fresh soil to the surface of the ball. Some kinds of Verbenas, &c., are very subject to mildew when placed in heat in the winter season, but this is easily kept in check by means of sulphur, only let the sulphur be applied the moment the pest makes its appearance.

HARDY FRUIT AND KITCHEN GARDEN.

If any planting of fruit trees still remains to be done this should be seen to very soon, and every available despatch used to get it completed. If it is worth while to occupy ground with fruit trees, and incur the expense, &c., of planting them, it certainly is worth consideration whether the ground is in the best possible state of preparation for being planted with fruit trees, and to incur any expense and trouble which may be requisite in order to render the ground as suitable as can be made for the kind of trees with which it is to be planted. To do this is seldom a work involving much direct outlay, for provided the ground is well drained, there is little else required except labour, materials for concreting, and a supply of good loamy soil, all of which can generally be obtained about most places. But it is useless to plant trees without there is a fair prospect of their doing well, and the necessary preparations for securing this can be more conveniently, cheaply, and efficaciously made before planting than afterwards, and the requisite preparations should be made, even if doing this should necessitate putting off planting until another season. Push forward the digging or trenching as the case may be, and get all vacant ground turned over as soon after this as circumstances will admit. In the kitchen garden as in other departments alterations will occasionally be required, such as taking up and relaying Box-edgings that have become imperfect, or those that have grown too strong and bulky, turning or covering walks with fresh gravel, and such jobs should be done if possible before the busy season.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.
For the week ending Jan. 18, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 23d, 1854—therm. 53 deg.; and the lowest on the 25th, 1827—therm. 15 deg.

Notices to Correspondents.

CAMELLIAS: *B.* The blemishes on the petals of your flowers are, doubtless, caused by cold and damp. ‡

CHESNUTS: *X X* will be obliged by some of our correspondents informing him what is the best mode of preserving these from the ravages of mice after they are sown.

GEOLOGICAL ADVERTISEMENT: *Doone.* What would you think of such an advertisement as this?—"Naturalists are hereby requested to satisfactorily deny the following statements:—The sun shines by day. The solid constituents of plants are formed out of water, carbon, nitrogen, and various saline matters. The best reply to the above will be published at the expense of the *Challenger*, provided it be not too long." Would you not think the advertiser a lunatic?

HOLLY HEDGE: *A B.* There is no objection to the plan proposed: but a better way would, perhaps, be in the end of August or beginning of September to take up the whole of the hedge and replant it, trenching the ground as you proceed, and working in young plants where they are wanted. As you plant settle the soil well about the roots with water; but do not trample it, and cover in the whole with a little dry soil to keep in the moisture. If you have plenty of manure, a small quantity of it well rotted may be mixed with the mould, which is put about the roots; but the best way would be to use it in the shape of good mulching on the surface. ‡

ICE: *W B.* Do not use salt. Pick the ice from any *clean* pond or river. Do not pound it, but pack it as closely as possible, and remember that the more solid the pieces are the better it keeps. The thin surface ice with which we are so often obliged to be satisfied in this country keeps badly. If you could freeze the whole contents of your ice house into a solid mass, it would keep better; but how will you get it out when you want it?

INSECTS: *T Y.* The white matter on the shreds of your Plum tree seems to be the secretion of a coccus or scale insect; if so, your trees ought to be scrubbed with a brush and hot water (140°), and all the shreds and dead wood cut away. *W.*

KITCHEN GARDEN REFUSE: *Young Gardener.* Provide a hole well lined with puddled clay; into this put daily all your soft vegetable refuse, waste kitchen stuff, and house slops. Whenever you burn weeds, or sticks, or clay, add the ashes to the heap. Carry to it all the leaves you don't want for leaf mould. After laying five or six summer months, take it out, turn it well over, and begin a new heap. In six months more it will be good manure. You may hasten its decay and improve its quality by adding gas-water from the gas-works if they are near. As to the seeds of weeds, if you are good for *any*thing as a gardener, no weeds will be allowed to seed near you. Do not add old tan, which ruins a "mixen," unless you burn it, when its ashes become as valuable as other wood ashes. If the heap becomes offensive, you must either add peat charcoal, or cover it with earth.

MOSSY APPLE TREES: *Lichen.* Scrape the moss off by all means, and burn it. You need not meddle with the twigs, but confine the operation to the trunk and main branches, which you cannot easily hurt. A trowel is a good instrument, as it is handy to use and takes off all the loose bark as well.

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Leo.* It is Ipomœa Quamoclit, a tender annual. It requires rich warm soil, and a warm corner in the garden, when all night cold is over. Your plants seem to have died from wet, cold, and the want of fresh air. We should not sow it before April. We have seen it flowering beautifully in the warm light soil of Norfolk.

NAMES OF FRUITS: *G F.* From your description and sketch of the Apple grown about Norwich, it is, doubtless, Hubbard's Pearmain.—*B A.* 1, Early Nonpareil; 2, Easter Pippin; 3, Like Golden Reinette; 5, Bedfordshire Foundling; 6, Syke House Russet. The Pear is unknown, probably something wild; you may mark it worthless.‖

OXALIS: *A H.* would be glad of a list of hardy Oxalis, conspicuous enough to be worth one's cultivating. He only knows of Floribunda, and Deppii, and Bowii doubtful.

POMOLOGICAL SOCIETY: *J T.* We do not know what the arrangements are. You should apply to the Secretary, 20, Bedford Street Covent Garden.

POTATO YAM: *Z.* You have received young tubers, not sets. The latter are, we presume, unattainable at present.

SIKKIM RHODODENDRONS: *Old Sub.* The following varieties of these are now set with flower-buds in the Hort. Society's Garden at Chiswick, viz., Edgeworthi, cinnabarinum, glaucum and its dwarf variety, ciliatum and its variety, alpinum, Thearflorum, and niveum.¶

TEMPERATURE: *Strawberry-leaf.* The following was the ground temperature at 1 foot and at 2 feet deep, for the months of November and December, from 1844 to 1854 inclusive:—

Depth.	Months.	1854.	1853.	1852.	1851.	1850.	1849.
1 foot ...	November	46.58	44.28	47.97	41.18	46.28	46.96
	December	42.69	38.19	45.69	41.26	40.54	41.32
2 feet ...	November	47.58	47.30	47.85	41.96	47.75	49.05
	December	44.43	41.56	45.17	41.06	42.30	43.01

Depth.	Months.	1848.	1847.	1846.	1845.	1844.
1 foot ...	November	44.83	47.96	48.03	46.20	46.45
	December	43.59	44.14	38.21	41.48	36.95
2 feet ...	November	46.06	49.71	49.61	47.73	45.85
	December	45.29	45.67	41.06	43.47	39.79

From the above it appears, that in
Nov. { The highest mean temperature occurred in 1846...48.03
The lowest ditto ditto 1851.. 41.18
Dec. { The highest mean temperature occurred in 1852...45.69
The lowest ditto ditto 1844.. 36.95

TRITOMAS: *A H.* solicits information respecting these plants, especially as to Aurea and Burchelli.

VEGETABLES: *A R.* The Persil-Celeri (Neapolitan or Celery-leaved Parsley), is a large sort of Parsley; the leaf-stalks are blanched and eaten like those of Celery. In order to blanch the stalks, they must of course be earthed up. The Navet jaune de Finlande or Yellow Finland Turnip, is an excellent small, regularly-formed Turnip with sugary tender flesh. The top is small, as is also the tap root; the latter proceeds from the centre of an evenly-rounded bottom. As a garden Turnip for winter use it well deserves cultivation.‖

WOODS AND FORESTS: *Quercus.* The last Blue book we have seen is No. 377, ordered to be printed July 17, 1854. We have before us a "report," dated Dec. 7, 1854, by Messrs. Mathews, Murton, and Menzies upon the state of the forests and their management, but we can place no confidence in the statements of persons who could be concerned in such a dark transaction as that which ended in the dismissal of Mr. Brown.

MISC.: *Diss.* It is a rule at all publishing offices not to interfere with the wording of advertisements, or to refuse the insertion of anything unless against good morals.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

CYANIC MANURE COMPANY.
WHITE'S PATENTS.
Directors.
The Hon. J. W. Fortescue, 17, Grosvenor Square, *Chairman.*
The Hon. R. E. Howard, D.C.L., Garden Court, Temple.
G. P. Irvine, Esq., 15, Pall Mall.
General Macdonald, C.B., 72, Onslow Square, Brompton.
Newton S. Scott, Esq., 5, Lowndes Street, Belgrave Square.
Bankers—Messrs. Herries, Farquhar, & Co., St. James's Street.
Agricultural Chemist—William White, Esq.
Solicitors—Messrs. Vallance & Vallance, 20, Essex Street, Strand.
Secretary—Mr. W. F. Mould.
Offices, 37, Charing Cross, London.
This Company is formed for the manufacture and supply of the three following valuable preparations, invented and patented by Mr. WILLIAM WHITE:—CYANIC MANURE, CYANIC DEODORISING POWDER, CYANIC PLANT-PRESERVATIVE.
The Cyanic Manure is the successful result of many years' patient investigation into the economy of the vegetable kingdom, and possesses several distinctive features of superiority over ordinary farm-yard manure, and the great majority of those known as artificial. To the Agriculturist it will be found to afford all the elements of fertilisation in their *just proportions:* this assertion is founded on *positive experience.* It is manufactured in the form of a portable *inodorous powder*, and is used at the average rate of *three cwt. to the acre.* Like Guano, it is sown broadcast or drilled in with the seed; and for Wheat and other grain crops is most efficacious. In its application to TURNIPS, SWEDES, MANGOLD WURZEL, and ROOT CROPS GENERALLY, as also to CLOVER and GRASSES, it has proved to be equally successful. To the Gardener it is essentially valuable, as presenting the richest manure in the simplest form, which can at pleasure be used by either being drilled in with the seed, or broadcast over the soil. Price of the Cyanic Manure, 8l. per ton, packages included, and delivered free at all the Railway Stations and Wharfs in London. The above are not submitted to the public until every assertion relative to them has been tested by patient and successful experiments, and witnessed by judges of the first authority.—Orders addressed to the Secretary, at the Offices of the Company, No. 37, Charing Cross, London, or to the several Agents, will receive prompt attention.
Agents.—London: Mr. J. E. SAUNDERS, 7, Lower Thames Street.
Exeter: Messrs. LUCOMBE, PINCE, & Co., Seedsmen.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

MANURE TRADE AGENCY.—The Advertisers require AGENTS for the sale of a new and first-class Manure. As they will be supplied with an article equal, if not superior to any artificial manure of the day, it is needless for those who expect a large commission for the sale of a worthless article to apply.—Alpha, care of Mr. Jordan, 8 Gracechurch Street, London.

ROT IN SHEEP.—We, the undersigned Churchwardens and Overseers of Castor, near Peterborough, Northamptonshire, wish to inform the public that we have had Medicine from Mr. FOUNTAIN, VETERINARY SURGEON, &c., Market Deeping, Lincolnshire, for years, for the direful disease, the Rot in Sheep; and we do declare that it has cured every Sheep we and our neighbours in the adjoining parishes have given it to, although in the last stage and in the lambing season; and we highly recommend Mr. FOUNTAIN, and will satisfy every inquiry.
WM. CALLOW, PETER DICKENS,
WM. BERRIDGE, RICHD. MARROTT.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM-ENGINES, AND COMBINED THRASHING, STRAW SHAKING, RIDDLING, AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as thrashed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. and Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading agricultural shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.
SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.
Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.
N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
John C. Cobbold, Esq., M.P. | William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S. | Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq. | Samuel Morton Peto, Esq., M.P.
Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute works of Drainage, Irrigation, Road-making, Enclosing, Reclaiming, and the Erection of Farm Buildings upon any Estates, under Settlement, Mortgage, or Disability, and without any investigation of Title, to charge the total amount of the outlay and expenses upon the property improved, to be repaid by annual instalments, varying according to the number of years over which Landowners may determine the repayment shall extend, within the limits of 31 years for Farm Buildings, and 50 years for Drainage, Roads, and other Improvements. Arrangements are also made with Landowners for the execution of the works by their own agents, and for the supply of the capital or repayment of their own advances, through the exercise of the Company's powers. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
The first Session of 1855 will begin in February. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40l. per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

BIRMINGHAM CATTLE AND POULTRY SHOW.
TESTIMONIAL TO MR. T. B. WRIGHT.—The Committee appointed to promote the SUBSCRIPTION for the PRESENTATION of a TESTIMONIAL to Mr. T. B. WRIGHT, in acknowledgment of his important services in originating the Birmingham Cattle Show, and for the valuable assistance he has contributed towards its management, respectfully request that the friends of the above gentleman, who are disposed to participate in this well-merited tribute of respect, will do so at their earliest convenience.
HOWARD LUCKCOCK, Chairman of the Committee.
JOHN LOWE, JOHN MORGAN, Jun., } Honorary Secretaries.
38, Bennett's Hill, Birmingham, January 20, 1855.
Subscriptions to the Fund will be received by the Treasurer, Mr. John Shackel, Blenheim House, Small Heath; Mr. John Lowe (of the firm of Mapplebeck & Lowe), Bull Ring, Birmingham; Mr. John Morgan, Jun., Cattle Show Offices, 38, Bennett's Hill; and by the Bankers, Messrs. Attwoods, Spooner, & Marshalls, New Street, Birmingham.—Post-office orders should be made payable to Mr. JOHN MORGAN, Jun.

The Agricultural Gazette.

SATURDAY, JANUARY 20, 1855.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, Jan. 25—Agricultural Imp. Society of Ireland.

MOST of us have read the amusing account of our LONDON COMMISSARIAT, given in the last number of the "Quarterly Review." The 2,000,000 quadrupeds which, according to it, contribute most of our supplies, are about to change their weekly place of meeting. Monday next will be the last on which our metropolitan market will be held at Smithfield. The drove of oxen 10 abreast described by the reviewer as 70 miles in length, which provides our annual supply of beef, will for the future congregate in Copenhagen Fields, greatly to the advantage of owners, purchasers, and consumers; the droves of sheep 120 miles in length, of calves and pigs some 20 miles in length, which with these cattle form our annual supply of butchers' meat, will be penned hereafter in room and comfort—neither of which could be obtained within the narrow area of the present market.

Our engraving in another page points out the relative positions and extent of the several kinds of accommodation which for the future are to be given to the most important trade (hitherto) *within* the City.—Smithfield market is an irregularly-shaped area, intersected by numerous thoroughfares and streets: Copenhagen Field, it will be seen, forms a quadrangular area intersected only by such roads as adapt it for its market purposes. The former is but 6½ acres in extent, no larger than it was when London held one-fifth its present number of consumers: the latter is five times as extensive—only a portion of its area, however, being required for the market proper. Thirty-five thousand sheep will find standing room within it, in nearly 1800 pens; and there are more than 13,000 feet of rail, to every two of which a bullock may be tied. The pens for sheep and railing for the cattle can be readily identified in the drawing. The engraving represents the place as seen from the west or south-west corner. The two rectangular partly-covered courts on the west side of the sheep-pens, are areas of an acre each for the accommodation of calves and pigs respectively. Shelter while on sale, and convenience for despatch by carts (the floor of the greater part of these two markets being on a level with the cart-bed above the roadway) are thus provided. On the western side, the buildings immediately at the foot of the engraving are only partly built—they are the public slaughter-houses and the meat market. On the same side, west of the calf and pig markets, is the lairage for sheep, providing accommodation for 8000 on an area of 6 acres. This space is divided into yards, a part of each being covered, and each being furnished with hay-racks and with water-troughs. The lairage for 3000 bullocks, on an area of 8 acres—similarly divided into yards, each of which is provided in like manner with shelter and with food—lies to the south and south-east of the ground. Each of these spaces has at short intervals water laid on for use either in cleansing or for consumption. At the eastern end of the area, beside the Great Northern line (which runs under one corner of it), a hide and skin market, not yet erected, is represented as being intended; and on the other side of that line additional slaughter-houses, as required, may be built. The central building with the clock tower will furnish accommodation for the several banking establishments; and public-houses at the corners, with two large hotels on the northern side—the Queen's Arms and the City Arms—will supply refreshments to the salesmen and their customers, who will conduct the enormous trade that is next week to find its new channel here. At the south of the area a cattle station will be erected by the London and North-Western line, and access from the northern, and western, and eastern districts of supply will thus be easily provided—these being the quarters from which much the largest quantity of meat at present reaches us.—We may add to the above that there is abundance of unoccupied space belonging to the market, into which it may extend itself as London grows and its necessities increase.

Business will be conducted here as hitherto; by the same men, under the same regulations, in the same manner, after the same rates, on the same days, and at the same charges. The only differences will be those arising out of change of place; but how great these will be to the comfort of the men employed and of the animals disposed of, and therefore to the interests of the owners and consumers of the stock, any one who has witnessed Smithfield on a crowded day can readily anticipate. The barbarity of goading into "ring droves" imposed upon the salesmen by the limits of the present market will be avoided; this, and the avoidance of the present brutal driving through narrow crowded streets, will together save much in value of the animal up to the time of sale and much in the after quality of the meat.

There will now be room enough and accommodation, too, to enable the 30,000 sheep and 5000 head of cattle, and a thousand head apiece of calves and pigs which may be congregated here on the Monday after next, to find their way and find their place, and leave it for the slaughter-houses, without the need of reckless packing and all the cruelty by which it is effected Ten or twelve banking houses, several hundred

salesmen, and many hundred drovers will transact with ease and comfort the business of many millions annually, which has been conducted hitherto under difficulties as to space and access to it, which have imposed upon our London market the roughest character for recklessness and cruelty. We have given in another column a description of the market as hitherto arranged; we doubt not next week will see the commencement of a very great improvement. This will have been owing to an expenditure of about 300,000*l.* upon the Copenhagen Fields, under the superintendence of Mr. BUNNING, City architect. We learn that the works have been contracted for and constructed by Mr. WILSON, of Southwark, the contractor for the buildings, Messrs. KENNARD, of Thames Street, who provide the ironwork, and Mr. CHADWICK, the contractor for the roadways and the paving.

A rumour has prevailed in the City during the week that the opening of the market was to be delayed; but on inquiry at the architect's office we find that although the existence of the report was known there, they knew of no foundation for it. The market commissioners only await Lord PALMERSTON's authority; and their intention is to open the place for business for the first time on the 26th of January. From the statements made in the Common Council on Thursday, it would seem as if the committee were themselves quite in the dark on this subject; but it appears that if they obtain the authority of the Home Secretary there will be nothing in the condition of the works to hinder the carrying out of the original intention. The act of Parliament from which they derive their power requires that the market be removed within three years and six months of the date of its enactment, a period which expires on the 1st of February.

12. Banking-houses and clock tower.

DR. VOELCKER has kindly forwarded to us his report upon A POISONOUS "RAPE-CAKE," which proved fatal to some cattle belonging to Mr. SMITH, of Bibury, near Cirencester. The adulteration of Rape-cake with Mustard seed is a matter of very serious consideration to farmers. The use of this article as food is rapidly extending, and its liability to this sort of poisonous adulteration is thus more than ever a matter to which attention should be drawn. We are, therefore, much obliged to Professor VOELCKER for the information he has published. In the letter originally addressed to EDWARD HOLLAND, Esq., of Dumbleton, he says:—

"Allow me to direct your attention to a cake, of which I inclose a small piece. Apparently it is a sweet-smelling and good-looking Rape-cake, from which it cannot indeed be easily distinguished on simple inspection. It is, however, a cake which is sure to kill any animal, if used for feeding purposes, instead of manuring land with it, the only use to which the farmer can apply it in quantities. This cake, I have found on examination, consists entirely of the expressed *seeds of Mustard*. My attention was directed to the subject by Mr. ——, who had two beasts killed in consequence of their having eaten a small quantity of the enclosed cake. Having tested the cake in vain for arsenic, lead, copper, and other kinds of metallic poisons, I found that some of it digested in cold water, in the course of a couple of hours, had become as pungent as *Mustard*, and on distillation I obtained in reality the highly irritating characteristic smelling volatile oil of Mustard. Thus, it was plain that Mr. ——'s beasts were killed by *Mustard powder*, which incautiously had been given to them instead of Rape or Linseed-cake.

"It is a curious fact that Mustard seed *whole* does not contain any *volatile oil*. This is only developed (and very gradually), if the powdered seed is moistened with cold or lukewarm water. Boiling hot water does not produce it, because it coagulates the albuminous substance in Mustard seed, which substance (in a moistened state), transforms a peculiar constituent of Mustard, called by chemists *myronic acid*, into volatile oil of Mustard. This myronic acid has as little smell as the albuminous substance which acts upon myronic acid as a ferment, which is called myrosin. For this reason, Mustard mixed only a few minutes before its use has hardly a pungent taste, and a Mustard cataplasm at first does not cause any inconvenience; but when kept too long in contact with the skin, it produces blisters. In either case, oil of Mustard is gradually formed from myrosin and myronic acid. Hence the inclosed cake you will find does not taste pungent at first; but, if you will coarsely powder it, and make it into a paste with a little water, you will have no difficulty in recognising its origin. This instance affords a new proof—if such were necessary—that farmers might often save many pounds, if they would but spend a few shillings in analysis. I hope you will excuse this lengthy epistle—the importance of the subject must be the apology."

Cases of this kind are now, as we have said, not unfrequent, and we see one has been reported to the *Macclesfield Courier* as occurring near Sutton, in Cheshire, where two beasts out of three to which the adulterated cake had been given died in the course of an hour after eating it. It was evident to the owner of the cattle that the cake must have contained some poisonous or deleterious mixture; and he forwarded a portion to Mr. F. C. CALVERT, Professor of Chemistry, at Manchester, to be analysed; the result proved that the cake contained a large portion of Mustard seed, the action of which, in the stomach of a cow, was reported by Mr. CALVERT to be such as to produce death. Upon this report being made known to Mr. THORLEY, the respectable seed merchant in Hull from whom it had been obtained, he at once returned the cake to a Russian firm, from whom he had purchased it; they declined to receive it, and sued him in the County Court at Hull for the price, and the trial, which excited great interest amongst the merchants there, took place a few days since, when a verdict was given in favour of Mr. THORLEY. Mr. THORLEY very honourably reimbursed the owner of the cattle for his loss and expenses, and he is now proceeding for damages against the parties who sold the cake to him. If similar cases were only followed up and sifted in this way, such frauds would be less frequent.

THE SMITHFIELD MARKET.

SMITHFIELD is an irregularly-shaped area of 6½ acres, intersected by numerous streets. When first appropriated to market purposes, it was situated outside the walls of the city; but the population and houses having increased tenfold, it is now nearly equi-distant from the northern and southern suburbs. One of the great thoroughfares to the Eastern Counties Railway passes through it, dividing it into two departments; in the one of which, 1506 open pens are erected for sheep, calves, and pigs, and in the other, railing to which 2750 beasts may be tied. The rails are placed sufficiently far apart to admit of 1250 more beasts standing in what is technically termed "ring droves"—from 10 to 20 cattle goaded into a circle, their heads forming the centre. During the market hours the intersecting streets are closed.

The market belongs to the corporation, and is held by prescription, charters, and acts of Parliament. The city of London "has been seized in fee of its ancient market, from time whereof the memory of man runneth not to the contrary." There are two weekly market days for live stock—Monday and Friday; and three for hay and straw, Tuesday, Thursday, and Saturday. Cattle sales commence about day-light in winter, and 5 o'clock A.M. in summer, and are generally over by 3 o'clock P.M., when the market closes. On Friday milk cows are sold, after which a horse and donkey fair commences.

The government of the market is under the corporation, whose officers are a collector or clerk, an inspector, and a sergeant and small staff of police. The duty of the clerk is to grant licenses, space in the different departments of the market to salesmen and graziers, and to receive and account to the city chamberlain for all monies arising from tolls, dues, licenses, fines, &c. The duties of the inspector are, to examine the soundness of the stock, and to cause the removal of diseased beasts. And the duty of the police is to see the bye-laws of the market duly attended to by all parties. The principal parties connected with, and attending the market, are seven banking or money-taking houses, 600 salesmen, about 4000 butchers, and 950 licensed drovers. The "money-takers" co-operate with salesmen, discharging their pecuniary duties by receiving from butchers the amount of their purchases, by remitting to the provinces the proceeds of sales, by paying the tolls and dues on stock to the collector, and so forth, for which they charge 6*d.* for every bullock, 4*d.* for every calf, and 1*s.* 4*d.* for every score of sheep, 1*d.* for single heads over the score. Drovers are of two orders—"masters" and "men;" the former get their instructions from salesmen, and receive at the different railway termini, and of country drovers, cattle—take them to lairs, and to the market—and, when sold, deliver them to butchers, for which they have 6*d.* per bullock. The tolls and dues of the market come also out of the commission of salesmen, which is 3*s.* 6*d.* per head of cattle in some provinces, and 4*s.* in others, according to ancient custom—the latter being the most general; sheep from 6*d.* to 3*d.* per head.

The lairage of the market, principally the property of salesmen, and situated in the suburbs, forms part of the same commercial fabric—for here cattle are fed, examined, and sorted for Smithfield: on the ox arriving at these lairs it receives abundance of water, and 14 lbs. of hay for the night, the common allowance being a truss among four beasts, for which the owner is charged 1*s.*—3*d.* for the lair, and 9*d.* for hay, including attendance. Salesmen for the sake of order generally occupy the same standings in the market: and, on the day previous to it, have to apply for them, stating the number of head each requires room for, when orders of admission are received from the clerk. On the ox arriving in the market ground, it is driven up to the rail, when a drover in front throws a lasso, or rope with a running noose, around its neck, pulling it tight and making it fast. In this manner ox after ox is tied up, so long as one can be wedged up between other two; when this is no longer practicable, the goading into "ring droves" commences. When sold, it is driven to the lair of the butcher—sometimes his own property, sometimes not. A large proportion of purchases are handed over to slaughtermen, who charge from 3*s.* to 4*s.* per ox for slaughtering and delivering the carcass to the butcher. In the sheep and pig department, practice is of a kindred character.

The commerce of Smithfield is also inseparable from that of the dead meat markets of Newgate and Leadenhall; for not less than 1200 beasts are weekly bought in Smithfield, with an equal proportion of sheep, calves, and pigs, to supply the demand of the latter.

Newgate and Leadenhall markets are held daily under the government of the Corporation; and the amount of business in both, but especially the former, has greatly overgrown the market buildings. In 1848, the number of salesmen in Newgate was about 200, while forty years previously it was only thirteen. In Leadenhall there are "about twenty meat, and twelve poultry salesmen." Their commission is 1*d.* per stone on beef, and about the same for other descriptions of meat—or from 8*d.* to 9*d.*, and upwards, for each sheep or lamb; calves, 1*s.* 6*d.* to 2*s.* The officers of the markets are a collector and beadle.

In neither market can any account be had of the quantity of meat annually sold, none being kept; but in 1848, independently of the above supply of live stock, the different railway companies "pitched into Newgate about 800 tons weekly on an average." The annual value of the total sales in this market, at this period, was estimated at upwards of 3,837,600*l.*, and since then an increase has taken place.

Mr. Hicks, a carcass salesman, and member of common council, in his evidence before a Committee of the House of Commons, in 1849, gives the following result:—It is obtained from the account of sales of ten salesmen of cattle and sheep, for one week in May, August, and December, for three years; namely, 5579 head of cattle sold at upwards of 21*l.* each, and 8600 sheep at 42*s.* 6*d.* each—and from it he deduces the following as the annual value of stock sold in Smithfield, making as a necessary allowance for inferior quality a reduction of 50*s.* a head on the average value of the cattle, and 4*s.* 6*d.* a head on the average value of the sheep:—

224,000 beasts, at 18*l.* 10*s.*	=	£3,144,000
1,550,000 sheep, at 1*l.* 18*s.*	=	2,945,000
27,000 calves, at 3*l.* 15*s.*	=	102,375
40,000 pigs, at 1*l.* 10*s.*	=	60,000
Annual proceeds of sales ...		£7,251,375

Mr. Giblett, a butcher, gives, per head—beasts, 16*l.*; sheep, 35*s.*; calves, 80*s.*; and pigs, 40*s.* The clerk of the market—beasts, 17*l.* 5*s.*; sheep, 36*s.* 6*d.*; calves, 77*s.* 6*d.*; and pigs, 35*s.* The latter also gives the following sales for 1848:—

Horses	12,867 head
Hay	18,537 loads
Straw	1,751 ,,

In 1847 there appears to have been in the market 7641 milk cows; and, in 1848, 6630, making an average of about 140 weekly—a return exceeding that of 1851. The cow and horse markets, however, afford no index to the general supply and demand of the metropolis, for the principal dairymen get their cows direct from the country, and horses come from the same quarter, *viâ* Tattersall's, &c. The show in Smithfield of this stock is little more than the offscourings of the London dairies and livery stables, &c.

No toll or charge is made on donkeys, and hence no account of numbers is kept; the traffic, however, is by no means unworthy of notice. With the assistance of one of the market police, we numbered one day, within the avenues allotted for them, 120 within the area of the market. By this time several juvenile buyers had left the market, proud of their purchases, while as many more were hurrying to it to get rid of bad bargains—so that from this and other sources, we arrive at the conclusion that cows and donkeys stand upon a footing of equality as to numbers—there being a weekly supply of about 140, and an annual of from 6000 to 7000 each.

The present tolls and dues in Smithfield are as follows:

TOLLS—Sheep—For every score of sheep sold, 2*d.* per score.
Beasts—For every score of beasts sold, 20*d.* per score.
Horses—For every entry of sale, 4*d.* each.
Pigs—For every score, 4*d.*
DUES—Pens for sheep, calves, or pigs—Permanent pens, 1*s.* each.
Ties for beasts or calves, 1*d.* each—for horses, 2*d.* each.
Hay duty, 6*d.* per load—and for each entry of sale, 1*d.*
Straw duty, 1*d.* per load—and for each entry of sale, 1*d.*
DROVERS pay 5*s.* for a license, and 1*s.* annually for renewal.

In Newgate market the Corporation is entitled to "a toll of 1*d.* for every hamper—2*d.* for every bundle—and 6*d.* for every pack of meat brought into the market—and 1*d.* for every coop of poultry—and the same for every lot of butter and eggs; but these tolls have been commuted for a fixed weekly payment, which is received of those who are tenants in the original market." In Leadenhall the same has taken place; in both, a weekly rent is charged for every stall.—*Agricultural Cyclopædia*, Article MARKETS.

[In 1853 there were sold in Smithfield 294,571 oxen, 1,518,040 sheep, 36,791 calves, and 29,593 pigs.

The total sale of meat, dead and alive, for London consumption, is estimated at 483,388 oxen, 2,141,393 sheep, 132,976 calves, 159,052 pigs.]

ON THE GROWTH OF MANGOLD WURZEL.

By PROFESSOR J. BUCKMAN.

WHEN Mangold Wurzel was first introduced into farm cultivation, its great recommendation seems to have been that while its roots contained a large quantity of succulent and nutritive matter, suitable for all kinds of stock, its leaves were no less valuable for feeding purposes, so that its growth was advocated much upon the supposed grounds of a capability for simultaneously producing two crops. Experience has, however, long since taught us that though the Mangold be a plant yielding a large amount of produce when properly cultivated, yet that, by endeavouring to obtain too much, we in reality get less, and this is confirmed by direct experiment. Hence the author of "Practical Agriculture," fifty years since, made the following remarks:—

"It is probable that, upon the whole, the root has neither been found to be equal in quality, as a cattle food, or to afford the quantity of produce that was supposed on its first introduction."* Now this becomes perfectly intelligible when, as we learn from the 'Annals of Agriculture" for the same period:—

"The plants seem to have afforded a large produce of leaves when gathered every two or three days, from July till late in September, yet the whole produce in leaves and roots is not equal to that of the large Cabbage." Such is the experience of 50 years since, and yet after a lapse of half a century we find Mangold Wurzel extensively cultivated, and its root is demonstrated alike by practical experience and scientific investigation to afford a highly valuable because eminently nutritious crop. The reason, therefore, of this discrepancy of opinion, and its resulting increase of growth in modern times, must be sought for in the fact of an improvement in management, the most important change being that of non-mutilation. We now care not for the leaves, and, as will be shown in the sequel, we therefore obtain not only a larger quantity of the root, but this is improved in its nutritive capabilities. That the root is injured in its growth by depriving the plants of their leaves will be at once gathered from the following experiments, which were instituted on purpose to obtain evidence on this very point.

In May of the past year were sown five sorts of Mangold Wurzel; two rows of each were ridged and cultivated in exactly the same manner as those in the farm, and the ground for the whole prepared alike. When, however, the roots had attained the size of about 1½ inches in diameter, a single row of each sort was closely stripped of all the outward leaves by carefully cutting them away with a sharp knife so as not to produce injury by tearing, a process which was from time to time repeated as often as the outer leaves had again attained to a size to be used as a feeding matter. The result of this treatment was as under, weighed in November, 1854.

Sorts of Mangold Wurzel.	Leaves intact.	Leaves cut.
1. Red Globe	31.0	23.5
2. Yellow Globe	45.0	18.5
3. Long Red	49.0	18.0
4. Long Yellow	35.5	18.0
5. Long White	32.5	19.5
Total for the five sorts ...	193.0	97.5

Here it may be noticed that the resulting produce of the uncut when compared with the cut plants, in an average of five sorts, is within a fraction of two to one, or nearly double, and it will be seen that while the Yellow Globe and the Long Red when uninjured have produced the largest crops yet that they suffered proportionably more from mutilation; in each case less than half the amount of root resulting from the injured, when compared with the uninjured. These experiments, therefore, while they show the effects as far as the roots are concerned of destroying the leaves, fully justify the favour in which the Long Red and Yellow Globe Mangold are held, at the same time making it appear that those kinds which yield the largest return if rightly cultivated, are just the ones that suffer most from an opposite method. Having now shown a diminution of the crop to result from injury to the leaves, I go on to furnish evidence to prove that even this smaller amount is at the same time deteriorated in quality. Upon this head it would be sufficient to notice that the practical farmer was dissatisfied with the cultivation of the Mangold Wurzel while the vicious system prevailed, the reasons for which, however, have been amply proved by experiment and chemical investigation. In a report of "experiments made by Dr. Wolff, Professor of Chemistry in the Royal Agricultural College of Hohenheim, in Wurtemberg," published at Leipsic during the preceding year, we learn that two sorts of Mangold Wurzel were grown, namely, the Globe and Long Red varieties, from which the leaves were taken off for feeding purposes in September and again in October, and the result of twice stripping the plants of their leaves was a diminution in produce amounting to one-fifth; it is therefore no wonder that four or five times stripping off the leaves should diminish the produce of root one-half, as in my own experiment, still less that the gathering of the leaves every two or three days, from July until late in September, should have caused this useful plant to be slightingly spoken of 50 years since.

As in my own experiments those of Dr. Wolff show that the amount of root suffers greatly when the leaves are removed, but this is not all; for chemical analyses of the root where the leaves were intact, when compared with those in which the leaves were taken off, make it evident that not only is there a diminution in quantity, but a deterioration in quality of the latter — facts which will be explained by the following table of the composition of two varieties of Mangold Wurzel in two methods of growth in the fresh state:—

	1. Globe variety.		2. Long variety.	
	Leaves taken off	Leaves intact.	Leaves taken off	Leaves intact.
Woody fibre	0.869	0.843	0.936	1.004
Ash	1.010	1.050	0.943	1.125
Sugar	5.076	6.183	4.594	5.365
Pectin, Gum, &c.	2.605	1.090	3.201	4.024
Protein Compounds ...	.937	1.019	0.772	1.000
Water	89.494	89.815	89.554	87.482
	100.000	100.000	100.000	100.000

Now, in this table we cannot help remarking upon the great increase in those important feeding elements, sugar, and protein or nitrogeous substances, matters, it may be presumed, which would be still farther lessened by a greater denudation of such important plant-organs as the leaves.

However, in estimating the good or injury which finally results from the plan of growth commented upon, it may be a matter for consideration as to whether the leaves in their value counterbalance the injury to the roots, as it is quite evident we cannot get the leaves into the bargain of a good crop of roots; and here I would remark, that I think the value of the leaves as a feeding stuff has been much over-rated, and this is confirmed by Dr. Wolff's experiments, who also adds that the leaves are very apt to produce diarrhœa in cattle. The following table from this author gives the result of experiments to test the qualities of milk as obtained from cows fed with aftermath, as compared with feeding from Mangold leaves.

Composition of milk in these cows:—

	1.	2.	3.
A. Principal Food Aftermath.			
Dry substance	12.47	12.49	11.39
Water	87.53	87.51	88.62
Butter in Milk	3.13	3.39	2.53
B. Principal Food Mangold Leaves.			
Dry substance	11.30	12.08	11.04
Water	88.70	87.42	88.96
Butter in Milk	2.60	2.88	2.20

These results show a large decrease of an important constituent of milk, namely butter, from which we may conclude that the plan of using Mangold Wurzel leaves is by no means satisfactory in dairies, where it has been specially recommended.

Here, then, to sum up our conclusions upon what we may term the economics of Mangold Wurzel growing, and leaving out all reference to the physiology of the question, the case will stand as follows:—1st. The leaves of Mangold Wurzel cannot be systematically taken from the growing plant without lessening the quantity of roots in proportion to the closeness with which the operation is performed. 2d. The decreased quantity of roots does not yield so large a percentage of nutritive matter as are contained in those that are uninjured; and 3d. This injury to the roots is by no means counterbalanced in quantity or quality by any value that we might attach to the leaves.

* Quoted from the "Complete Farmer," 1807.

TITHE COMMUTATION AVERAGES.

As your readers may feel anxious to know the result of the corn averages for the seven years to Christmas last, published in the *London Gazette* of 5th inst., viz.:

Wheat	6s. 0¾d.	per imperial bushel.
Barley	3 7¾	" "
Oats	2 6	" "

I beg to state for their information that each 100*l.* of the Tithe Rent Charge will, for the year 1855, amount to 89*l.* 15*s.* 8¾*d.*, which is a reduction of 1*l.* 3*s.* 8¼*d.* from last year's value. The following statement from my "Annual Tithe Commutation Tables" will show the worth of 100*l.* of tithe rent charges for each year, since the passing of the Tithe Commutation Act, viz.:

For the year 1837	£98	13s.	9¾d.
" 1838	97	7	11
" 1839	95	7	9
" 1840	98	15	9¼
" 1841	102	12	5¼
" 1842	105	8	2¾
" 1843	105	12	2¼
" 1844	104	3	5¼
" 1845	103	17	11¼
" 1846	102	17	8¾
" 1847	99	18	10¼
" 1848	102	1	0
" 1849	100	3	7¾
" 1850	98	16	10
" 1851	96	11	4¾
" 1852	93	16	11¼
" 1853	91	13	5¾
" 1854	90	19	5
" 1855	89	15	8¾
19)	1878	14	6¼
General Average for 19 years ...	£98	17	7¼

Charles M. Willich, Actuary to the University Life Office, 25, Suffolk Street, Pall Mall, 8th January, 1855.

THE SHROPSHIRE SHEEP.

[The following paper is abridged from the columns of the *Midland Counties Herald.*]

DURING the last few years much interest has been excited amongst agriculturists respecting a breed of sheep which had been for some time previously common to the county of Salop, and to some extent to the adjoining counties of Stafford, Worcester, and Warwick, and which is now become well known throughout the United Kingdom. They are called "Shropshire sheep"—a name which appears to be finally settled, as it is adopted by many of the principal breeders—the term "Shropshire Downs" being inappropriate, and only calculated to mislead. The latter designation would indicate a small and delicate variety, while the former is intended to apply to one of a larger and more robust character; precisely what is generally required.

It is not our purpose to enter upon a discussion as to the precise course which has been followed in producing the improved Shropshire sheep, as such an inquiry would now possess but little, if any, practical value. The generally received opinion is no doubt the correct one, namely, that the example of Ellman with the South Downs has been followed by breeders in Salop, who had as a foundation the very excellent breed of sheep which is known to have existed in that county for many centuries, and who have taken judicious means, while preserving the fine quality for which the breed was always distinguished, to obtain a larger frame and increased aptitude to fatten. The questions which purchasers have to consider, and which have no doubt attracted their attention, are these—have the breeders of this stock succeeded in obtaining purity of type? and can its present characteristics be perpetuated? As tests of the estimation in which the breed is held, we append the following list of sales during the past year.

The annual sale of sheep bred by W. O. Foster, Esq., took place at Kinfare Hill Farm, near Stourbridge, on the 30th of July. The following are some of the prices realised:—

SHEARLING RAMS.

	£.	s.	d.		
No. 1	31	10	0	... ...	Lord Wenlock.
2	27	6	0	... ...	Mr. Somner.
3	11	0	6	... ...	Mr. W. M. Bill.
4	16	16	0	... ...	Mr. Edwards.
5	9	10	0	... ...	Mr. W. M. Bill.
6	19	19	0	... ...	Mr. Preece, auctioneer.
7	13	13	0	... ...	Mr. Herbert.
8	12	0	0	... ...	Mr. Clayton.
9	9	10	0	... ...	Mr. Williams.
16	18	18	0	... ...	Mr. Farmer.
17	10	10	0	... ...	Mr. Fletcher.

25 sheep at 10 6 11 each.

FIVE SHEARLING EWES.

No. 1	4	16	0	each ...	Mr. Clarke.
2	4	16	0	" ...	Mr. Moore.
3	4	4	0	" ...	Mr. Fletcher.
4	4	16	0	" ...	Mr. Garlick.
5	3	16	0	" ...	Mr. Smith.
6	4	16	0	" ...	Mr. Clarke.

£136 0 0, or 4*l.* 10*s.* 8*d.* per head.

FIVE STOCK EWES.

No. 1	5	5	0	each ...	Mr. Fletcher.
2	4	0	0	" ...	Mr. Williams.
3	4	16	0	" ...	Mr. Fletcher.
4	3	12	0	" ...	Mr. Clarke.
5	4	0	0	" ...	Mr. Fletcher.
6	3	12	0	" ...	Mr. Clarke.

£126 5 0, or 4*l.* 4*s.* 2*d.* per head.

The seventh annual sale of Shropshire sheep, the property of the Earl of Aylesford, was held at the farm, Meriden Heath, by Messrs. Brown and Clarke, on the 4th of September, when 31 shear-hog, and 9 two and three-shear rams, and 200 store ewes and theaves, were disposed of. A two-shear ram was purchased for Lord Willoughby at 15*l.*; another of the same age realised 12*l.* 10*s.*; and a three-shear ram, 10*l.* Of the shearling rams, the highest price was 11*l.* 10*s.*, the purchaser being Mr. Docker, of Allesley. Of the ewes, four pens were purchased for the Hon. A. H. Vernon, of Sudbury, at 76*s.*, 60*s*, and 50*s.* per head.

Mr. Preece, the auctioneer of Shrewsbury, has supplied the following information:—"At the Shropshire Great Ram Fair, on the 25th July, 20 rams, bred by Thomas Juckes, Esq., averaged 16*l.* each. All were sold, the highest price being 33*l.* 12*s*, and the lowest 11*l.* 11*s.* Twelve rams, bred by the Messrs. Crane, of Shrawardine, averaged nearly 12*l.* each, all being sold; highest price, 19*l.* 19*s.*; lowest ditto, 6*l.* 16*s.* 6*d.* Fifty draft ewes, bred by the Messrs. Crane, realised 290*l.* 10*s.*, an average of 6*l.* each, less 10*s.* The principal part of the ewes were bought to go into Lancashire, Gloucestershire, and Warwickshire. There were at this fair sold by me about 30 other rams, belonging to Messrs. Minton, Farmer, Haughton, Peckstock, and Claridge, at prices ranging from five to fourteen guineas.

At Mr. Masfen's sale, at Norton Caines, near Walsall, 30 rams were sold, on the 1st of August, at an average of 11*l.* 10*s.* each, all being disposed of. Highest price, 20*l.*; lowest ditto, 6*l.*

Mr. Adney's (of Harley) sale took place August 7th, when 27 rams were sold at an average of 13*l.* 10*s.* each; and 100 draft ewes, at an average of 3*l.* 18*s.* each; some pens making 5*l.* 10*s.* each. At the late Shropshire Cattle Show, Mr. Adney's original Shropshire ram won the Champion Sweepstakes for the best ram of any age or breed, beating Mr. Horton's celebrated Shropshire ram, which won the prize at the Gloucester meeting of the Royal Agricultural Society of England, and several others of the distinct South Down, Leicester, and Shropshire breeds.

At Mr. Horton's (of Harnage) the highest-priced ram was 33*l.* 12*s.*, bought by Col. Pennant, of Penrhyn Castle; and the lowest price obtained was 9*l.* The ewes (130 drafts) averaged 3*l.* each, the highest pen making 5*l.* 10*s.* each.

Mr. Bach offered a considerable number of Shropshire sheep (the property of different breeders) for sale by auction, at Ludlow Fair, on the 19th of August. Yearlings were in the greatest request, and those of Messrs. James Hand, Edward Urwick, and R. Bach

averaged over 10*l.* each, few remaining at the close of the sale unsold.

On the 18th of August, Messrs. Nock and Wilson held a sale of Shropshire sheep, at Marlow Lodge, Leintwardine, the property of J. B. Green, Esq. Some of the rams sold at 10, 15, 17, 18, and 20 guineas each; while others were let for the season at 10*l.*, 12*l.*, and 15*l.* each. The ewes realised 48*s.*, 55*s.*, and 56*s.* each.

Messrs. Nock and Wilson also held the annual sale of Shropshire sheep, the property of the Earl of Dartmouth, at Patshull, on the 8th of September, when several pens of 10 ewes were sold at 40*s.*, 47*s.*, 53*s.*, and 66*s.* each.

We understand that in the month of October last, Mr. Thomas Lloyd Roberts, of Langley Farm, Bromfield, Salop, sold 15 yearling Shropshire rams at an average of 19*l.* each, and a number of draft ewes at an average of 5*l.* each. The same gentleman also sold to one breeder 10 ewes and one yearling ram for 150*l.*; the ram for 50*l.*, and the ewes at 10*l.* each.

Higher prices than those mentioned above have been obtained in isolated cases in former years; but these returns will show that the sales last year were more generally successful, although greater numbers were offered for competition than heretofore. We trust that the information we have now supplied will have the effect of directing still further attention to the useful character of this breed of sheep.

Home Correspondence.

The Irish Flax Trade.—In your impression of 13th inst., reviewing Mr. Locke's essay, entitled "Ireland's Recovery," I observe the following passage:—"Ireland, so anomalous in many things, gives an instance of the national characteristic, in the fact that in the last year she exported about 5000 tons of Flax (at 58*l.* per ton), with tow and yarn, and imported nearly 9000 tons, at 65*l.* per ton. The yarn exported was valued at 105*l.* per ton, whereas the imported (less than that exported) was valued at 180*l.* per ton. This would seem to indicate superior skill elsewhere in the spinning of fine yarns, or inferiority in the quality of the native raw material itself for the manufacture of some of the finer linens." This paragraph having been evidently penned by one unacquainted with the circumstances of our staple manufacture, should not remain without some explanation, which, I trust, you will give me space in your columns to make. There may be many anomalies in the Irish national character, but I can safely affirm that the linen manufacture exhibits no feature which will not redound to the credit of the people of Ulster, both as regards their manufacturing skill and their commercial shrewdness and activity. The reason why we export 5000 tons of Flax, at an average value of 58*l.* per ton, and import 9000 tons at an average value of 65*l.* per ton is simply because the home-grown fibre, while the best in the world for the large range of medium qualities of linen, is neither so coarse as the Russian, nor so fine (except in certain districts) as the Belgian. Hence, to make heavy fabrics, we must buy the former, and to make fine lawns and cambrics we must procure the latter. And because Irish Flax is the best material for medium fabrics, the English and Scotch spinners, and, to some extent also, the French and Belgian, purchase it in our markets. As respects Irish yarn exported, and valued at 105*l.* per ton, while Ireland imports yarn valued at 180*l.*, the explanation is again simple. It is well known that of a given number of districts occupied in the same branch of manufacture scarcely two make the same article; each applies itself to one particular description of the fabric and attains much greater perfection in it than if a range of fabrics of different textures were made. Thus, the great bulk of Irish spinners make the medium Nos. of yarn, the Scotch spin the heavy and coarse Nos., and the English the finer Nos. Some of the Irish spinners make yarns equally fine with the latter, and their quality is admitted to be unexcelled. But as they are the exceptions to the general rule of medium spinning, the Irish manufacturers must naturally have recourse to England for the yarns they require for the lighter and finer fabrics, and for the finest cambrics they must procure the delicate hand-spun yarns of Westphalia and French Flanders, which are very costly. The Irish yarns exported represent, of course, the quality generally spun in Ireland, while the imported yarns, consisting almost exclusively of the finer Nos., raise the average value above that of the exported. In whatever way the Irish linen manufacture be examined it will be found to occupy the first place, not only as compared with the foreign linen manufacture, but with that of Great Britain. *Jas. MacAdam, jun., Belfast, Jan.* 16.

Cross-bred Mountain Sheep.—Without entering into any formal reply to the scientific inductions of "T.," p. 26, perhaps it will be sufficient for me to state that my friend had no cause for complaint on the score of the parturition of his ewes, but on the contrary was so well satisfied with his experiment that this year he has considerably increased the number. I cannot admit that it follows as a natural consequence that a large male must necessarily cause a large offspring and difficulty at the time of birth. On the contrary, reasoning from my own experience, I believe the feeding or nursing properties of the mother have more to do with the size of the young prior to birth than the male from which they have proceeded. Of this there are numerous examples, familiar to every one, as the small breeds of Guernsey or Kerry cows with a Durham bull, an ass with a large horse, lap-dogs with a Newfoundland male, all these being instances where though the ultimate result may be a large animal, the difficulties at the time of parturition form the exception rather than the rule;—in fact the male has little to do with the size of the young during the time of gestation; he may impress his size, colour, and constitutional peculiarities upon the animal, but the size which it will attain prior to birth depends almost exclusively upon the feeding properties of the mother. Apart from all considerations of the male, fat cows and small calves, fat women and small children, lean cows and large calves, lean women and fat children, are examples of daily occurrence. Neither do I believe that high feeding has any influence, except an evil one, upon the size of the offspring, for I could cite an instance of a large dairy of cows stuffed daily with Turnips, oilcake, and Linseed mash, which produced a lot of poor nasty calves, whilst other cows, taking their luck in the straw yard, produced comparatively first-rate calves. Look, again, at the puny offspring of many of our high and middle classes, as compared with the fat, ruddy, chubby, hardy children of the half-starved and hardly worked peasantry of England and Ireland, and especially of Wales, and here is further proof that underfeeding is better than pampering. In the example which "T." cites of his own want of success, perhaps his stock suffered as much from their predatory habits, received positive injury thereby, as from being put to a large male. I grant all he says against the mountain breed, they are especially in inclosed districts a perfect nuisance; but even that does not "kick the beam" against the fine quality of their mutton, especially when that mutton is formed among the sweet herbs and their mountain Heather. Of "T.'s" argument in favour of in-and-in breeding, I may remark, that by such a course he may get fine quality and high feeding properties, and great aptitude under careful management to lay on meat; but most assuredly the constitution will deteriorate, and if obliged to "rough it," animals so finely bred will not do to compare with their more plebeian brethren. I know an instance where cows were bred in-and-in until they ceased to yield milk sufficient to support their calves, and a few weeks after calving would go quite dry; still they were always fat, and fat they would be even in the straw-yard. In conclusion, however, I may remark that, in speaking of putting mountain ewes to a large ram, I spoke comparatively of Welsh as compared with English farming, or good ordinary Southdowns, such as are seen in Wales, and not of the prize animals of Goodwood and other places in this country. *W. P. Ayres, Whittlebury Lodge, Jan.* 15.

Lord Faversham's Ox at Birmingham.—If I had known that you would have published the weights of the beasts shown at Birmingham, I would also have sent you the weight of the white ox (short-horn) shown at Birmingham, and fed by the Right Hon. Lord Faversham, of Duncombe Park, in this county. The particulars are as follows:—

Live Weight of the Ox:—162 Imperial Stones Measure.

Length.	Girth.	Carcase.	Loose Fat.
		Actual Weight.	
feet inch.	feet in.	st. lbs.	st. lbs.
6 0	8 8	108 5½	16 13¼

I should have liked this to have appeared in your Paper, as it appears his lordship's ox had more loose fat than any beast shown either at Baker Street or Birmingham except No. 32, which had 17 stone. *Walter Taylor, Malton, Yorkshire.*

Payne's Defiance Wheat.—Mr. Mechi asks of your correspondents whether the value of Payne's Defiance Revitt Wheat is, as a rule, 10*s.* per quarter below other Wheats. I have grown it for two years, and the millers who buy nearly all my corn, and they are perhaps doing the largest business in the county, have always considered that, weight for weight, the Revitt is 5*s.* per coomb under value. This, coupled with the fact that I cannot grow a larger acreable yield than of the old sorts—Spalding, for instance—has led me to eschew the growth of Revitts for the future. *T. R. Ellis, Oxnead Hall, Buxton, Norfolk.*

Gorse.—In your answer to "a Constant Reader," January 8, there are several points in which I think you have not had perhaps experience in Gorse feeding. I will state them as briefly as I can. The common Ulex europæus is the best in every point of view, both in quality, quantity, and hardihood, even if the immense trouble and expense of growing U. strictus was not sufficient bar to its introduction. The sowing directions are very good. The plan, however, of cutting the alternate rows annually is very bad. If the soil it is grown on is sandy you may cut it every year; but if not well qualified for Gorse, every other year. But instead of cutting the alternate rows in the troublesome manner you mention, mow half your plot each year with a scythe, and simply rake it up as you would any green crop. The expense and trouble of this is no more than so much Lucerne, &c. By mowing regularly you save all the expense of separating woody stems, as there will be none. The mallet and block is very well for a poor cottager with one or two cows; but to use Gorse upon a large scale, as it ought to be on all light sandy soils, as one of the very best and cheapest foods for cattle, horses, and sheep through eight months in the year, get a good strong chaff-cutter that will cut half-inch chaff (I find Ransome and Parsons, of Salford, the best I know). If with a horse-power attached, this will cut up a good cart load in a very short time once over, the man feeding having gloves on. Then lay straw on the feeder, and put the once chopped Gorse upon it with a shovel; the straw pulls it on, and it gets quite as much cut and bruised as is useful for horses, cows, calves, and sheep. I think no one who fairly tries this plan will ever give it up again. I should much like to see a light sand farm of say 200 acres well cultivated, and with sufficient capital for boxes, &c., farmed so as to have 160 acres corn and green crops, and the 40 worst of Gorse. The number of stock it would keep profitably, if in boxes all the year, would be very great. I began by saying I would be brief; but I have made a sad long story of it I fear. It may be useful, however, to your "Constant Reader." *W. D. F.*

Law Expenses.—I have lately purchased some hill land, to the purchase of which no objection was made by any one, the title as clear as part ownership is in England. The sum amounted to 480*l.*; the law expenses for this 480*l.* were 74*l.*! *John Ay, Winscombe.*

Chronicles of a Clay Farm.—I have lately been rereading this work, which is well worthy the attention of all interested in agriculture, whether landlord, tenant, or implement maker. I think Mr. Hoskyns is on the right track when he says that steam cultivation must be done by a cylinder of claws revolving independently of the draught, and there is little doubt that it will some day be accomplished; but as yet I fancy the weight of the engine, if constructed as portable engines and locomotives now are, would be so great as to prevent its working, except, perhaps, when the ground is very hard. Supposing that it takes as much power to cut up a breadth of 9 inches of soil into a fine mould, as it does to turn over a furrow of that width (and I do not think you can allow less), then, if the cylinder were 6 feet wide it would require 16-horse power, viz., two to every 9 inches. It is pretty good work for three horses to draw a seven-horse power portable engine along a road, and I do not think six horses power would be more than sufficient to move so heavy a machine along a stubble field; we have then a 22-horse power engine besides the revolver—how is such a cumbrous affair to be turned short round each time it arrives at the end of a field? Of the expense I say nothing, as I think if it can once be accomplished the cost may be reduced afterwards. I must apologise for trespassing so much on your space; but being interested in agriculture, I am anxious to know if Mr. Hoskyns can overcome the difficulty I have mentioned, and I have no means of communicating with him but through your columns. *A Farmer in Embryo.* [The difficulty to which you allude has long been the acknowledged hindrance to the progress of steam culture.]

Societies.

Highland and Agricultural.—At the late half-yearly general meeting of this Society, the Duke of Buccleuch in the chair, 78 new members, 49 of whom are tenant-farmers, were elected.

Agricultural Statistics.—Sir John M'Neill said he had the pleasure of reporting to the society what might be considered as the completion of the inquiry, and he might state with confidence that in no part of the United Kingdom had there yet been collected a body of agricultural statistics so worthy of trust or so complete as those which had now, through the instrumentality of the Highland Society, been collected for Scotland. While congratulating the Society upon their success, he did not mean at all to assert that the returns which had this year been obtained were complete and perfect. There were, necessarily, some defects for which they were not responsible. He might instance the fact of the impossibility of giving the entire area of the country from the want of such a survey as would alone enable them to do it with accuracy; but when they had obtained a trigonometrical survey of Scotland, they would be able to give returns complete as regarded the area. There was another imperfection also in the returns, which was not likely to occur again. To obtain accurate returns of stock in all parts of the country it was necessary to follow the same system which was adopted in enumerating the population—to take the numbers upon one day. But from the late season at which the authority was given, and from the difficulty of obtaining correct returns of occupants, it was impossible to accomplish that this year. The tables would be forwarded to the Board of Trade, and he trusted that the board would have no objection to publicity being immediately given to the results thus obtained. He thought the tenant farmers who had laboured so zealously in the matter were entitled to the immediate benefit of the Scotch tables.

The Duke of Buccleuch said they were deeply indebted to the gentlemen who had acted as enumerators in the different districts. They had done their duty in a most excellent manner. But he should be doing an injustice to the position he held as their chairman, and also to his position as a member of the society, if he did not express most distinctly his own individual opinion, and, he was sure, the opinion of every one, of the invaluable services which had been rendered to them by their secretary, Mr. Hall Maxwell. His labours had been labours of love—purely gratuitous, and highly honourable to himself. He thought they could not do less than pass a vote of thanks to Mr. Maxwell for the manner in which he had conducted the inquiry (cheers).—Lord Panmure thought they should also bear a public testimony to the zeal of the tenantry of Scotland, through whom alone these statistics could have been furnished. He concluded by seconding the proposition to give a vote of thanks to the secretary for his zeal in conducting the investigation. The motion having been unanimously adopted, Mr. Maxwell returned thanks.

The Chemical Department.—Dr. Anderson reported that continued progress was being made in this department. They had just completed a very extensive inves-

ation into the composition of a great variety of oilcakes, and this would shortly be laid before the society. They had also been investigating the composition of oilcake made from the earth-nut in France, and which seemed likely to be of considerable importance; and they had been engaged in determining the properties of soils, &c. As regarded analyses made for individuals, the number of these during the past half year had been larger than was usual during the latter half of the year, when farmers were occupied with other matters. It was interesting to observe that the character of these analyses was undergoing some change. During the last year the analyses of superphosphates had very largely increased, the use of superphosphates being greatly on the advance in Scotland. When he first became chemist to the society, these analyses were somewhat of a rarity, but the case was now very different, and, while formerly they had been of an inferior character, the quality had now greatly improved. The report was approved of.

The Inverness Show. Mr. Maxwell stated that arrangements had been made for holding the next show at Inverness, in 1856, and that a list of the classes of stock was now before the local committee, of which Lord Lovat had undertaken to act as chairman. Mr. Maxwell added that the society would meet in Glasgow in 1857, and that there was an application from Aberdeen for 1858.

Farmers' Clubs.

LONDON.—The following have been selected as subjects for discussion during the present year:—

	Proposed by
February 5.—To what extent can Town Sewage be profitably applied to the purposes of Agriculture?	Mr. J. J. MECHI, of Tiptree Hall, Essex.
March 5.—The Cultivation of Italian Rye-grass	Mr. J. C. MORTON, of Upper Wellington Street, London.
April 2.—The most economical mode of Cultivating Root Crops	Mr. W. BENNETT, of Cambridge.
May 7.—On the general application of Steam Power to Agricultural Purposes, and, if practicable, what would be its natural results?	Mr. J. WILLIAMS, of Baydon, Wilts.
June 4.—On the Economy and Cost of Good Roads	Mr. J. BAILEY DENTON, of Stevenage, Herts.
November 5.—The best system of Stall-feeding Cattle—particularly on Farms chiefly Arable, and where Economy in the Consumption of Hay, or its entire omission in the process is an important consideration	Mr. OWEN WALLIS, of Overstone Grange, Northampton.
December.—Upon the Management of Estates so as to insure their utmost Development and Improvement	Mr. R. BAKER, of Writtle, Essex.

The discussions commence at half-past 5 o'clock. There are no meetings for discussion in January, July, August, September, or October.

Notices to Correspondents.

BUSHEL OF WHEAT: *A Northern.* The cost of a bushel of Wheat is what no two men will agree upon; the preliminaries to a discussion of that point need themselves to be discussed, and this we hope shortly to do.

COVERED YARDS: *An Anonymous Correspondent* calls the attention of our readers to this subject, and we shall be much obliged for information on it from any one who can speak from experience. He asks for "reliable information as to the construction of covered yards for manure. He does not refer to homesteads under one roof.) On how many sides should there be walls, and with what openings? What height should the wall plates be from the ground to allow for the manure and young stock kept in the yard? What is the best arrangement for troughs for feeding the stock, so as not to be interfered with by the manure? What is the best and cheapest form and span of roof to cover such a space, say a square of 60 feet or upwards? Should there be any arrangements for light or air in the roof? Any information on this subject, or indication where it can be got will oblige. Also as to where practical information can be got as to cast-iron pipes for liquid manure. Can the system be worked without machinery in 3-inch pipes, where there is a small fall, say under 10 feet? Would it answer simply pumping up the liquid manure into a small supply tank from the larger one below, so as to give a fall of the height mentioned above? Distribution of liquid manure by gravity is spoken of in some of the papers on the subject, but as far as appears this is only by open channels like water gutters, for no mention is made of pipes distributing by gravity, without steam-engine or horse-gear." Distribution by gravity is generally mere surface distribution, but it may be by pipes if the position of the buildings be high enough above the land to be so treated. It is plain that the pressure of a column of water, whether the natural result of situation or the artificial result of pumping to an elevated tank, has all the effect of the force-pump and condenser, and will be equally efficient.]

NITRATE OF SODA: *R. V.* We would mix nitrate of soda with salt in your inland county with greater confidence than elsewhere. It may be applied with good effect for Beans; and for a rapid growth, such as that of Rhubarb, we imagine that it and guano applied at frequent intervals in the liquid way would be the best plan to adopt.

POTATOES: *Worcester.* You should have got gas lime together in compost months ago, and turned it frequently if you are going to use it now. A "waggon load" per acre is a common dressing. You may apply it broadcast, and leave it for some weeks before turning it in. You should plant early in spring, early sorts in early soils, and so you will run least risk of the disease. We should ourselves prefer a deepish planting early in March to autumn planting.

ROOT GRAPPLING MACHINE: *A Small Farmer.* We cannot say from personal experience which is the best of the few that we have seen—and must therefore be dependent upon our correspondents giving us information. We should not purchase any of them as at present advised, but retain the use of the Banbury Turnip cutter.

ROUND BRICKS: *Mr. Norton* asks the probable cost of manufacturing round balls of well burned brick, some 3 or 4 inches in diameter. [We would dissuade you from the expence of a patent. The existing plan of pipe drainage affords a much more perfect channel for the exit of drainage water than the interstitial spaces left in the manner you claim to have invented.]

SMALL FARM: *H. G.* We have received your particulars and will endeavour to make use of them in an article on the subject in a week or two.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.*

The barrel is 27½ in. long, and the legs are 5 ft. high.

1¼ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel,	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2¾ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.

NEWLY IMPROVED ECONOMIC STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.

Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35*s.* each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.

JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, a few doors east of the Pantheon.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.

IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.

WARMING AND VENTILATING.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard: 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

PUBLIC INVITATION.

JOHN WEEKS AND CO., King's Road, Chelsea, most respectfully invite those interested in Horticulture, and in the principles of heating by Hot water, to visit their Horticultural Establishment during THIS SEVERE WEATHER. They will now have a fair opportunity of testing the efficiency of the heating apparatus, which is worked by one boiler, 5 feet by 3 feet 6 inches, circulating the water through 5000 feet of pipe extending through houses and pits upwards of 1000 feet in length, and diffusing over the whole a greater supply of heat than is necessary.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HOT-WATER PIPES at wholesale prices, with Elbows, Syphons, Tee Pipes, and every requisite connection. Cast Iron Boilers, 55*s.* each. Improved Soot Doors and Furnace Doors. Builders' Castings of every description kept in Stock at—Mr. LYNCH WHITE'S, Old Barge Iron Wharf, Upper Ground Street (near Blackfriars Bridge), London.

SHEET GLASS (15 oz.) of good quality in 100 feet boxes.

10 in. by 8 in. and under	... ...	15*s.* per box.
11 in. by 9 in. to 22 in. by 14 in.	... ...	17*s.* „
Larger sizes to 28 in. by 18 in.	... ...	19*s.* „

Also similar sizes in 21 oz. Sheet at 24*s.* per box. Boxes charged 2*s.* each, and returnable at the same price, if delivered free. CRYSTAL WHITE GLASS, Crown and Sheet Glass in Crates, British and Patent Plate, &c. &c. White Lead, Oils, Turpentine, Colours, &c.—G. FARMILOE & SON, 118, St. John Street, West Smithfield.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 8*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in.	... 13*s.* 3*d.*	per 100 feet.
7 by 5 to 8 by 6	... 13 6	
8½ by 6½ to 10 by 8 ...	... 14 0	
10½ by 8½ to 14½ by 10½ ...	... 16 0	
17 by 10 to 18 by 12 ...	... 18 0	

A great variety of sizes. Particulars had on application.

ORCHARD HOUSE SQUARES on Mr. RIVERS's plan, to whom I have sold some thousands of feet.

Large Sheets for cutting up, in cases, at 2½*d.* and 3*d.* per foot.

HARTLEY'S IMPROVED ROUGH PLATE GLASS, Sheet, and Rough Plate, Tiles, Milk Pans, Bee and Propagating Glasses, Wasp Traps, Cucumber Tubes, Preserve Jars, with and without covers; Fern Glasses.

Plate, Sheet, Crown, and Ornamental Window Glass. Crystal Glass Shades for ornaments.

Greenhouses, erected in either wood or iron. Garden Lights and Frames.

87, Bishopsgate Street Without, London—same side as Eastern Counties Railway.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

6 by 4 and 6½ by 4½	... ...	10*s.* 6*d.* per box.
7 „ 5 „ 7½ „ 5½	... ...	12 0 „
8 „ 6 „ 8½ „ 6½	... ...	13 6 „
9 „ 7 „ 9½ „ 7½ and 10 by 8	...	15 0 „

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2*s.* each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, without *a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

PHILLIPS' PATENT.

THE PRIZE PULPING MACHINE of the Royal Agricultural Society's Show, held at Lincoln, July, 1854. The First and only Prize ever offered by the Royal Agricultural Society for the best Machine for reducing Roots to a Pulp was awarded to the Machine Invented and Exhibited by FREDERICK PHILLIPS, of The Hall Farm, near Brandon, Suffolk.

FREDERICK PHILLIPS begs to inform the trade that he is prepared to grant Licenses for the making of these Machines.

WOOLLEN NET FOR THE PROTECTION OF WALL FRUIT TREES FROM FROST, 2 and 3 yards wide, can be had of WEATHERHEAD, WALTERS, & Co., Derby. *See Gardeners' Chronicle* of Oct. 28, 1854.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1½-inch " light " ...	8 "	6 "
1½-inch " strong " ...	10 "	8 "
1½-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1*l.*—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square, London.

NEW WINTER SOAP.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d.* each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

TO PARENTS AND GUARDIANS.—The return of youth to the respective boarding-schools induces a solicitude for their personal comfort and attraction. Now it is that ROWLANDS' MACASSAR OIL, for accelerating the growth and for improving and beautifying the hair, ROWLANDS' KALYDOR, for improving the skin and complexion, and removing cutaneous eruptions, and ROWLANDS' ODONTO, or PEARL DENTRIFICE, for rendering the teeth beautifully white and preserving the gums, are considered indispensable accompaniments for the attainment of those personal advantages so universally sought for and admired. Beware of Spurious Imitations. The only Genuine of each bears the name of ROWLANDS' preceding that of the article on the wrapper or label.—Sold by A. ROWLAND and SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

AMANDINE.

A WHITE HAND is indispensable to all; it is the distinguishing mark between refinement and vulgarity. With the aid of Amandine, prepared by H. BREIDENBACH, every hand may be rendered soft, white, and delicate; every rude impression of hard usage and rough weather removed; and the seal of elegance impressed upon it, let its present condition be ever so unpromising. Sold in jars, 2*s.* 6*d.* each.—H. BREIDENBACH, Perfumer, 157B, New Bond Street, London; and by Perfumers and Druggists.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All Sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last eleven years, and is applicable to every kind of single and double Rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7*s.* 6*d.* in postage stamps, cash, or Post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 97A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 3 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

FURNISH YOUR HOUSE WITH THE BEST ARTICLES AT DEANE'S IRONMONGERY AND FURNISHING WAREHOUSES. Established A.D. 1700. A Priced Furnishing List, free by post.—DEANE, DRAY & Co. (Opening to the Monument,) London Bridge.

HOT-AIR, GAS, VESTA, JOYCE'S STOVES.—STOVES for the economical and safe heating of halls, shops, warehouses, passages, basements, and the like, being at this season demanded, WILLIAM S. BURTON invites attention to his unrivalled assortment, adapted (one or the other) to every conceivable requirement, at prices from 10*s.* each to 30 guineas. His variety of register and other stoves is the largest in existence.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS devoted to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

KNOW THYSELF!—The Secret Art of DISCOVERING the TRUE CHARACTER of INDIVIDUALS from the peculiarities of their HANDWRITING, has long been practised by Miss GRAHAM with astonishing success. Her startling delineations are both full and detailed, differing from anything hitherto attempted. All persons wishing to "know themselves," or any friend in whom they are interested, must send a specimen of their writing, stating sex and age, enclosing 13 penny post stamps to Miss GRAHAM, 10, Chichester Place, King's Cross, London, and they will receive in a few days a minute detail of the mental and moral qualities, talents, tastes, affections, virtues, failings, &c., of the writer, with many other things hitherto unsuspected.—"Miss GRAHAM is a most successful graphiologist." *Family Herald.*

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, &c.?—COUPELLE'S CRINUTRIAR, though extensively imitated, is universally acknowledged as the only preparation to be really depended upon for the unfailing production of Hair and Whiskers in two or three weeks; as also checking Greyness, Baldness, &c., and rendering the Hair beautifully luxuriant, curly and glossy. Mr. WILLIAMS, 8, Lowther Street, Liverpool.—"I can now show as fine a head of hair as any person, solely from using your Crinutriar." Sergeant CRAVEN, Longford Barracks, Ireland.—"Through using your Crinutriar, I have an excellent Moustache, which I had before despaired of." Mrs. CARTER, Pangbourne, Berks.—"My head, which was quite bald, is now covered with new hair." Price 2*s.* per package, through all Druggists and Perfumers, or sent post free on receipt of 24 penny stamps by ROSALIE COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London.

HOLLOWAY'S OINTMENT AND PILLS INCOMPARBLE REMEDIES FOR BAD LEGS.—Mr. Shackell, Butcher, of Old Brentford, was afflicted for a long time with three wounds in his legs, which rendered him totally unable to attend to his usual avocations; in fact his leg was so bad that it defied all medical skill to effect a cure. He then made use of HOLLOWAY'S Ointment and Pills, paying every attention to the instructions given with the medicines, and the result was, after persevering with these remedies for about 10 weeks, that his leg is completely cured, and he now enjoys the best of health.—Sold by all Medicine Vendors, and at Professor HOLLOWAY'S Establishment, 244 Strand, London, and 80, Maiden Lane, New York.

ASTHMA, COUGHS, COLDS, AND INFLUENZA SPEEDILY CURED, AND INSTANTLY RELIEVED BY THE USE OF SPENCER'S PULMONIC ELIXIR.

This fine medicine will be found admirably adapted to promote expectoration, ease the breathing, loosen the phlegm, abate fever, and allay the tickling sensation which occasions the cough, without tightening the chest; and for all temporary and local affections, such as wheezing, irritation of the throat, palpitation of the heart, hoarseness of the voice, influenza, &c., it affords immediate relief; while in more chronic disorders, as periodical coughs or inveterate asthma, it is equally valuable in its effects, although of course a little longer perseverance in the use of the article is required.—Prepared only by T. ROBERTS & Co., Crane Court, Fleet Street, London; and by all respectable medicine-vendors and chemists in the kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each; the bottles at 2*s.* 9*d.* contain nearly as much as three small ones.

*** Ask for SPENCER'S Pulmonic Elixir.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

AT MR. MECHI'S ESTABLISHMENT, 4, Leadenhall Street, London, are exhibited the finest specimens of British Manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury suitable for presentation. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c., as usual. Shipping orders executed for merchants and captains. An extensive assortment of superior Hair and other Brushes for the Toilet.

TO MARKET GARDENERS AND OTHERS.

DAWLEY DEEP, MIDDLESEX, NEAR BULL'S BRIDGE STATION, ON THE GREAT WESTERN RAILWAY.

TO BE LET ON LEASE, for a term of years to be agreed upon, about 21 acres more or less of highly cultivated GARDEN GROUND, well stocked with a choice assortment of Fruit Trees of all kinds, and in full bearing condition; bounded by a high brick wall on one side facing the south, and covered with Fruit Trees of the finest quality. Immediate possession if required.—For further particulars, inquire at 23, Holywell Street, Westminster; or of Mr. SMITH, on the premises.

NURSERY AND SEED BUSINESS,

ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station. Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

TO BE LET ON LEASE, for a term from Michaelmas next, with the usual entry forthwith, a highly reputed CORN and STOCK FARM, in North Hants, containing 1057 acres, very compact, and with Market and Railway facilities.—To view and treat, apply to LAMB, BROOKS, & Co., Solicitors, Basingstoke, or Odiham, Hants. References as to substance and character will be required.

TO BE SOLD, at about half-price, a PATENT CONSERVATORY—a great bargain—on account of making alterations. Now standing in front of E. DENCH'S Patent Hothouse Works, King's Road, Chelsea.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. FOX'S, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

Sales by Auction.

COCHIN CHINA FOWLS.

MR. J. C. STEVENS begs to notify that he has received instructions from Thomas Sturgeon, Esq., of Grays, to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 23d January, at 12 o'clock precisely, a selection of COCHIN CHINA FOWLS consisting entirely of first-class birds. *** This is the only old and known strain of Buffs now in the hands of the original breeder. Mr. Sturgeon has bred them with rare care and judgment for many years, no second-rate bird has been bred from, and they are unrivalled in their combination of form, size, and colour. Up to 1852 they were the winners of all the best prizes at Birmingham, Cheltenham, Winchester, &c., and were never beaten, since which they have not been shown till within the last few weeks, when they took the Silver Vase and 1st Prize at Manchester.—May be viewed the morning of sale. Catalogues, by enclosing a stamped directed envelope, to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

COCHIN CHINA FOWLS.

MR. PUNCHARD'S ANNUAL SALE.

MR. J. C. STEVENS begs to notify that he has received instructions from Mr. Punchard to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 30th January, at 12 o'clock precisely, a selection of first class COCHIN CHINA FOWLS, bred in the celebrated Yards of Blunts Hall, Haverhill, the Stock of which has been strengthened by careful importations, and the Birds from which were the winners of the Silver Vase, and also one other First Prize for Cochins, at the late Birmingham Exhibition.—May be viewed on the morning of Sale, and Catalogues had by inclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

POSTPONEMENT OF SALE.

MESSRS. PROTHEROE AND MORRIS are instructed by Mons. A. Van Geert, of Ghent, to announce that the SALE of CAMELLIAS and other Plants, announced for the 25th inst., is, in consequence of the inclemency of the weather, postponed till further notice.—American Nursery, Leytonstone, Essex.

BROMPTON PARK NURSERY.

TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to an unreserved Sale by Auction, on the premises, the Brompton Park Nursery, Brompton, near the "Hoop and Toy," on MONDAY, January 22d, at 11 o'clock, by order of the Royal Commissioners for the Exhibition of 1851, in consequence of the land being required for the formation of new roads, a portion of the valuable Stock growing on the above celebrated Nursery, consisting of FRUIT TREES and EVERGREENS, comprising Standard and Dwarf trained and untrained Apple, Pear, Plum, Peach, Nectarine, Apricot, Cherry, a quantity of Vines, Clematis, and Ivies in pots, Rhubarb, &c.—May be viewed three days prior to the Sale. Catalogues may be had of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NURSERYMEN, GENTLEMEN, AND OTHERS.

MR. J. WILLMER will Sell by Auction, on the Premises, Sunbury Nursery, on TUESDAY, January 23, 1855, and following day, at 12 o'clock precisely each day, the stock of this well known Nursery, consisting of Green and Striped Hollies, from 2 to 10 feet; Arbutus, 3 to 7 feet; Laurels, 3 feet; Portugals, 3 to 5 feet; Yews, 4 to 10 feet; Red Cedars, 2 to 6 feet; Arborvitæ, 2 to 4 feet; Cedrus Deodara, 4 to 6 feet; Bays, 3 to 4 feet; Scarlet Rhododendrons, Rhododendron pontica, Laurustinus, 3 to 6 feet; Evergreen Privet, 2 feet; Aucuba, 2 to 4 feet; Phillyrea, 6 feet; Box Edging, Irish Ivy in pots, Standard and Dwarf Pears, large dwarf Plums, Standard Quinces, Hornbeam hedges, Spruce and Balm Firs from 4 to 12 feet, Beech, Elm, Lime, Ash, Acacia, Oak, Horse Chesnut, Spanish Chesnut, from 6 to 14 feet. May be viewed till time of Sale, and Catalogues had on the Premises, or by forwarding two Postage Stamps to the Auctioneer, Sunbury, Middlesex.

LAURELS FOR THE MILLION.

DAVID FERGUSON, Landscape Gardener and Contracting Planter,

INFORMS the public that he grows a LARGE STOCK of TREES and SHRUBS for the purpose of enabling him to CHARGE LOW, and give at once PRESENT EFFECT, when carrying out his plans, which is of consequence to those who prefer having the BENEFIT of Shady Walks, Glades, and Recesses of their own planting, in place of the mixed MILK and WATER SYSTEM of planting frequently met with for the benefit of GRANDCHILDREN.

As D. F. has MORE LAURELS than would crown the Heads of all the HEROINES and HEROES in EUROPE, he will be happy to part with them on LOW TERMS for CASH; also NEW DOUBLE PINK and SINGLE CRIMSON THORNS, YEWS, PORTUGAL LAURELS, BERBERIS AQUIFOLIUM, BOX, AUCUBAS, CEDRUS DEODARA, Standard and Dwarf Budded GEANT DES BATAILLES, and other ROSES, &c. If the LAURELS are taken by the Ten, Twenty, Fifty, or ONE HUNDRED THOUSAND, they will be sold at a price that will soon SAVE THEIR COST in LABOUR. My Plan is to lay them in very close together as under cover, giving at once a good ground outline, and something for the eye to repose on, in place of the HOEING, SCRAPING, and ALWAYS WANTING UNSATISFACTORY SYSTEM generally practised.

D. F. was many years Gardener to the late P. C. Labouchere, Esq., Hylands, Essex, and is well acquainted with Forcing Grapes, Peaches, Apricots, Strawberries, Melons, French Beans, Lettuce, Carrots, &c., on the Dutch system, which is superior to the British where a good stud of horses is kept.

Plans of Houses and Pits, &c., furnished on the Dutch and English Systems.

D. F. will feel much pleasure in recommending a worthy gardener to any Lady or Gentleman in want of one.—Stowe, Buckingham.

RENDLE'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready. They can be had to suit various sized Gardens at the following prices:—*

No. 1 COLLECTION	... ...	£3 0 0
" 2 "	... ...	2 0 0
" 3 "	... ...	1 5 0
" 4 "	... ...	0 15 0

The quantities are fully detailed in their "Price Current and Garden Directory," a new edition of which is just published.

WILLIAM E. RENDLE & CO., Seed Growers, Plymouth.
ESTABLISHED 68 YEARS.

SUTTON'S COMPLETE COLLECTIONS, CARRIAGE FREE.

PARTICULARS OF THE SORTS AND QUANTITIES CONTAINED IN SUTTON'S COLLECTIONS OF SEEDS will be sent post free on receipt of a stamped envelope with address.

By the perusal of this List, it will be seen that the very best kinds of Vegetable Seeds may be obtained in full quantities, and proper proportions for one year's supply of a large garden for the sum of 3l., and other complete Collections of equally choice sorts for smaller Gardens at 2l., 1l. 5s., and 1l. The economy of cost is by no means the only advantage gained by ordering one of these Collections.

Address, JOHN SUTTON & SONS, Seed Growers, Reading.

VEGETABLE AND FLOWER SEEDS.

PETER LAWSON AND SON beg leave to intimate to their English customers and the public that they are prepared to supply from their London establishment assortments of GARDEN and FLOWER SEEDS of superior quality, comprising all the esteemed standard sorts and those recently introduced. They will be happy to send Catalogues on application.

P. L. & Son have also to intimate that they will shortly issue their LIST of AGRICULTURAL SEEDS, all of which have been carefully saved from the most select stocks.

Liberal arrangements will be made for the carriage of their seeds to all quarters.

PETER LAWSON AND SON,
Queen's Seedsmen, Wood Foresters, &c., for Scotland, and to the Highland and Agricultural Society, 27, Great George Street, Westminster, London.

W. DRUMMOND AND SONS' NEW DESCRIPTIVE CATALOGUE, containing select varieties only, of VEGETABLE and FLOWER SEEDS is now ready, and may be had post free on receipt of one postage stamp. This Catalogue will, at a glance, furnish the Gardener with all the necessary material for drawing out his Seed List correctly and without trouble. In reference to it the *Gardeners' Chronicle* remarks:—

"It is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon for the sake of both buyer and seller;" and this opinion has been cordially responded to by all our old and many new customers.

W. DRUMMOND & SONS' Seed and Implement Warehouse, Stirling.

GERMAN FLOWER SEEDS.

MOSCHKOWITZ AND SIEGLING, Erfurt, beg to inform the trade that their new Wholesale Catalogue of Choice German and other Flower Seeds, is now ready, and may be had on application to their Agent, Mr. H. HENKEL, 70, Fenchurch Street, London.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

HOLLYHOCKS.

JOHN CHATER AND SON offer the following New and Choice HOLLYHOCKS in Pots at 18s. per dozen, hamper included:—Pourpre de Tyre, Yellow Model, Saffranot, Duke of Rutland (new), Penelope, Swansdown, Gem, Lady Braybrooke, Spectabilis, White Perfection, Black Prince (new), King of Roses, Raphael, Napoleon, Magnum Bonum, &c.

Also the following strong ground Roots, 7s. 6d. per dozen:—Queen, Bella Donna, Elegans, Brilliant, Marmion, Mrs. Russell, Venosa rubra, Obscura, Aurantia, Purpurea elegans, Flower of the Day, Marchioness of Breadalbane, Queen of England, and Model of Perfection.

New Crimson Rockets, 6s. per dozen; Double White do., 3s. per dozen, 20s. per 100.

Hollyhock Seed, in packets containing 200 seeds, 1s. 6d.; 400, 2s. 6d.; warranted from best flowers. Choice Pansy, 1s. per packet. Sweet William, 6d.

Descriptive Catalogues may be had on application to J. CHATER & SON, Haverhill, Suffolk.—Post Office Orders payable at Haverhill.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli is prepared to send it out in packets at 2s. 6d. each.

Each may be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

NEW CATALOGUE OF FLORISTS' FLOWERS, 1855.

CAREY TYSO, FLORIST, &c., Wallingford, Berks, will send his DESCRIPTIVE CATALOGUE of Anemones, Ranunculuses, Carnations, Picotees, Dahlias, &c., for one stamp. Also his Flower Seed List for one stamp.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

FOREST AND ORNAMENTAL TREES AND SHRUBS.

DAVID REID AND SON, NURSERYMEN AND FLORISTS, Leith Walk, Edinburgh, beg to intimate their CATALOGUES as above are ready, and to be had free on application.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM BARRATT, Wakefield.

☞ A quantity of fine Transplanted White Thorns.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

SUTTON'S PRICED SEED AND PLANT LIST, WITH INSTRUCTIONS ON CULTIVATION, CALENDAR OF OPERATIONS, and other Useful Information is now published, price Sixpence; and being entered at Stationers' Hall is copyright.

As this publication is compiled principally for the use of Messrs. SUTTON'S CUSTOMERS, it is requested that those who have not yet received it will forward their Address, when a copy will be sent gratis, and post free. Other persons will receive it post free in return for six postage or receipt stamps.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

RANUNCULUSES, ANEMONES, LILIUM LANCIFOLIUM, CALOCHORTUS LUTEUS, CALLIPRORA FLAVA, GLADIOLUS, TRITONEA AUREA, DIELYTRA SPECTABILIS, VALLOTA PURPUREA, ANOMATHECA CRUENTA, AND AURICULAS.

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY, begs to say that he has a fine Selection of the above BULBS, &c., which he can supply at Moderate Prices. His Catalogue will be forwarded on application.

LOANS, from 25*l.* to 1000*l.*, upon approved personal or other security, repayable by easy instalments, extending over any period not exceeding 50 months, are readily OBTAINABLE from the BRITISH MUTUAL SUBSCRIPTION LOAN ASSURANCE CLASSES.—Prospectuses, reports, and every information may be obtained on application at the British Mutual Life Office, 17, New Bridge Street, Blackfriars. Rules, 6*d.* each copy, or 1*s.* per post. CHARLES JAMES THICKE, Resident Sec.

ALEXANDER GREGORY	First	62	69
WILLIAM THORNTON	First	69	9

The Chairman declared Elizabeth Curtis, Robert Oliver, and Henry Schneider, as having the greatest number of Votes, duly elected Pensioners on this Charity.

E. R. CUTLER, Secretary.

14, Tavistock Row, Covent Garden, January 18.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—JOHN KENT desires to return his most sincere thanks to those friends who so kindly supported him at the last Election, and hopes to be favoured with their further support at the Election in June next.

GARDENERS' BENEVOLENT INSTITUTION. HENRY SCHNEIDER, of Ford, Wilts, returns his grateful thanks to the subscribers who so kindly supported him on his election as a pensioner of the above institution.—Jan. 27.

ROBERT OLIVER begs to return his very grateful thanks to those members of the GARDENERS' ROYAL BENEVOLENT INSTITUTION, who have so kindly voted for him at the late election.—Sheffield, Jan. 24.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM BARRATT, Wakefield.

☞ A quantity of fine Transplanted White Thorns.

DIOSCOREA JAPONICA.

WILLIAM MASTERS AND SON will have pleasure in supplying tubers with the Chinese mode of culture at the following prices:—

4 Tubers	£0	10	0	50 Tubers	£5	5	0
10 Ditto	1	2	6	100 Ditto	10	0	0

Assorted Collections of Vegetable Seeds, from 10*s*. 6*d*. to 63*s*., adapted for large or small gardens.—Exotic Nursery, Canterbury.

CEMETERIES.

WILLIAM MASTERS AND SON having been engaged upon extensive Cemetery works, are prepared to undertake the LAYING OUT and PLANTING NEW GROUNDS, as well as the Ornamenting such as are closed by the recent Act of Parliament, by contract or otherwise.—WILLIAM MASTERS & SON, Landscape Gardeners, Canterbury.

NEW BEDDING GERANIUM.

GAINES' SCARLET UNIQUE.

N. GAINES begs to inform the nobility, gentry, and trade in general that he can supply strong healthy plants of the above beautiful variety. In habit it is like Rollisson's Unique, producing magnificent trusses of brilliant scarlet flowers. It was exhibited at the Chiswick and Royal Botanic Horticultural Shows, where it was considered a great novelty, and well adapted for bedding purposes. Price 5*s*. per plant; when three are taken, a fourth will be sent to compensate for carriage.

A Descriptive List of his large Collection of Pelargoniums, Show and Fancy varieties, also Stove, Greenhouse, and Hardwooded Plants, may be had Post free, by applying at the Nursery, Surrey Lane, Battersea, Surrey.

TO THE SEED TRADE.

WILLIAM E. RENDLE, SEED MERCHANTS, Plymouth, *have to offer some very Choice Stocks of* SEEDS *to the Trade. Wholesale Catalogues can be had on application to*

WILLIAM E. RENDLE & Co., Union Road, Plymouth.

WHITE BELGIAN CARROT, MANGOLD WURZEL, &c.—*Several Tons to be disposed of at the lowest market prices.—Apply to*

WILLIAM E. RENDLE & CO., SEED MERCHANTS, Plymouth.

NEW SEEDS JUST HARVESTED *can now be obtained of the most genuine description, from*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

TRUE PENZANCE BROCCOLI, *saved by one of the best growers in the neighbourhood of Penzance*, 1*s*. per packet, from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

HOLCUS SACCHARATUS, OR CHINESE SUGAR CANE.—*For a full description, see the leading article in the* GARDENERS' CHRONICLE, *by Professor Lindley, page* 35, *January* 20, 1855.

WILLIAM E. RENDLE & Co., Seed Merchants, have just imported from France an excellent parcel of Seeds, which will be sold in sealed packets at 1*s*. and 2*s*. 6*d*. each, post free.—Apply to

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

HOLCUS SACCHARATUS, OR CHINESE SUGAR CANE.

SUTTON AND SONS *can supply this Seed genuine as imported in sealed packets at* 1*s*. *or* 2*s*. 6*d*. *each. Post Free.*

For description and uses, see *Gardeners' Chronicle*, Dec. 30th, 1854, p. 835.—SUTTON & SONS, Seed Growers, Reading.

IPOMŒA RUBRO CÆRULEA.

GEORGE ROBERTS begs to acquaint the Seed Trade that he can supply the above choice seed at a considerable reduction on the prices of past years.

32, Moorgate Street, London.

SEEDLING FOREST TREES AND SHRUBS.

DAVID REID AND SON, NURSERYMEN and FLORISTS, Leith Walk, Edinburgh, beg to direct the attention of the trade to their Stock of Seedlings as above.

Catalogues free on application.

YEWS FOR HEDGES.

EDWARD SANG AND SONS, Kirkaldy, have for sale, at a low price, a large quantity of fine healthy YEWS, once, twice, and three times transplanted, in various sizes, from 12 to 30 inches high.

TO THE TRADE.

J. ROY, Jun., SEEDSMAN, Aberdeen, has got to hand a consignment of 35 bales of very superior CUBA BAST. The bales weigh about 1½ cwt. each. Price forwarded on application.

JOHN HOLLAND can supply, in strong plants, the heaviest Lancashire Show GOOSEBERRIES (named), of excellent flavour, and large size, at 6*s*. per dozen, on receipt of Post-office order, payable to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

MANGOLD WURZEL SEED.

TO BE SOLD, LONG RED and YELLOW GLOBE, growth of 1854, from superior stock.—Apply to R. S. HEWS, Kelvedon, Essex.

IMPORTANT TO SEEDSMEN AND OTHERS.

TO BE SOLD by a Grower, at a moderate Price, 300 Bushels of GREEN GLOBE TURNIP SEED, all of the growth of 1854, first-rate in sample, and stock warranted. To be sold in small or large quantities, at the option of the purchaser.—Apply to Mr. WM. TAYLOR, Nashenden Farm, Rochester, Kent.

TO BE SOLD immediately, fine sound DUTCH BULBS, just arrived, at about half catalogue price. They consist of every description of Hyacinth, Tulip, Anemones, Ranunculuses, Narcissus, &c.—For particulars of price, apply, by letter, to Mr. JOHN WILLIAMS, 9 and 10, St. Bride's Avenue, Fleet Street, London.

ASH-LEAVED KIDNEY POTATOES.

TO BE SOLD, a quantity of this valuable POTATO, sound and pure, at 5*s*. per 4 stones. They will be put on to the Railway without additional charge, excepting cost price of bags.—Apply to JOHN BELDON, Gardener, East Abbey, Richmond, Yorkshire.

THE EARLY CHAMPION ASHLEAF.

JOSEPH WILSON, SEEDSMAN, Ipswich, begs to call the attention of Growers and the Trade to the New ASHLEAF called the "EARLY CHAMPION," as being decidedly the finest ever yet introduced; it is more prolific, finer flavour hardier, and about 10 days earlier than any other Ashleaf; out of an acre planted last season there was not a single diseased root found. Price 12*s*. per bushel, free to London, and no charge for sacks. Orders must be accompanied with a remittance.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.

To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

Post-office Orders to be made payable at Middleton, Lancashire.

SUTTON'S SHORT SEED LIST.

SUTTON'S SHORT SEED LIST, *containing only the most desirable sorts, will be sent post free, in return for one penny postage draft or receipt stamp.*

SUTTON & SONS, Seed Growers, Reading, Berks.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY for 1855 *is now published, price* 6*d*. *To be had of all Booksellers, and from*

WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth*

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

GERMAN FLOWER SEEDS.

MOSCHKOWITZ AND SIEGLING, Erfurt, beg to inform the trade that their new Wholesale Catalogue of Choice German and other Flower Seeds, is now ready, and may be had on application to their Agent, Mr. H. HENKEL, 70, Fenchurch Street, London.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.

Seed Establishment, 181, High Holborn, London.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s*. per lb.; smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

GOLDEN DROP GREEN FLESH MELON,

SIX SEEDS FOR 1*s*. 6*d*.

WILLIAM WOOD AND SON beg to inform their Friends and the Public that they have sold their stock of Seeds of the above superior Melon to Mr. EDWARD TILEY, Nurseryman, 14, Abbey Churchyard, Bath, who will be happy to supply orders for the same.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.

J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).

CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

PYRAMIDAL PEAR TREES,

GRAFTED ON THE QUINCE STOCKS.

J. AND J. FRASER have still to offer strong trees of the above PEARS; a Descriptive Catalogue of the sorts may be had on application. To prevent disappointment early orders are requested, as the Stock of some of the varieties is getting low.—The Nurseries, Lea Bridge Road, Essex.

RANUNCULUSES, ANEMONES, LILIUM LANCIFOLIUM, CALOCHORTUS LUTEUS, CALLIPRORA FLAVA, GLADIOLUS, TRITONEA AUREA, DIELYTRA SPECTABILIS, VALLOTA PURPUREA, ANOMATHECA CRUENTA, AND AURICULAS.

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY, begs to say that he has a fine Selection of the above BULBS, &c., which he can supply at Moderate Prices. His Catalogue will be forwarded on application.

GENERAL SEED ESTABLISHMENT, NORTHAMPTON.

JOHN JEYES begs leave to inform his Patrons and Friends that his general stock of Seeds is now complete, and that he shall feel obliged by their early orders. He has a good supply of all those various Seeds his Establishment has long been celebrated for, such as—

Matchless Cabbage	Snow's Green Cos Lettuce
Imperial Cos Lettuce	" Broccoli
Conqueror Pea	Northampton Market Broccoli
Blood Red Beet	Giant Asparagus,
Dwarf Prolific Bean	&c. &c.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s*. per doz.; HOWARD'S PRINCE ALBERT, 12*s*. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.

Manor Farm, Deptford, Jan. 27.

CHEAP AND GOOD CINERARIAS.—Fine flowering plants from Turner's best seed in large 60 and 48 pots, just coming into bloom, at from 4*s*. to 6*s*. per dozen. Also fine plants of named varieties, consisting of Mr. and Mrs. S. Herbert, Adela Villiers, Garland, Constellation, Lady H. Campbell, Kate Kearney, Flora M'Ivor, Étoile de Venus, &c., at 9*s*. per dozen.—WOOD & INGRAM, Nurseries, Huntingdon.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their Stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out.

Their Seeds may be fully relied on as being in every respect of first-rate quality, and true to their sorts. Catalogues may be had on application.—Pine Apple Place, Edgeware Road, London.

SUTTON'S COLLECTIONS OF GARDEN SEEDS.

No. 1. A COMPLETE COLLECTION of KITCHEN GARDEN SEEDS for a LARGE GARDEN, for one whole year's supply	£3 0 0

WHEELER AND SON'S
SHORT SELECT SEED LIST.

OUR PRICED LIST OF SEEDS for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers. *We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year;* and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.

J. C. WHEELER & SON, GLOUCESTER.
SEEDSMEN TO THE GLOUCESTERSHIRE AGRICULTURAL SOCIETY.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KERSAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. *** A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

NEW RIDGE CUCUMBER, VECTIS.

THOMAS TAYLOR begs to inform the public he has produced this fine Cucumber and grown it this last three years, and can with confidence recommend it as the best ridge Cucumber ever offered to the public, being equal in quality and flavour to many of the frame varieties, and very prolific. T. T. is now ready to send it out at 1s. per packet, 12 seeds post free.—THOS. TAYLOR, Nurseryman, Weston-super-Mare, Somerset.

DR. SYNTAX CUCUMBER.—The above celebrated variety has been nearly lost to gardeners for several years past. It is known by all experienced growers of Cucumbers to be the very best sort in existence for early work.

A paper sent free per post on receipt of 13 stamps.

SNOW'S HORTICULTURAL BROCCOLI.—Half-ounce Packet sent free per post on receipt of 24 stamps.

NORTHAMPTON MARKET BROCCOLI.—This variety is grown by the market gardeners here, and excites the admiration of all who see it. Visitors say "they never saw such Broccoli anywhere else." Half-ounce Packets sent free per post for 14 stamps.—JOHN JEYES, Nurseries, Northampton.

SPRUCE FIRS from 6 to 9 feet high, well-rooted, and quite safe to remove, being well adapted for screens, filling up old plantations, or for immediate effect.

FINE BEECH fit for hedges or plantations, 6 feet and upwards.

G. WHEELER, Nurseryman, Warminster, Wilts, having a surplus stock of the above, is disposed to sell them on extremely moderate terms, which may be obtained on application.

G. W. has a good stock of SCOTCH FIRS, 2 to 3 feet, a large stock of RHODODENDRON suitable for cover in woods, plantations, drives, &c., from 1 foot and upwards, with fine strong American Azaleas, at very moderate prices.

SEEDLING CALCEOLARIA, raised from the finest spotted kinds, will be sent carriage free on receipt of a Post Office Order for the amount, at 30s. per 100.

	Per doz.
BULBS OF TIGRIDIA PAVONIA, Red Tiger Flower...	2 0
" " CONCHIFLORA, Yellow ditto	4 0
" " WHEELERI, Scarlet ditto ...	4 0

Carriage free for cash.

CUCUMBERS, first-rate.—THE KING, a very handsome Black Spine, and Ingram's Hybrid White Spine, a most prolific kind, both approved and esteemed sorts, at 1s. per packet.—G. WHEELER, Warminster, Jan. 27.

NOTICE.—The EXECUTORS of the late MR. MOSES REID, NURSERYMAN and SEEDSMAN, of Middlewich, having disposed of the Stock and Business to Mr. G. H. NUTTING, all further orders and communications connected with the concern are requested to be made to him. He is also authorised to receive all outstanding accounts due to the late Mr. Reid.

Middlewich, 25th Jan., 1855. MOSES REID, B. D. VAWDREY, } Executors.

GEORGE H. NUTTING wishes most respectfully to solicit a continuation of the patronage so liberally bestowed upon the late Mr. Reid, and trusts by constant attention to the wishes of his patrons to merit their confidence and support. He would further assure the public generally that all Plants and Seeds sent out by him will be of the best quality, correctly named, and at the lowest remunerating price.

*** A few large Oak and other Trees suitable for Hedge-row or Park planting on Sale; apply as above.

DICKSON'S EARLY FAVOURITE PEA (NEW).

FRANCIS AND ARTHUR DICKSON AND SONS, Seed Merchants, &c., Chester, have much satisfaction in introducing the above new Pea, which they believe they are perfectly justified in saying is the best and most prolific Early Pea in cultivation.

It has been tried side by side with all the best early and second early Peas of the day, and has been pronounced by many eminent gardeners who saw it under the circumstances to be much superior to any variety of its season hitherto introduced.

It comes in about a week later than the "Early Emperor" (sown at the same time), grows about 4 feet high, and produces a wonderful profusion of pods, which contain on an average 10 Peas of excellent quality and flavour.

For opinions of Dr. Lindley and Mr. Thompson, see *Gardeners' Chronicle* of 20th January, 1855.

Price 3s. 6d. per Quart; per Pint, 2s. Messrs. Hurst & M'Mullen, Seedsmen, &c., 6, Leadenhall Street, wholesale London Agents; and to be had from most Nurserymen and Seedsmen throughout the United Kingdom.—N. B. The Trade supplied on liberal terms.—106, Eastgate Street, Chester; (and 14, Corporation Street, Manchester).—Jan. 27.

NEW PEA.

W. J. EPPS, Seed Merchant and Grower, Maidstone, has much pleasure in offering the following Pea, feeling assured it will give the highest satisfaction.

LORD RAGLAN, OR IMPROVED MAMMOTH.

This Pea was selected from Hair's dwarf Mammoth two years since, and is unquestionably the best and finest in cultivation, and will prove to be the standard Pea of the day. It is a dwarf green wrinkled marrow of very large size, and an immense cropper. Habit dwarf, branching 3 to 4 feet high, producing immense clusters of large bright green pods from the base of the haulm to the top, and similar in shape to the Scimitar, but of greater size, well filled with seven to ten Peas, which are larger than the British Queen, and equal, if not superior in its flavour.

Price, 5s. per Quart. Wholesale Prices to be had on application. Agent: Messrs. Hurst and M'Mullen, Seed Merchants, Leadenhall Street, London.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4s. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9s. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12s. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2s. 6d. each.

Each may be had of Messrs. Noble, Cooper, & Bolton, 152, Fleet Street; and Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

NEW SEEDLING POTATO—THE CHAMPION KIDNEY.

This Potato bears a great resemblance to that fine old Potato, the Ashleaf Kidney; it possesses the following good qualities over the Ashleaf. If planted at the same time it will be ten days earlier, all the sets always vegetate well, and do not die off in the ground as the Ashleaf does; 2 pecks of seed will produce a greater weight of Potatoes than 3 pecks of the Ashleaf. It is quite equal to that in flavour, and is eatable during the whole winter. Sets that have had the shoots broken off five or six times during the spring will vegetate again as if it had been the first shoot. About twenty Gentlemen and Gardeners who had seed to plant last season have assured me that they never before grew any Potato to equal it, and should continue to grow it as a first early Potato. Numerous orders have been already received from persons who saw it growing during the last summer. It has been grown and thoroughly proved for the last four years, and found to be less liable to disease than any other Potato that has been grown. Out of 25 sacks grown this season there was not a single diseased Potato among them.

Sold in quantities of not less than 1 peck; they will be sent Hamper and Package free, at 5s. 6d. per peck, or 4 pecks for 1l., hamper free. A remittance in cash must accompany all orders, or small amounts in penny postage stamps. Purchasers would do well to name the nearest railway station to their residence.

EDWARD TILEY, Nurseryman, Seedsman, & Florist, 14, Abbey Church Yard, Bath, Somerset.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

W. DRUMMOND AND SONS' NEW DESCRIPTIVE CATALOGUE, containing select varieties only, of VEGETABLE and FLOWER SEEDS is now ready, and may be had post free on receipt of one postage stamp. This Catalogue will, at a glance, furnish the Gardener with all the necessary material for drawing out his Seed List correctly and without trouble. In reference to it the *Gardeners' Chronicle* remarks:—

"It is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon for the sake of both buyer and seller;" and this opinion has been cordially responded to by all our old and many new customers.

W. Drummond & Sons' Seed and Implement Warehouse, Stirling.

GODFREY'S BLACK SPINE.

Splendid and Prolific Frame Cucumber.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom; average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2s. 6d.; 6 ditto, 1s. 6d.

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. Hurst & M'Mullen, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1s. each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, January 27.

SPECIMEN IRISH YEWS.

THOMAS JACKSON AND SON, having a large Stock of fine specimens of this very ornamental tree, beg to offer them at the undernamed low prices.

8 to 9 feet high,	and 8 feet in circumference	...	63s.	0d.	each.
8 "	and 4 to 5 feet	" ...	21	0	"
7 to 8 "	and 4 feet	" ...	15	0	"
6 to 7 "	and 3 to 4 feet	" ...	10	6	"
6 "	and 3 feet	" ...	7	6	"

Handsome smaller specimens at proportionately lower prices. Kingston, Surrey.

VEGETABLE AND FLOWER SEEDS.

PETER LAWSON AND SON beg leave to intimate to their English customers and the public that they are prepared to supply from their London establishment assortments of GARDEN and FLOWER SEEDS of superior quality, comprising all the esteemed standard sorts and those recently introduced. They will be happy to send Catalogues on application.

P. L. & Son have also to intimate that they will shortly issue their LIST of AGRICULTURAL SEEDS, all of which have been carefully saved from the most select stocks.

Liberal arrangements will be made for the carriage of their seeds to all quarters.

PETER LAWSON AND SON,

Queen's Seedsmen, Wood Foresters, &c., for Scotland, and to the Highland and Agricultural Society, 27, Great George Street, Westminster, London.

VEGETABLE AND FLOWER SEEDS.

JAMES DICKSON AND SONS beg to intimate to their Patrons and the Public that, having now completed their stock of GARDEN and FLOWER SEEDS for this season, from the best growers and truest stocks, they are now prepared to send them out, making arrangements for carriage likely to meet the views of all parties who may favour them with their commands. Priced Catalogues may be had on application.

J. D. & Sons would also call attention to their AGRICULTURAL SEEDS, which have been carefully grown under their own inspection, from selected stock, priced lists of which will be ready shortly.—Nursery and Seed Warehouse, 32, South Hanover Street, Edinburgh.

GRASS SEEDS.

SUTTON'S GRASS SEEDS (Carriage Free). NATURAL GRASS SEEDS FOR PERMANENT PASTURES, separate or mixed, expressly to suit the soil.—Messrs. Sutton and Sons having for many years paid especial attention to the examination of Natural Pastures, and the collecting of the Grasses which thrive in the various soils of Great Britain and Ireland, are enabled to supply the sorts and quantities of Seeds, varied to suit the soil for which they are intended. The cost will vary from **24s.** to **30s.** per acre, according to the sorts and quantities the soil requires.

FINE LAWN GRASS SEEDS, for making New or improving Old Lawns, price **1s.** per pound, 2s. 6d. per gallon, or 20s. per bushel. For forming new Lawns, 2½ bushels, or 50 lbs., is the quantity required per acre.

FINE GRASS AND CLOVER SEEDS FOR IMPROVING OLD PASTURES (Sutton's Renovating Mixture). Quantity required per acre, 8 lbs. to 12 lbs. **price 9d.** per lb.

N.B. *It will be seen above that we have greatly reduced the prices of our Grass Seeds this season, especially the fine Lawn Seeds and "Sutton's Renovating Mixture" for improving Meadows and Pastures; and we doubt not that our liberal charges will induce a more general practice of sowing our superior kinds of Grass Seeds.*

Sutton & Sons, Seed Growers, Reading, Berks.

RENDLE'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready. They can be had to suit various sized Gardens at the following prices:—*

No. 1 COLLECTION	... ...	£3	0	0
" 2 "	... ...	2	0	0
" 3 "	... ...	1	5	0
" 4 "	... ...	0	15	0

The quantities are fully detailed in their "Price Current and Garden Directory," a new edition of which is just published.

William E. Rendle & Co., Seed Growers, Plymouth.
Established 68 Years.

MELVILLE'S HARDY SCOTCH BROCCOLI *will stand the most severe winter, and therefore invaluable.* 100 Seeds for 1s.

For full description, see "Rendle's Price Current and Garden Directory for 1855."

William E. Rendle & Co., Seed Merchants, Plymouth.

MELVILLE'S TREBLE CURLED GARNISHING BORECOLE.—*This is the choicest and most useful Vegetable for garnishing ever introduced, and should be grown in every garden.* 200 Seeds for 1s.

William E. Rendle & Co., Seed Merchants, Plymouth.

MELVILLE'S NEW INTERMEDIATE HYBRID CABBAGE.—*This is a valuable addition to our stock of Vegetables, and should be had by all who have gardens.* 200 Seeds for 1s.

For description see "Rendle's Price Current and Garden Directory for 1855."

William E. Rendle & Co., Seed Merchants, Plymouth.

NURSERY AND SEED ESTABLISHMENT, SLEAFORD.

CHARLES SHARPE AND CO., Seed Growers, beg most respectfully to invite the attention of the trade to their very superior Stocks of GARDEN AND AGRICULTURAL SEEDS, all of which have been carefully grown by themselves.—Catalogues of prices may be had on application.

TWO NEW CUCUMBERS—"SIR COLIN CAMPBELL" AND "GENERAL CANROBERT."—For the full Description of the above two unequalled Cucumbers, and the List of EDWARD TILEY'S Collection of Cucumbers and Melons, which have all been thoroughly proved, see Advertisement and Cut in the *Gardeners' Chronicle* of January 13, 1855.

Sir Colin Campbell	... ...	3s. 6d. per packet.
General Canrobert	... ...	3 6 "

A packet of either of the Melons mentioned in the former Advertisement will be given to the Purchaser of the above two Cucumbers. A remittance in cash or penny postage stamps must accompany every order, and the whole or any part (as the case may be) will be immediately forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somersetshire.

The Gardeners' Chronicle.

SATURDAY, JANUARY 27, 1855.

The following stereotyped paragraph, we suppose proceeding from the Treasury, has appeared in such of the morning papers as would insert it.

"The instructions to the surveyors (Messrs. J. Mathews, W. Murton, and W. Menzies), appointed by the Treasury to report on the royal forests maintained for the growth of navy timber, with their reports thereon, have been laid before parliament. After having delivered five separate reports, referring to questions which had arisen with respect to various details of management, the surveyors were directed to frame a general report regarding the condition, management, capabilities, and future prospects of the royal forests they had visited—viz., Alice Holt, Woolmer, Bere, Parkhurst, New Forest, Dean Forest, High Meadowwood, and Delamere. These forests contain altogether about 103,150 acres, but the surveyors consider that the beneficial interest of the Crown may be represented by about 30,000 acres of young plantations; and not only, they say, is the state of those plantations "such as to merit approval, but, having reference to their regularity, growth, and prospective ultimate development, they are not surpassed by any forest property in the kingdom." A calculation of their value leads the surveyors to the conclusion that they were 'a profitable and most advantageous investment of public money, though for the first period of their growth they appear to make but small return upon their original outlay.' The surveyors are of opinion that the present local management is carried on with skill and ability; they deprecate the system of thinning with reference to annual profit, instead of ultimate crop; and they also object strongly to the system upon which timber is now supplied to the Royal Navy, as that department 'should not be permitted to require more than the forests can supply consistently with a due consideration of their permanent welfare.' They express their belief that at the end of another century the navy will be mainly dependent upon these forests for its supply of timber; they point out the mistake which has been committed in taking so much large timber from the forests within the last few years, during a period when the price has been unusually low; and the report concludes with an observation on the importance of securing the services of intelligent and thoroughly experienced gentlemen to discharge the very onerous duties of deputy surveyors."

In order to determine the value of such a document as that of which the above professes to be

ESTABLISHED ABOUT HALF A CENTURY.

BASS AND BROWN'S NEW SEED LIST

IS NOW READY,

AND CONTAINS EVERYTHING WHICH CAN BE DESIRED OF THE CHOICEST, NEW, AND OTHER VEGETABLES.

Considerable attention is paid to grow only the finest sorts for sale, and our Collection is very select.

ASSORTED COLLECTIONS OF VEGETABLE SEEDS.

The following, of the very best in cultivation, cannot fail to give the most complete satisfaction.

No. 1, Collection for a large garden, containing quantities sufficient for one year's supply	£3	0s.	0d.

*** Sangster's No. 1, Daniel O'Rourke, Hair's Dwarf Mammoth, Early Emperor, or Fairbeard's Conqueror, Burbidge's Eclipse, Champion of England, and other best sorts.

The List of FLOWER SEEDS will also be found, as usual, very select. Goods Carriage free (not under 20s.) to all the London Termini, and all Stations on the London and Norwich Colchester Line.

SEED & HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

the substance, it is indispensable to ascertain the competence of the parties from which it proceeds to report upon the matters referred to them. Who are Messrs. MATHEWS, MURTON, and MENZIES?—these new advisers of the Treasury. Upon that point we can learn very little. Nobody knows much about them. One is said to be or have been connected with railway transactions; another is, we are told, a Kentish timber dealer, or something of that kind; the third is a deputy surveyor in Windsor Forest. What their qualifications are for so difficult and responsible a duty as that of reporting on the Royal forests, for which not only great knowledge of foresting, but perfect independence of character is indispensable, we are not informed. Why they were selected in preference to men of high public character and unquestionable knowledge, such as Sir JOSEPH PAXTON or those he could have named, is an enigma. Why they have been employed to supersede Mr. CLUTTON is equally unexplained, though perhaps not unintelligible. Mr. CLUTTON, however much we may have felt it necessary to differ from him respecting his reports, is, at all events, well known as a gentleman of high professional standing and indisputable intelligence. It would have been useless to ask him to join in that intrigue which was contrived to ruin Mr. BROWN, in order that the Deputy-Surveyorship of Dean Forest might be once more at the disposal of some nameless personage in the Government. Tools of a different temper were required, and were found.

The reports before us consist mainly of assertions as to matters of fact, the value of which can only be ascertained by personal inspection of the forests. They are intended to contradict other assertions made by Mr. BROWN, which, nevertheless, they every now and then confirm. The aim of the reporters is to depreciate the recommendations made to Mr. KENNEDY, and to extol the management which compelled the late commissioner to look around him for the advice of a better man than any of the forest officers. We also find ourselves in a cloud of opinions and general statements, in which everything palpable or well defined, by which to judge of the real knowledge of the reporters, is carefully suppressed. At one or two points, however, they fortunately descend to particulars, and thus inadvertently furnish a scale by which their knowledge of what they have been employed to advise upon may be exactly measured. We shall presume to apply that scale, at the same time assuring our readers that the following passage is a literal extract from the report, the italics only being our own:—

"We believe that no difference of opinion now exists as to the mischief which inevitably follows the amputation of a living branch from an Oak, if the tree is destined to become timber; such practice does not now exist, and therefore it would be superfluous in us to express our condemnation of it; but the removal of decayed branches may reasonably form a subject of controversy. Dead branches are caused very frequently by injudicious thinning; but upon some uncongenial subsoils no process of thinning will protect the trees from this infirmity. Throughout the whole of the forest we found the greatest number of decayed branches upon the worst soils, and it is scarcely probable that these were the only portions which had been injudiciously thinned.

"When from *any cause* a branch dies, the decay usually commences at its extremity, and gradually approaches the main stem. The process is a slow one, *and the moment it begins, Nature sets to work to counteract the mischief.* When the sap wood of that part of the branch which adjoins the trunk begins to give way, the sap wood of the trunk closes tightly upon it, and continues to grow and press round it until the branch is altogether decayed. *It then quickly heals over, and the future growth of the tree covers altogether the base of the dead bough*, of which nothing more is seen until the tree is ultimately opened and the defective SPOT detected.

"If, however, you anticipate the gradual decomposition of a dead bough by cutting it off, *its base commence (sic) to decay*, and that more rapidly than the growth of the sap wood; *a hole for the reception of water is the consequence*, and an injury which the constitution of the tree cannot overcome. *We are decidedly of opinion that all trees should be left entirely to themselves, and no decayed branch removed on any pretence whatever.* If a tree is of so weakly a constitution that it cannot overcome the effects of decayed branches, it can never be worth growing, and should be taken down at once."

It would be difficult for any set of men to stultify themselves more than by putting their names to such a statement as this. It is certain that those who drew it up must be unacquainted with everything which a forester should know. The deputy-surveyors must themselves feel scandalised at being *patronised* by people capable of displaying such an incredible amount of ignorance. These gentlemen say that when trees become stag-headed from old age, "Nature sets to work to counteract the mischief;" they say further that when a branch dies, the sap wood of the trunk closes over it, and covers the base of the dead bough, so that nothing but a defective *spot* remains. They do not know what causes the faults in deal; it has never occurred to them that in this common timber the loose knots which tumble out (as at A) as soon as it becomes planks, are the consequences of the sap wood having closed over dead boughs, so that "nothing more is seen until the tree is ultimately opened." It would seem as if they thought it immaterial what the condition of timber is, provided the tree shows fair outside. Let us advise them to make some inquiries on this subject in Her Majesty's dockyards, of which, by the way, they seem to entertain a wholesome dread. Mr. BENNETT, the sensible and experienced timber inspector at Portsmouth, could, we suspect, enlighten their understandings. In the meanwhile, the example next represented may help to show them what the real effects are of leaving decayed branches on timber trees. It may possibly also throw light upon the future quality of the timber to be expected from the Royal forests, after they shall have been managed for a few years under the intelligent advice of the experienced *practical* gentlemen whom Mr. WILSON has introduced to the Treasury.

There was once a really great forester, JOHN SANDYS, of whom we suppose Messrs. MATHEWS, MURTON, and MENZIES, never heard. For their information we will acquaint them that it was he who created the magnificent forest property of the present Earl of LEICESTER. And what does SANDYS say about leaving dead branches upon living trees:—

"There is a method of pruning still practised by some persons, of leaving a foot or more of the branch on the tree *to die and rot off*, which if only an inch in diameter may take several years to accomplish, during which time the stem increases, *and when the stump falls down, a hole is left as deep as the tree has grown since the snagging, which hole must have time to fill up after the rotten branch is gone.* The *healing of the wound is consequently delayed, and the defect in the timber greater.* Instead of taking off a large branch by the stem, a great part of it may be cut off at a distance from it, leaving a small side branch to draw the sap and keep it alive, which is better than leaving a snag; but this method should seldom be practised, being only the result of former bad management."

There is a certain Sir JOSEPH PAXTON, of whom it is possible that the new Treasury agents have heard. Some think that he knows as much as most men about foresting; and what is his recorded opinion?

"All scientific planters," wrote Mr. PAXTON some years since, "agree as to the propriety of removing dead or decayed branches. Whenever dead branches are found on any tree, they cannot be too soon removed; and even Fir plantations, which when thickly planted are generally self-pruned, *will be improved* by having all the dead wood pruned off quite close to the stem."

In the University of Cambridge there is, and we trust long will be, a professor of Botany named HENSLOW. It chanced that some years since Lord BRAYBROOKE submitted to his examination a number of specimens of timber in which the branches had been allowed to die back. The result of that examination, now before us, was as follows:—

"In the specimens sent for my inspection, the fore-shortened branches were all in a *state of decay*, and where the experiment was pronounced complete, the stumps had become embedded in new wood which had closed over them, exactly as it does over the surface of the cut produced by close-pruning. Now the only difference between the two results appears to me to be this: that *in the close-pruning we have two clean surfaces, the one of the old and the other of the new wood*, brought into close contact; whilst in the case of the fore-shortened branch, *we have the decayed remains of a rotten stump surrounded by an irregular surface of the new wood.*"

So much for the common sense of Mr. WILSON's friends as regards pruning timber. Here is another bright example:—

"The plea has been, that much timber having arrived at maturity, was deteriorating in quality. This is no less a mistake. A tree which has flourished from two to three centuries and arrived at full maturity, *will suffer no material deterioration for another 40 or 50 years.*"

That is to say, it will not rot at the heart, nor become "short" nor "foxey," nor undergo any organic change which will reduce its value in the timber market. According to this doctrine the Larch does not begin to rot when the first symptoms of decay appear in its extremities; nor should it then be felled, for its getting more and more rotten every year causes "no material deterioration." According to Messrs. MENZIES, MURTON, and MATHEWS, a tree is none the worse for becoming stag-headed, and there is no chance of a break up of its tissues for 40 or 50 years. *A fortiori*, a tree that has died outright is as good for timber as one that is felled in its prime. Is this the sort of stuff that Messrs. MURTON and MATHEWS sell to their customers? We hope not. Is this the timber that Mr. MENZIES, himself a deputy surveyor, would send into the dockyards? We presume their recommendation is founded on the principle that what is good for trade is good for everything else. Bad timber soon perishes, and the workman who used it will soon have a new job in replacing what has decayed.

The more timber is old and exhausted, the further it is beyond its prime, the more it is subject to dry rot; and it is the timber which is most subject to dry rot that these new advisers of the Crown recommend should be purveyed for the navy. "Lorsqu'un arbre est couronné, plus il vieillit, moins il est propre aux ouvrages de construction; il faut donc l'abbattre pour en tirer parti, à moins qu'on ne veuille le conserver pour profiter de l'étendue de ses branches et de l'ombrage qu'elles procurent." So says a great and experienced continental writer, so says science, so says common sense. But that is not the opinion of Mr. WILSON's agents.

Surely it is a national disgrace that the great departments of the state should thus be at the mercy of men who have not enough knowledge of the commonest things to learn even how to select their agents. We see the consequences everywhere; our system is utterly rotten; everybody is taken

for exactly the duties he least understands, and the inevitable result is what we now see in that Crimean operation, which, notwithstanding the magnificent courage of our heroic troops, has become the pity of the French, the disgrace of ourselves, the derision of everybody else.

On a former occasion we called attention to some extraordinary instances of ignorance of the commonest facts of Natural History, which had appeared in certain articles of one of our leading reviews, in other respects by no means deficient in ability; and we did so because it indicated some radical defect in the education of a large and very important portion of the community. Another instance has just fallen under our notice, and as the same defect is indicated in a thousand directions, and if we may judge by the sneering though personally complimentary remarks of a medical journal of extensive circulation on the appointment of Mr. Busk and Dr. Hooker, as examiners by the Indian board, there is an indisposition in some quarters to mend matters, we are at least willing to record our own sentiments by the production of the passage, which we should not feel inclined to do if the utter want of knowledge of such subjects which it evidences was less glaring. Were we inclined to be hypercritical, two other passages* might be adduced from the same review, but the one in question is so marked, that it wants no corroboration. It occurs in an article entitled "the London Commissariat," which treats of the different sources from whence the alimentary wants of the metropolis are supplied. Speaking of Strawberries the reviewer says "Mr. Myatt, of Deptford, is the great grower; by judicious *grafting* he has produced from the old stock half-a-dozen different kinds, the most celebrated being the British Queen, which attains a prodigious size." Now, we are not disposed to deny the possibility of grafting one kind of Strawberry upon another, though the attempt might be attended by some formidable practical difficulties, but every one acquainted with the simplest principles of horticulture is aware that new varieties, except such an accidental case as that of the Laburnum, partaking of the twofold nature of Cytisus Laburnum and Cytisus purpureus, could not by any possibility arise from the process. Nor can we suppose that by a mere slip of the pen the word "grafting" has been written instead of crossing, because the word "stock" which follows depends upon the previous keyword. It is in point of fact most clearly a part of that educational deficiency which makes our upper classes so often the prey of every pretender to knowledge, and which leads to such disastrous issues in so many public undertakings, both at home and abroad. Self-interest indeed and a habit of jobbing are often concerned, but powerful as such influences may be there can be no doubt that the ignorance we speak of is their most efficient handmaid, and that in many cases better knowledge would render the probable result so notorious as to prove an effectual prevention.

New Plants.

III. Bolbophyllum lasianthum, *aliàs* Anisopetalum lasianthum, *De Vriese ic.* 249 *ined.*

B. (*bulbosum, repens, spiciforme, sarcanthum*) foliis latis oblongis coriaceis scapo valido laxè vaginato æqualibus, racemo pubescente, floribus carnosis, sepalis oblongo-lanceolatis acuminatis lateralibus longioribus setis piliformibus carnosis vestitis, petalis linearibus setaceo-acuminatis multò brevioribus, labello linguiformi angusto marginato basi crassissimo cristâ ovali foveatâ, columnæ angulis acutissimis integris.

The first knowledge we had of this remarkable plant was from a coloured drawing, from Sumatra, shown us by our learned friend Prof. de Vriese. It has now been examined in a living state, a specimen said to have come from Manilla having flowered with Mr. Loddiges. It is almost the largest species known, the leaves measuring fully 7 inches by 2, the scape being somewhat taller and the flowers nearly 2 inches long. The latter are dull purple, and copiously covered with long fleshy hair-pointed bristles. It evidently belongs to the group formed by *B. Careyanum, quadrisetum, setigerum, Khasyanum, nilgherrense, imbricatum, &c.*

VEGETABLE PATHOLOGY.—No. LVI.

251. Sterility.—*Accidental and Functional.*—We have hitherto considered those cases of sterility in which the malady is as far as can be ascertained wholly independent of outward causes, and due solely to some peculiarity of constitution, whether purely functional or inducing evident organic change. But sterility depends frequently on external causes, where there is no natural tendency in the plant to such a condition, and these when known are, under certain circumstances though by no means always, more or less within the control of the cultivator. The formation of fruit is the main end of vegetation, and requires a great exertion of force for its accomplishment. This is frequently so great, and the consumption of nutritive matter so complete, that life ceases in consequence of exhaustion with the perfection of the process. It can easily be understood therefore, that although a plant may flourish to a certain extent, and produce its annual crop of leaves, or even proceed to some imperfect transformation of them, outward circumstances of climate and situation may be such as to prevent the perfection of the fruit. This is the case with many exotic plants in our stoves, which rarely, if ever, produce anything more than foliage. In all such cases the skill of the cultivator which has at last produced promise of fruit in the Mangosteen, an instance apparently the most hopeless, will at length, in all probability, be crowned with success, wherever it may be thought necessary to make the necessary expenditure of time and labour, in addition to all those appliances which cannot be supplied without ample pecuniary resources. As regards mere acclimatisation, little can be done except by the production of new varieties more hardy than the original or more adapted to the peculiar state and order of the seasons.

252. One great difficulty, whether in cultivation in the stove or in the open air, is due to the impossibility of giving the same rest, whether arising from heat or cold or drought or moisture, which the plants possess in their own country. The want of this even in the absence of any climatic excess, which may be injurious to life, is often such as to preclude successful cultivation. Our northern fruit trees, for instance, when removed to tropical or subtropical climates are not able to endure the constant state of excitement to which they are exposed, and at the best produce a continued succession of leaves without fruit, while many of them are unable to linger through more than a very limited number of seasons.

253. The separation of the sexes in many species is a necessary cause of sterility where one sex only is in cultivation, as in the common Aucuba, the Weeping Willow, and some other less familiar instances, but even where both sexes are in cultivation, impregnation may not take place from the absence of proper insects which in the native country effect this process. The Vanilla, for instance, remained barren under cultivation till it was artificially impregnated by Professor Morren, and the process is now performed by many gardeners, the trouble being amply compensated by the value of the produce, which is quite equal, if not superior, to the best importation.

254. But sterility is often induced in the more common objects of cultivation by outward circumstances of various kinds. The floral organs are greatly altered or influenced by the nature and condition of the soil. Anything which induces a weak state of health or an imperfect assimilation of sap, leads directly to weakness of the reproductive process in plants.* Witness the infertility of badly drained orchards or fields, against which the most liberal cultivation in other respects is not able effectually to contend.

255. Excess of nourishment again will often produce sterility where there is no constitutional tendency to it. In this case rank shoots are produced, without the formation of flower-buds, and the flower-buds themselves when expanded do not perfect their pistils. Even without artificial manure, the supply of raw nutriment from the soil is so rapid as to produce the same effects, for fertility does not depend on the immediate supply of nutriment, but on matter already deposited.† The precise mode in which this is regulated will perhaps never be known; but in such cases experience shows that plants may be forced into fruit by root-pruning, or by confining the descending sap within certain limits by separation of the bark, the application of a ligature, or deflection of the branches, so as to subject them to the laws of gravity.‡

256. The parasitic growth of fungi again may produce sterility by appropriating that nutriment which was prepared for the purposes of fructification. It is seldom, indeed, except where organic mischief is induced, of which we shall have to speak presently, that the sterility is perfect. Where, however, mildew is prevalent, whether externally or internally, the fruit is always more or less affected, as the farmer knows to his cost by the effœte or dwindled produce of his crops.

257. Various external causes, as wind, rain, &c., may prevent the settling of the pollen on the stigma, or may wash it off before it has germinated. So long, however, as the stigmatic surface is uninjured, such accidents are not probably of much consequence. *M.J.B.*

RHODODENDRONS: GRAFTED OR NOT GRAFTED?

This is a question of considerable horticultural importance; the communications of "J. R." induce us to offer a few facts which may assist in solving it. A series of years devoted to the culture and propagation of the Rhododendron enable us to assert confidently that there is no species or variety in cultivation which might not be advantageously grafted upon the stock of another, always supposing that a suitable stock can be found. Many of the Sikkim Rhododendrons will succeed admirably, as we shall presently show, upon stocks of the common ponticum; while if grafted on those of hybrid catawbiense, they either fail altogether, or at best merely vegetate. On the contrary, most of the hybrids in cultivation grow well upon hybrid catawbiense, and more especially so if the hybrids so grafted are strongly crossed with catawbiense. They also succeed well on ponticum; and for dwarf plants, such as are grafted near the soil, the latter is largely and advantageously employed. For standards, however, ponticum stocks are not so well adapted, and for this reason: they are readily excited into growth in spring, and if, which is often the case, after being so excited, we have severe frosts, the bark, being full of sap, bursts by expansion, causing of course the death of both stock and graft. Stocks of hybrid catawbiense are not found to suffer in this way, consequently it is largely employed as standards to graft hybrids upon.

Your correspondent "J. R." thinks that maximum would be a good stock, grounding his theory upon the fact of the species being a large and robust grower. In practice it is found to be the worst of all stocks, and very few kinds will succeed upon it. Again, campanulatum will not grow on ponticum. It will certainly make a feeble union with the stock, but it merely vegetates, and never makes a creditable plant; while on hybrid catawbiense, it grows tolerably well; but as yet no stock has been found to suit it well. Among the Sikkim Rhododendrons, glaucum, cinnabarinum, and ciliatum may be named, for which a suitable stock has not been found; and while Dalhousiæ, Edgeworthi, and many others luxuriate on ponticum, they refuse to flourish on hybrid catawbiense.

Of the relative degree of luxuriance between grafted plants of the Sikkim Rhododendrons and others on their own roots, age and all other circumstances being equal, we subjoin a few examples:—From a number of seedlings of Dalhousiæ, four years old, a few were selected, cut down, and the shoots separated into single eyes, and grafted on ponticum stocks. In one year these grafts made shoots from 12 to 16 inches long, having leaves 6 inches long by 3 inches broad. The remaining seedlings are now not more than 14 inches high, though five years old, and in every way less luxuriant than the grafted plants. We have a very fine specimen of this plant five years, grafted on a 3 feet ponticum stem; the head is 2½ feet high by as much through, having six large flower buds. We need hardly say that a seedling of the same age, under the best treatment, would not bear comparison with this plant. When this one was grafted, 25 others were inserted on hybrid catawbiense stocks. There is now one alive, and that but a sorry specimen. Edgeworthi also grows rapidly on ponticum, yet it will scarcely live on hybrid catawbiense. A specimen four years grafted on the former has now 12 flower buds, and another nine. The shoots made last year on these plants are 15 inches long; while others on their own roots, and of the same age, make about 4 inches of wood in a season, and are in every way inferior, both as regards health and general appearance.

With the ordinary garden hybrids there is also the same advantage apparent, both as regards luxuriance of growth and precocity and abundance of flower of grafted plants over others on their own roots. We have now a batch of seedlings, four years old, the best of which are about 12 inches, having at most but two or three shoots—many of them only one. When these plants were one year old a number were selected from among them, from which the tops were taken off and grafted upon ponticum stocks. They are now from 12 to 22 inches high from the graft, and from 12 to 18 inches through the head, and many of them have from two to a dozen flower-buds. The seedlings have not a single bud among them. Some of the other objections raised by "J. R." we shall allude to in another article. *Standish & Noble.*

COMMON THINGS.

Early Peas.—The following mode of producing these has been practised with success. Cut turves 2 or 3 inches in breadth and 18 inches in length, turn them upside down, make a small mark lengthwise in the turf sufficient to hold one row of Peas. Place them on a hotbed or in a pit with a little heat, then sow the Peas. Two ordinary lights will hold about 50 yards. Sow about the 1st of next month, and plant out on the first favourable opportunity in March.

Composition for Fruit Trees.—The subjoined has been found of use in protecting the buds of Gooseberries from the ravages of birds in the winter and spring months, as well as an effectual remedy for clearing the bark of fruit trees generally from Moss, Lichen, and the larvæ of insects:—Take hot lime and soot in equal quantities; add cow's urine until the mixture has attained the consistency of thick paint. Paint the trees regularly over with the ingredients thus prepared, and the result will be not only a beautifully clean and clear bark, but an increased vigour will also be perceptible in the growth of those trees to which the mixture has been applied.

Propagation of Tropæolum tricolorum.—The simplest mode of doing this is to take off the weak laterals that are not likely to flower, when about 2 inches long; if with a heel so much the better. Any time from

---

* The two passages in question are contained in p. 295 of the review.

* It is well known that in some conditions of the animal system which tend to ultimate death, as in persons of a strumous habit, there is an increased productiveness, but that when those peculiar functions cease death ensues very rapidly. Something similar or rather something analogous obtains in fruit trees subject to gumming. They are often peculiarly productive just before dissolution. A large crop is formed and perhaps ripens, and vitality is exhausted by the effort, the small connecting thread of living tissue being unable to keep up the necessary supply.

† Many fruit trees bear only every alternate year, an interval of rest being requisite for the deposition of new fruit-producing matter.

‡ Sterility may arise from a precisely contrary cause, viz., the over-production of flowers, the strength of the plant being so exhausted as to prevent fertilisation. This case, however, will come as a consequence under another head.

February till May fill the pot half full of crocks, then with a mixture of peat and sand till within 2 inches of the top; fill up with silver sand, and water with a fine rose to settle it. Then dibble in the cuttings all round, within 1 inch of the rim, leaving about half an inch of the cutting above the sand. Place the pot on a shelf in the front of the greenhouse; keep the sand constantly moist, taking care that the cuttings are always erect. In the course of two months many of them will throw up shoots from under the sand. The pot should then be removed to a shady situation out of doors. When the stems decay, do not disturb the sand, but water sparingly. In October let them be placed in the greenhouse, when all that have made small tubers will grow. It is from these plants that the best cuttings are obtained in the spring. In the following May turn the whole ball out of the pot in a warm situation in the open ground. After they have finished growth take them up and sift the ball through a fine sieve, carefully picking out the tubers. They are then treated in all respects as the older tubers, and will make fine flowering plants the following spring. If seeds are used they should be soaked in water 24 hours before sowing, and the outer shell carefully removed; under this treatment they will grow much sooner and with greater certainty. They should remain in the seed pot until after they have formed a tuber. A small stick can be placed against each plant, to which it will climb, and it serves to indicate the place of the tuber when the stem is dead. Many seeds will remain 12 months before vegetating.

Wood-lice.—By the following simple method, frames and pits might be kept comparatively free from these intruders; at all events, they might be so far subdued as not to be injurious to plants. Put a cold boiled or roasted Potato into a small flower-pot; cover the Potato with Moss, leaving a little hanging out of the pot by way of enticing the insects to enter; then lay the pot on its side in a corner of the frame. Wood-lice feed in darkness, and at the approach of day they retire to their hiding places in cracks and crevices, or amongst the loose soil or bark; the Moss is therefore necessary to induce them to remain in the pot, to which they will flock in hundreds after having once tasted the Potato. Every morning the pots should be taken out of the pits and the wood-lice destroyed; the same bait will serve for a week or longer. If properly attended to, half-a-dozen pots so prepared will soon clear a frame of these troublesome pests. A toad or two is also of great service in thinning their numbers.

CHOICE OF PEAR SEEDS, THEIR PRESERVATION, AND TIME OF SOWING.

THE essential properties of a new variety of Pear exist in a rudimentary state in the seed. Time and favourable circumstances will develope the embryo plant, but cannot change its specific nature. Its existence dates from the time that the pistil is fertilised by the pollen before or after the opening of the corolla. In dissecting a flower before the corolla is open the anthers are found close to the stigma, and at the base of the style the rudiments of the ovaries may be observed. Does fertilisation take place before the opening of the corolla, or more probably not till after the solar rays have produced certain effects on the organs of fructification! Are the anthers of the same flower sufficient for the fertilisation of the pistillum without the assistance of other flowers, or perhaps the flowers of other trees, the pollen of which may be deposited by bees or flies!

The minute examination of these questions is of importance, and will lead to a knowledge of the mode in which artificial fecundation may be effected in certain circumstances, and of the precautions necessary to be taken. Perhaps in this way more certain results may be obtained in regard to obtaining long-keeping varieties, an endeavour which ought to receive the particular attention of those who engage in raising varieties of fruit from seed.

Seedling varieties of Pears vary infinitely in successive generations. This truth is being continually proved by ocular demonstration. There is another principle connected with the above, which is, the more a type has entered into a state of variation, the greater is its tendency to continue doing so, and the more it has varied from the original type, the more it is disposed to vary still farther.

Certain latitudes and influences of climate are doubtless more favourable than others for obtaining good results as regards the Pear and other fruit trees; but the investigation of these would lead us too far from the principal subject.

It is rare to see two identical varieties produced from seed of the same variety. It is even a well-established fact that the seeds taken from the same fruit produce varieties so distinct in wood, leaves, and fruit that no resemblance to their common origin can be traced. This fact proves to a certain extent that the bees and flies play an important part in the fertilisation of the pistil. It is therefore important, that in a garden where experiments in raising new sorts are carried on, no varieties should exist except those that are of first-rate quality; and that the collection should be as far distant as possible from any bad varieties. It may be supposed that when the bees fly to a distance, the pollen is detached from their legs by the action of the air; therefore we must attribute the complete fertilisation of the flowers of a tree to the pollen of adjoining trees that are visited by bees and flies. The consideration of these circumstances ought not to be omitted. Moreover it is essential to have only vigorous trees, on the Pear stock, obtained from the latest generation of improved seedlings.

A limited number of fruit should only be left on the tree, from which seedlings are intended to be raised, in order that the fruit may acquire its natural size and perfection. When gathered, the finest should be selected from spurs on the most vigorous part of the tree. The fruit should be kept in a suitable place till it becomes quite ripe.

In cutting the fruit care should be taken not to injure the seeds, of which three, four, or five may be found, perfectly matured, in the cells. Whether the seed is roundish, flat, oval, or oblong, or whether its colour is black or nut-brown, provided it has a well-fed pulp, it may be considered fertile and ought to produce a plant, if preserved with care and sown at the proper season.

When taken out of the cells, the seeds should be put in a small jar, half filled with dry sand, with which the seeds should be mixed. The jar should be placed in the dark, where the seeds can neither dry nor rot. After remaining in this situation for a month or two, the seeds should be taken out and put in papers, each sort separately, marking the name or number of the variety of fruit from which the seeds were taken, together with the date of the ripening of the fruits. These directions, it will be understood, are necessary, in order that amongst the seedlings raised the preference may be given in planting to those likely to prove the best. The seed is collected from the middle of autumn till the end of spring; and by keeping it in the way above-mentioned the skin of the seed will acquire a consistence, and the kernel a firmness that will enable it to vegetate with greater vigour when committed to the soil, in the open air. I have seen Pear seeds sown in garden pots, in wooden boxes, and on gentle hotbed; but from many years' experience I have found that it is preferable to sow the seeds in the open ground. They grow in the latter during the first year with the proper degree of vigour, and make a substantial growth. In September, a part of the garden is chosen which is not infested by any kind of insect. The ground is dug deeply but not manured. It is carefully cleaned from all weeds, and at the same time the soil is made as fine as possible. About the end of the month drills are made 2 feet apart and about 2 inches deep. After the bottoms of the drills have been levelled a thin layer of wood ashes is sown in them. The seeds, preserved since the winter or spring, are steeped in a solution of sulphate of lime, and placed about 2 inches apart in the drills. A strong Oak stake is driven into the ground to mark where each sort is sown; a piece of lead is nailed on the stake and stamped with the letter S, and the number of the variety sown. Before covering the seeds, they should be pressed on the flat side or on the edge with the finger, in order that the radicle may strike directly downward, and the plumule spring upwards without proceeding first in a horizontal direction and then forming a curve at the base of the stem, which would be the case if the seeds were not properly placed. All the drills are successively covered in the same way. During the winter and spring some parings of turf should be scattered over the surface of the ground, in order to afford nourishment to the worms and prevent them from attacking the seedlings, the seed leaves of which will appear above ground towards the end of the following March. *J. de Jonghe, Brussels, Jan.* 14.

Home Correspondence.

Nurserymens' Catalogues.—It is a great pity that no plan can be hit upon for securing correctness and uniformity in the catalogues of the leading flower seedsmen; as to the smaller fry, it is perhaps too much to expect from them any attention to such matters. I subjoin a few specimens of the confusion that prevails, selected almost at random from the lists of the present year. Perhaps you would take the trouble to determine which is the correct description.

Sweet-scented Camellia.—I should be glad to hear if any of your correspondents have in their possession or have seen a sweet-scented Camellia. I have one (a young plant) which I purchased last year when in bud. When the flowers expanded I discovered their sweetness, which resembles a very delicate Hyacinth; but for fear I might be mistaken, I had several friends who equally smelt the sweetness of the flower. A gardener in this neighbourhood, who heard of it, asked me for some cuttings; but as the plant was small, I refused to give them. And he then said, "Oh! it is only a freak of Nature; it will never be sweet again." However, it is now in bloom in my conservatory, and is quite as sweet as it was last year. I have no flowers in bloom in my conservatory but Camellias, and therefore there can be no confusion of scents to deceive me. *Violet.*

Soil for Rhododendrons.—I am astonished at Mr. John Waterer's statement (see p. 804, 1854) that Rhododendrons, &c., will grow in any ordinary garden soil, or where leaf-mould or other rich vegetable soils are in abundance. When gardener to the late P. C. Labouchere, Esq., of Hylands, Essex, I grew them with success in strong adhesive yellow clay with a spadeful or two of peat to start with, and I believe that there is hardly a county in England in which Rhododendrons are not to be found growing and increasing naturally in loam; nevertheless this does not confirm Mr. Waterer's assertion. If Mr. W. will call on me I will show him, not 100 miles from Buckingham, a rather costly experiment carried out about three years ago on the principles he promulgates, the result of which is that the plants, struggling on in what came with them, are dying a slow but sure death, furnishing a miserable substitute for a very fine orchard of fruit trees, which would have done a Knight's or a Rivers's heart good to have seen. These were cleared away by the advice of a celebrated landscape gardener, who, if deserving of the name, ought to have known better. I believe that Rhododendrons have been tried here long before my predecessor's time, Capability Brown, in leaf-mould, bog earth, &c., without success; for when I came in 1839 there was not a plant in a healthy growing state in the grounds. As the Duke of Buckingham was very anxious to get them to grow, I tried several samples of soils in the neighbourhood for them, and amongst them I found at least 500 acres of land within 2 miles of Stowe, in which they will grow as well, if not better than in the justly celebrated nurseries at Bagshot, in Surrey. I would, therefore, strongly advise admirers of this truly magnificent class of plants before they attempt to plant them extensively to collect a small portion of the various soils in their immediate neighbourhoods, to add a portion of leaf-mould and other vegetable soil to each, and what is also good cow's manure, as it is difficult to ascertain what they will or will not grow in without a trial. I trust, therefore, that this hint may induce many to grow them who have never before attempted their cultivation, and that the assertions I have just made are facts I have ocular proof to show. *David Ferguson, Stowe, Buckinghamshire.*

Holcus saccharatus.—In No. 52, 1854, attention has been drawn to a novelty of the year, in the shape of a tall reedy Grass, called Holcus saccharatus, of whose economical virtue I find that great expectations are raised. Such being the case, permit me to observe that much valuable information respecting this plant may be obtained from some of your readers in Western India, particularly from the Deccan sportsmen and officers, who use it largely, under the name of Jowaree, in preference to the coarse Grass or hay obtainable there, in feeding their hunters and chargers, which thrive well upon it—so much so, indeed, that when sent to the coast for racing purposes a supply of it invariably accompanies them. I have great doubts, however, whether this Holcus contains a sufficient quantity of saccharine matter to be converted economically into sugar, even on the spot where the plants attain their full perfection, for surely in such case Dr. White in his valuable "Materia Medica of Hindostan" would have noticed it, or we should have heard of it otherwise. The seed is used for food by natives too poor, I believe, to purchase Rice, and can be procured in India in any quantity. *B. N., Chichester.* [The French expressly state that there are doubts about the Chinese Holcus being the same as the Indian one.]

White Blackberry.—On January the 3d, 1852, a flourish of trumpets announced Mr. Needham's white Blackberries as a valuable addition to our rubaceous fruits. Having no white blackbirds hereabouts to eat them, I was in hopes they would fare better than my Raspberries. By January, 1855, this ought no longer to be a very rare plant: but I hear nothing more of it, and nowhere see it offered for sale. Pray report progress. *A. H.* [*We* have nothing to report, except that the plants sent to the Horticultural Society died. If any of our readers possess information respecting the plant we should be obliged by receiving it.]

Mr. Carton and his Family.—It will be gratifying to the benevolent individuals who contributed the money to enable Mr. Carton and his family to emigrate to Australia two years ago, to know that he has not only safely arrived there but that he has found profitable employment in gardening. A gentleman has come to this country lately who had actually employed Mr. Carton as his gardener at the rate of 7*l.* a week. I hear also that his daughter is married. We may therefore hope that all things will now go well with him. *A. Forsyth, St. Mary's Church.*

Datura ceratocaulon.—For the information of your correspondent who says he has great difficulty in raising this plant from seeds, allow me to state that, if the latter are sound and good, they will vegetate readily, if sown in a pot and plunged in a moist bottom-heat, or if sown on a hotbed and treated in the same way as other tender annuals. It must be borne in mind that this plant is a native of Cuba, and will therefore only live in the open air with us during the hottest part of our summer and autumn months. Although the

flowers are large and handsome, the plant itself has a coarse weedy appearance, on which account it is not much esteemed or generally cultivated. A good figure of it is given in Jacquin's "Hortus Schoenbrunensis," vol. 3, t. 339, published in 1798; but it was not until 1805 that it was introduced through Spain into our gardens. It is figured and described in the "Botanical Register," t. 1031, and "Botanical Magazine," t. 3352. *W. B. B.*

The Fluke Potato.—In shape this Potato is an oblong oval. Its surface is even, rather flat than otherwise; the length and diameter in a true specimen being about the proportions of 6 × 4 × 2½. When dressed for the table it is dry and floury, and of first-rate flavour. Buyers, however, must take care that they get the true kind; for there are many good likenesses of the Fluke in the market, and which are sold for it. Those, however, who have seen the Fluke once—especially when growing—will never mistake any other variety for it. The leaves are very dark green, the stems robust and erect, until they attain the height of 18 inches, when they begin to fall abroad, and grow to the length of 2 or 3 feet. When the stems first appear they are almost black; but as they progress in growth they gradually change to a dark green. This variety should not be planted at a less distance apart than 2 feet betwixt the rows, and 1 foot in the row. If planted closer the produce will be small though abundant, and much deteriorated in quality. That is the distance for ordinary cultivation, and if the soil is a rich light loam, 1 sack of 2 cwt. to the rod may be safely calculated upon. Several growers in this neighbourhood have realised this produce in good garden ground, all sound and good, and 95 per cent. large and fit for table. As regards size of tuber, the ordinary produce is from 9 to 3 in. in length, with the proportion before given. The Potato disease has but little influence on the Fluke. Those planted in February of last year, in this locality, showed no symptoms of attack throughout the growing season, while Regents, Prolifics, Forty-folds, Champions, Cups, &c., were all cut down in June and July, and the tubers were much diseased. The Flukes, on the contrary, remained green and healthy until September, and the tubers, with very trifling exceptions, were perfectly ripened and sound. Indeed, the fact is all but universally acknowledged that no Potato resists the disease like the Fluke. *G. Dickson, Lawrence Hill, Bristol.*

Societies.

Linnean, *Jan.* 17.—The President in the chair. The following papers were read:—1. Extract from a letter addressed by Rev. W. H. Hawker to the President, relating to the discovery of several new localities for some rare Ferns and shells. Mr. Hawker writes as follows:—"Last year I paid a visit to the English lakes, and had the good fortune to find Polystichum lonchitis growing near Ulleswater. I brought away one plant, and sent a frond to Newman, who, however does not mention it in his new edition. This year, in July, I went to the lakes again, and had the pleasure of confirming the above discovery; and, moreover, on my mentioning it to other collectors up there, a search was instituted, which has resulted in its turning up in several new localities in that district, *e.g.*, Helvellyn, Fairfield, &c. This Fern has never before been found in the lake country, I believe. Whilst up there this year, I went a few days' botanising ramble with Mr. Clowes, of Windermere, and on one of these days whilst clambering on a terrific precipice, I had the delight to find Asplenium septentrionale growing in quantity, and right amongst them I found two plants of Asplenium germanicum! A guide was with me, who found close by Woodsia ilvensis, growing in some quantity—three good things, were they not, to be growing on a spot only a few yards square? It was on an outcrop of the iron ore, which seems to me always to be a good matrix for Ferns. This took place not many miles from Scawfell, though not on it. It was of course plain that the locality had never before been visited by a botanist. Mr. Clowes found Euphorbia Cyparissias growing on Whitbarrow fells in great quantity. I have gathered it on the mountain limestone of Somersetshire, near Wells, and should think it will prove to be a true native. * * Last September and October I took a rapid run on the continent, up the Rhine, &c. The season was late; flowers were mostly over, and deciduous Ferns killed down, so that on the Alps I did not gather Woodsia alpina as I wished. I found on the Jura in one spot my dear Asplenium fontanum. In the Pine forests of the Alps and Jura Polystichum lonchitis grows in the most wonderful luxuriance. I have dried some fronds 22 inches long. Its appearance is quite beautiful. Asplenium septentrionale, too, abounded on alpine rocks." 2. A letter addressed to the Secretary by John Hogg, Esq., on the subject of the Tunny stranded in September last at Tees Bay, and noticed by him at a former meeting. Mr. Hogg has ascertained that the fish was really a Tunny, and of very large size. 3. Extract from a memoir "on the origin and development of vessels in monocotyledonous and dicotyledonous plants," by Dr. F. F. Allemão, of Rio de Janeiro, translated and communicated by J. Miers, Esq. In a note to this paper the translator observes that Dr. Allemão, in making his observations, was desirous of testing the validity of the theory first suggested by Du Petit Thouars, and more recently modified and supported by Gaudichaud, which contends, contrary to the views of Mirbel and other eminent physiological botanists, that all woody fibres of the stem proceed from the nascent leaf-buds, and thence descend to the radicular extremity of plants. Dr. Allemão states that his observations in no way tend to support this theory. 4. Memoir on "new species of Proteaceæ," by Dr. Meisner. In the remarks prefatory to the technical descriptions which formed the bulk of this paper, Dr. Meisner remarks that since the publication of Brown's Prodromus in 1810, upwards of 400 new species have been added to the 204 Australasian species of that work, namely 163 by Dr. Brown, 48 by Dr. Lindley, and 195 by himself. The number of new species described or noticed in this paper was 66, including 12 of which characters drawn up from specimens in the Society's Herbarium had been forwarded to the author by Mr. Kippist, the Society's Librarian.

Notices of Books.

Knowledge is Power, a View of the Productive Forces of Modern Society, and the results of Labour, Capital, and Skill. By Charles Knight. London. Murray. Fcp. 8vo., pp. 436 (*7s. 6d.*)

The object of this volume is mainly to present unlearned persons with illustrations of the great principles of political economy. The author has not attempted to do this in a formal and systematical manner, which might be repulsive rather than attractive, but he has endeavoured to convey a knowledge of the fundamental laws of social progress, by adducing examples illustrative of the circumstances under which it has and has not been made.

"Without attempting to give this volume the formal shape of a treatise on Political Economy, it is the wish of the author to convey the broad parts of his subject in a somewhat desultory manner, but one which is not altogether devoid of logical arrangement. He desires especially to be understood by the *young;* for upon their right appreciation of the principles which govern society will depend much of the security and happiness of our own and the coming time. The danger of our present period of transition is, that theory should expect too much, and that practice should do too little, in the amelioration of the condition of the people."

Young persons and those who, although not young in years, are little advanced in knowledge, are too apt to regard a study of these matters as dry, uninteresting, and to them, at least, unprofitable. The sooner such an opinion ceases to be current the better, for, as has been most truly observed, "it is only in the ignorance of the people and their consequent mental imbecility that governments or demagogues can find the means of mischief;" and if there be one study which more than another is calculated to free the mind from pernicious error, that subject is undeniably what is ordinarily called political economy. Any work therefore which is calculated to dispel the notion that political economy is dry and uninteresting, and which, whilst it impresses the great truths of the science upon the minds of the young, engages their attention and induces them to read on, is certainly a boon to society. Such a work is the one now before us. It is not altogether a new production, but is a combination and expansion of two little works by the same author, viz., "The Results of Machinery" and "Capital and Labour," which have both enjoyed more than ordinary popularity. As an example of the manner in which the subject is treated, we extract a paragraph on "making good for trade:"—

"When a mob amused themselves by breaking windows, as was once a common recreation on an illumination night, by way of showing the amount of popular intelligence, some were apt to say they have "made good for trade." Is it not evident that the capital which was represented by the unbroken windows was really so much destroyed of the national riches when the windows were broken?—for if the windows had remained unbroken, the capital would have remained to stimulate the production of some new object of utility. The glaziers, indeed, replaced the windows; but there having been a destruction of windows, there must have been a necessary retrenchment in some other outlay, that would have afforded benefit to the consumer. Doubtless, when the glazier is called into activity by a mob breaking windows, some other trade suffers; for the man who has to pay for the broken windows must retrench somewhere, and, if he has less to lay out, some other person has less to lay out. The glass-maker, probably, makes more glass at the moment; but he does so to exchange with the capital that would otherwise have gone to the maker of clothes or of furniture: and, there being an absolute destruction of the funds for the maintenance of labour, by an unnecessary destruction of what former labour has produced, trade generally is injured to the extent of the destruction. Some now say that a fire makes good for trade. The only difference of evil between the fire which destroys a house, and the mob which breaks the windows, is, that the fire absorbs capital for the maintenance of trade, or labour, in the proportion of a hundred to one when compared with the mob. Some say that war makes good for trade. The only difference of pecuniary evil (the moral evils admit of no comparison) between the fire and the war is, that the war absorbs capital for the maintenance of trade, or labour, in the proportion of a million to a hundred when compared with the fire. If the incessant energy of production were constantly repressed by mobs, and fires, and wars, the end would be that consumption would altogether exceed production; and that then the producers and the consumers would both be starved into wiser courses, and perceive that nothing makes good for trade but profitable industry and judicious expenditure. Prodigality devotes itself too much to the satisfaction of present wants: avarice postpones too much the present wants to the possible wants of the future. Real economy is the happy measure between the two extremes; and that only 'makes good for trade,' because, while it carries on a steady demand for industry, it accumulates a portion of the production of a country to stimulate new production. That judicious expenditure consists in

"'The sense to value riches, with the art
T' enjoy them.'"

The work is profusely illustrated with prints of machines, &c., and is well adapted for the instruction and improvement of the intelligent of either sex.

Ainsworth and Yeats; a Treatise on the Elements of Algebra. (Ingram.) This is a book of rules and examples useful enough to an ordinary schoolmaster, but scarcely adapted to the wants of those who desire to learn something more than the routine of working problems. As a companion, however, to such a work as Professor De Morgan's Elements of Algebra, the present volume may be found useful, owing to the great quantity of exercises (with their answers) given in it.

Garden Memoranda.

Messrs. Jacksons' Nursery, Kingston.—The show-house here is at present gay with Hyacinths, double Van Thol Tulips, Chinese Primroses, winter flowering Heaths, Camellias, Red Indian Daphnes, which quite scent the whole house with their delightful perfume, and the cheerful yellow flowered Jasminum nudiflorum. The latter is a most valuable shrub for winter decoration, as it requires little or no forcing to bring it into flower; and its blossoms, which are produced in great abundance, last a long time in perfection.

Between this and the other glass-houses is a straight walk, on either side of which are beds of Conifers, and among them we remarked one filled with thriving plants of Cephalotaxus adpressa, which has been proved to be perfectly hardy. Among other out-of-door plants we noticed a collection of the finer kinds of Rhododendrons in pots, all unusually well furnished with flower-buds, and in excellent condition for forcing.

To the left of this walk are two span-roofed Orchid houses filled with a well varied and excellent collection of these favourite plants. Among them the orange coloured Calanthe curculigoides was in flower, as were also Leptotes bicolor, several varieties of Lycaste Skinneri, the orange flowered Epidendrum vitellinum, the useful Barkeria Skinneri, the curious rather than beautiful greenish yellow Rodriguezia planifolia, and others. Among such as were not in bloom we noticed some thriving plants of the different kinds of Anguloa. These, it was stated, do best while growing to be kept constantly very moist at the root. There were also many fine specimens of Dendrobes, Trichopilia coccinea, which is found to succeed well in a comparatively cool house; Odontoglossum hastilabium, Insleayi, nebulosum and membranaceum, the last coming into flower; Oncidium bicallosum throwing up a strong flower spike, and a variety of Cattleya called sulphurina, which is reported to be even handsomer than C. citrina. A fine plant of Cattleya superba was just going out of bloom, and of the best variety of C. intermedia there was a large stock, as there was also of Barkeria spectabilis. Of the latter there were at least a hundred plants, all of them on blocks, hung up near the glass. Miltonia spectabilis succeeds uncommonly well here, being green and healthy, without any of that yellow colour which it generally has. Plants of Oncidium Papilio were numerous, as were also those of the useful Dendrobium formosum; Vanda Roxburghi grows strongly here, and there were numbers of thriving specimens of Aerides. Of the singular looking Uropedium Lindeni there were seven plants, together with other rare and valuable Orchids, which were intermixed with Ferns, Dracænas, Aphelandra Leopoldi, Marantas, and other plants remarkable for the beauty of their foliage, which serves to maintain a certain amount of gaiety at this dull season of the year. At one end of this house was a boxful of variegated Orchids, which were covered with long panes of glass laid loosely across the box, to which, by simply moving the panes, as much or as little air could be given as might be deemed desirable. In a damp corner Lycopodium stoloniferum was growing luxuriantly, and for such a situation few plants are more suitable or have a better appearance.

In a cool-house was a plant of Epiphyllum truncatum, quite 6 feet high, worked on Cereus speciosissimus. This rotted off at the root some two years ago; but on cutting the stem through just above the decayed part, and letting the cut surface touch the soil, it threw out healthy roots, and now the plant is as firmly established as ever it was, and has produced abundance of blossoms.

The Camellias and Azaleas in the different houses are well set with bloom, as are also the Rhododendrons, of which there are large numbers here, more especially of the Sikkim kinds. Among the latter were fine plants of Thomsoni and ciliatum; the latter, even the smallest of them, covered with flower-buds, and for spring decoration few plants are better adapted. Of yellow Rhododendrons there also promises to be a good display, the different varieties of aureum being well set with flower-buds.

In the Heath house some of the winter flowering species were in blossom, and others were full of bloom buds; with the latter depressa was unusually well

covered. In another house were quantities of seedling Heaths, consisting chiefly of triumphans crossed with other sorts.

Of Rhodoleia Championi we remarked some good plants, but as yet they have no appearance of blooming. Statice arborea, in the shape of healthy young plants, struck from cuttings, was plentiful; Crocuses in pots in heat were coming into flower. They are potted in November, and plunged in tan in a cool place, from which they are introduced into heat as they are wanted. Those in flower were Queen Victoria (white), and Sir Walter Scott (lilac striped), which is one of the largest Crocuses in cultivation. Hyacinths were also placed in heat, with a little moss thrown over them to keep their flower spikes from drawing. In the same house was a quantity of Duchess of Norfolk Rose grafted on the Manetti stock. The latter had been growing in pots, and were brought into heat and worked in the beginning of the present month. All the grafts appeared to have taken.

FLORICULTURE.

SEEDLING DAHLIAS.—The Dahlia is subject to vary so much in different situations and seasons, that great difficulty exists in gaining an accurate knowledge of the merits of each kind, especially of those which have been only seen for one season. The circumstances under which it is grown are also so various that unless you see the plant you cannot fairly judge the merits of the flower. A great deal of attention is requisite in order, if possible, to find out what particular culture a given plant has been subjected to; for example, whether the shoots have been much thinned, the flowers shaded, a great deal of manure given, or none at all, &c. All these circumstances should be inquired into, or how can we expect to get fine flowers from new kinds? The following facts with regard to new Dahlias should always be borne in mind before condemning them the second year. First, that the seedling plant is much debilitated by propagation, and therefore the flowers are rarely as good the second season as they are the first and third. This circumstance alone accounts, in a great measure, for the dissatisfaction expressed of late years concerning the merits of new Dahlias. Second, that the best flowers are obtained from those plants struck from the first cuttings produced by the mother plant, notwithstanding that they are seldom as strong as the cuttings that are afterwards produced. Third, that exciting the roots by means of a strong heat early in the spring, and striking the young plants on a strong dung bed tend to weaken the plants so treated to such a degree that they frequently require two or three seasons to recover and regain their original character. Thus it is found that good flowers are obtained with the least trouble from those plants kept in pots the first season after striking (termed by the trade pot roots), planted out the following season, and allowed to start of their own accord. Fourth, that in wet seasons manure is frequently very injurious, from its causing the plant to grow too luxuriantly, and thus to produce but few flowers; while in very dry seasons it is equally beneficial. Much more depends on a change of soil than on its composition and quality: with moderate attention good flowers may even be obtained from plants growing in brick-rubbish. Fifth, that water is a point which cannot be too much attended too; a great difference exists between hard and soft water, but still more depends on the manner in which it is applied, for one or two good waterings are much better than a small quantity given three or four times a week—which is but too common a practice among amateurs. And sixth, that taking up the roots immediately after a frost has destroyed the top is the principal cause of so many roots dying during the winter season. I would recommend the young Dahlia grower to remember these facts, which may not only be taken as rules for judging new Dahlias by, but may also save him the vexation and disappointment consequent on the production of bad flowers from new and expensive varieties. *E. B.*

HYACINTHS.—It may not be generally known that Hyacinths which are grown in water are essentially improved by a little water being poured upon the crown of the bulb after it begins to grow, increasing in quantity when the buds begin to open. The dry air of rooms deprives them of that moisture which nature affords them, either in rain or dew, to enable the flowers to expand freely; and if anybody tries the experiment in a room with a flower that disappoints his daily observation of its progress, he will find out the value of this simple application. *H.*

Miscellaneous.

Death of Mr. Joseph Myatt.—We have to record the death of this horticultural veteran, who expired on the 8th inst. in his 85th year. We need not say that he was *the* Myatt whose name has so long been celebrated as the great modern improver of the races of Strawberries and Rhubarb.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The soil in beds and borders should be examined occasionally to some depth to see that it has not become too dry for the health of the plants, for although comparatively little water is required at this season by plants growing in beds and borders, they are sometimes allowed to suffer through dryness, and when the soil is once permitted to become excessively dry, it is a work of some difficulty to bring it into a healthy state again. When it is found necessary to water the beds choose a fine morning, and give enough to well moisten the soil, using chilled water, and be careful to guard against damp for a few days afterwards by giving air, or when this cannot be done, use sufficient fire-heat to secure a gentle circulation of the atmosphere. Go carefully over the plants every morning, and remove any decaying leaves or flowers as soon as they are perceptible, for no amount of floral display will render a house agreeable unless accompanied by cleanliness and neatness. And as soon as the beauty of any of the pot specimens is over remove them to suitable quarters elsewhere, and supply their places with others in full flower; and at this season, when the garden generally is so devoid of attraction, use every available means to render this house as gay as possible.

FLOWER GARDEN AND SHRUBBERIES.

WITH the exception of pruning or thinning, and wheeling, little can be done in these departments in the present state of the ground; but as wheeling can be more comfortably and expeditiously done than when the surface of the ground is soft, any of the beds that may require renewing should be seen to at once. And any of the shrubbery borders which may require a dressing of fresh soil or manure should also be attended to, but avoid digging ground when it is covered with even a thin coat of snow. Any new work that may be in hand involving the removal of a considerable bulk of soil, cutting walks, or anything which can be judiciously done now should be pushed forward as expeditiously as possible, in order to have the hands at liberty for the ordinary routine of spring work, which will soon be demanding attention. When the hands cannot be profitably employed at out-door work see to getting an ample stock of stakes made and painted; as also pegs, tallies, brooms, &c., and put aside ready for use when wanted. The preparation of these things is sometimes omitted until they are wanted for use, and then it is generally difficult to spare time for such tedious work, therefore see that there is a sufficient stock of all such things in readiness before the busy season arrives.

FORCING DEPARTMENT.

PINERIES.—The present state of the weather will necessitate the use of a considerable amount of fire-heat, particularly where a high temperature is being maintained with the view of inducing the plants to show fruit, and in the case of swelling fruit, see that a proportionate amount of atmospheric moisture is secured, for accommodating as the Pine must be admitted to be, it is by no means benefited by a warm parched state of the atmosphere; see that none of the stock is allowed to suffer for want of water at the root. For succession stock a temperature of 50° to 55° by means of fire-heat will be sufficiently high while sharp weather continues, but it should not be allowed to fall below 50°. VINERIES.—The early house will require very careful attention, and as the Vines will probably be in bloom, the night temperature must not be allowed to fall below 60°, and 70° should be secured during the day. Secure a sweet healthy state of the atmosphere by sprinkling the floors, &c. as may be necessary, and admit fresh air whenever this can be safely done. Also attend carefully to the border, and if fermenting material is used do not allow the heat to decline, and where this is not used see that the covering is efficient, and unless a waterproof covering is used remove the snow, and do not allow this as it thaws to sink into the covering, &c., abstracting what little warmth may remain in the border.

HARDY FRUIT AND KITCHEN GARDEN.

The pruning of large orchard trees is a matter which even at the present day is too frequently neglected, and the result is that the heads of the trees get so crowded with wood as to render a crop of fruit, except upon the extremities of the outer branches, not to be expected; and the thicket of worse than useless spray, which the trees have to support, is injurious both to the size and quality of the fruit, and also to the general health of the tree. Where this state of things has been allowed to prevail hitherto, advantage should be taken of the first opportunity of sparing time from other work to give the trees a careful pruning, thinning out the inner branches severely. In the case of large branches being cut off, the surface of the wound should be neatly trimmed off with a sharp tool, and covered with a coat of paint, to prevent the wet soaking into and rotting the wood. Prepare soil, &c., that may be wanted for planting young trees, and get it laid down where it will be needed. Also proceed with the pruning of fruit bushes, &c., when the weather admits, and get manure wheeled upon the ground ready for forking in. The present frost will be of great service in rendering the ground fit for wheeling upon, and no time should be lost in getting every spare bit of ground manured. The present will also be a favourable opportunity for getting fresh soil wheeled upon ground intended to be dressed with this, but digging or trenching should not be attempted while there is snow upon the ground. See to the protection of Lettuce, Cauliflower, &c., under glass, by guarding them from severe frost; but take every opportunity of exposing such things to light and air. Attend to keeping up a succession of French Beans, and use the syringe freely on those growing in the forcing houses, as they are particularly liable to the attacks of red spider, which, if once allowed to gain a footing in a house, soon spreads and becomes very troublesome. Also introduce roots of Asparagus, Seakale, and Rhubarb, into heat at regular intervals, so as to make sure of a constant supply. Rhubarb and Seakale do perfectly well on a shelf, or the floor of the Mushroom house, where they are probably less troublesome than elsewhere.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.

The highest temperature during the above period occurred on the 1st, 1852, and 3d, 1850—therm. 57 deg.; and the lowest on the 2d, 1831—therm. 13 deg.

Notices to Correspondents.

APRICOTS: *Constant Reader.* There are many Syrian Apricots, and the Kaisha is one of the best among them.

ASPARAGUS: *J A C.* Salt it about the middle of March, making the beds quite white, and again in July. ‡

BANKING ACCOUNTS: *Y Z.* Ask the bankers themselves or else your solicitor.

DISEASES: *J R.* We have seen many cases similar to those which you have forwarded, of decaying leaves of Ixora and Camellia. The leaf of Asplenium lucidum, for it is probably that species, appears to be similarly affected, but the spots on the Pteris are somewhat different. Such affections proceed, in all probability, from a state of atmosphere which impairs the vitality of the cells in different parts of the leaves, exposing them therefore to chemical decomposition, which is more or less rapid according to circumstances. If the state of the atmosphere be the cause, it is hopeless to look for any remedy. As regards Ferns, we have seldom seen any so healthy as in a house where manure water is occasionally sprinkled on the hot water pipes, but it is a practice which requires cautious watching.—*H W.* This seems to be a case very similar to the foregoing. In that, however, the condition of the roots was healthy. Examine the roots of your Luculia, and if they are right, consider whether there is any peculiarity about the atmosphere of your conservatory likely to induce disease. If the disease arises from any general cause, as appears to be the case in the instance stated above, the only thing is to wait with patience for more favourable circumstances.—*Pine Amateur.* We have seen an affection of Pines precisely similar to that of which you have forwarded a specimen, in consequence of streams of unwholesome air arising from the rank tan at particular spots, owing to some defect in the heating. As soon as the defect was remedied the plants recovered their healthy appearance. In the case to which we allude the points of issue of the foul air were evident enough, as everything with which it came in contact was stained. Without ocular inspection it is impossible to say whether or not some similar cause may have affected your plants. It is at any rate worth inquiry. The evil is in the specimen quite superficial, and we therefore hope your Pines will not suffer materially. *M. J. B.*

DURATION OF VEGETABLE LIFE: *G W N.* There cannot by any possibility be one word of truth in the statement. We should not believe that his lordship did not know that the Dahlia is a native of Mexico, if every-day experience did not tell us that the commonest things are those about which what are miscalled the educated classes know the least.

GOLDEN YEW: *Platanus.* All coniferous plants, and the Yew is one, are to be worked by herbaceous grafting; or, in many cases, cuttings slipped off with a heel, in August, strike readily in sand under a bell-glass. But no grafted Conifer is long-lived, unless it is worked on its own species. We have no belief that Libocedrus grafted on Thuja would have any permanent value. We presume that the collection you inquire after is that of Mr. Gambier Parry, of Highnam Court, near Gloucester.

HORTICULTURAL SOCIETY'S SCHEDULE: *W B.* Apply at the Society's rooms, 21, Regent Street.‡

NAMES OF FRUITS: *A B, Banbury.* Your Pear is the Beurré Rance.

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*T T.* Odontoglossum Bictonense, Warrea discolor, a Cattleya which looks like a withered specimen of gigantea, Maxillaria meleagris, and Oncidium Wentworthianum.—*Castletown.* We are sorry to see that your inquiry was accidentally mislaid. The leaf belongs to Eriobotrya japonica, a half hardy Japanese tree, called the Loquat, the fruit of which resembles a small Apricot. In Ireland it is hardy, but it will not fruit unless in a greenhouse, where it becomes a small tree.—*W C.* We do not remember; unusual plants, not in flower, cannot be named.—*A Learner.* We cannot undertake to name cryptogamic plants having no relation to gardening. They infest your trees because the ground is ill drained, and the trees out of health.

ROSARY: *A Sub.* We see no reason why you should not have it in some open space in a wood, provided the soil is good enough. A wall made of loose stones will do as well as one of faggots for a trellis-house; probably better, because it would harbour insects less. This inquiry has been accidentally overlooked.

VINES: *Vitis.* If you wish to make certain of a crop next season cut away half the old wood this year, and half the next.—*W.* We would prune on the spur system. Now is as good a time as any for performing the operation. ‡

WOOLLEN NETTING: *A L.* It is advertised in our last week's Number, p. 47, to which we beg to refer you.‡

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE PATENT NITRO-PHOSPHATE or BLOOD MANURE COMPANY.—(Provisionally registered, pursuant to the Act 7 and 8 Victoria, c. 110.)
Trustees.
Abel Smith, Esq., jun., M.P., 2, Halkin Street, West.
Charles Dimsdale, Esq., Essendon Place, Herts.
Edward Ball, Esq., M.P., 8, Belgrave Road, Pimlico.
Major-Gen. Hall, M.P., Weston Colville, Linton, Cambridge.
John Brady, Esq., M.P., Warwick Terrace, Belgrave Square.
Directors.
James Odams, Esq., Bishops Stortford, Herts.
Robert Morgan, Esq., 72, Camden Villas, Camden Town.
Jonas Webb, Esq., Babraham, Cambridgeshire.
John Clayden, Esq., Littlebury, Essex.
Robert Leeds, Esq., West Loxham, Norfolk.
Richard Hunt, Esq., Stanstead, Deal, Herts.
John Sharp, Esq., Tower Villa, Queen's Road, Regent's Park.
Thomas Nash, Esq., Chesterford, Essex.
(With power to add to their number.)
Bankers—Messrs. Barnett, Hoare, and Co., Lombard Street.
Auditor—James Caird, Esq., Baldoon, and 9, Little Ryder Street, St. James's.
Solicitors—Messrs. Kingsford and Dorman, 23, Essex Street, Strand.
Secretary and Chymist—James Tayler, Esq., F.C.S.
Manufactory: Plaistow Marshes, Essex.
The above manure is now ready for delivery. For Wheat, Barley, and all corn crops, 7l. 10s. per ton; Turnip and root crops, 6l. 10s. per ton; free delivered to any railway or vessel in London, and supplied direct from their works, on application to
ODAMS, PICKFORD, & KEEN,
35, Leadenhall Street, Sole Agents for London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and other purposes of the best quality at a reasonable price.—Address INGLIS & CHISHOLM, Charles Street, Garratt, Manchester.

NEW AND IMPORTANT LEVELLING INSTRUMENT.

GILLESPIE'S PATENT INCLINOMETER, for Taking, Fixing, and Adjusting Surface Slopes of Lands, Earthen Embankments, Railway Gradients, &c., and the Dip, Outfall, or Rise of Drains, Water Courses, &c., and universally applicable to determine the plans and aid the execution of all levelling or sloping operations known in civil engineering.
PRICES:—Inclinometer, with mahogany frame and brass mounting ... ... £3 3s. 0d.
Do. with oak frame and wrought iron mounting 2 12 0
Light Telescope, 10s. 6d. extra.
TESTIMONIALS.
From Mr. James Gentles, Contractor—"I have for a considerable time past used Gillespie's Patent Inclinometer in extensive drainage operations carried on by me, and I have found it to be of the greatest service, in showing the minutest slope in the ground, and in saving of labour; and I could not have constructed many of the drains with any degree of accuracy without its assistance."—James Gentles, Hart Hill, by Whitburn.
Extract of a letter from John Mitchell, Esq., Stand Hill, Bathgate.—"I highly appreciate its capabilities as a levelling instrument. In level lands, where there is a difficulty in detecting in which direction the land slopes, it is invaluable."
Extract of a letter from Mr. John Turner, Surveyor, Whitburn.—"The more I have tested it the more have I appreciated its value. By this invention the power of levelling is brought within the reach of all men of ordinary capacity."
Sold by WILLIAM DRAY & Co., Engineers, &c., Swan Lane, London. Specimens and Models may be seen at their Warerooms. Also a Descriptive Treatise on the nature and uses of the Patent Inclinometer, and copies of Recommendations of its efficiency and value to be had on application.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM-ENGINES, AND COMBINED THRASHING, STRAW SHAKING, RIDDLING, AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as thrashed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. and Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading agricultural shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.
IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.
COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.
Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.
WARMING AND VENTILATING.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel,	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12 0
2½ „	long 3 „ 3 „		1 15 0
3 „	ditto 3 „ 6 „		2 12 0
3½ „	ditto 3 „ 6 „		2 18 0
4 „	ditto 3 „ 6 „		3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in.	long ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
The first Session of 1855 will begin in February. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40l. per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT,
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
John C. Cobbold, Esq., M.P. | William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S. | Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq. | Samuel Morton Peto, Esq., M.P.
Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute works of Drainage, Irrigation, Road-making, Enclosing, Reclaiming, and the Erection of Farm Buildings upon any Estates, under Settlement, Mortgage, or Disability, and without any investigation of Title, to charge the total amount of the outlay and expenses upon the property improved, to be repaid by annual instalments, varying according to the number of years over which Landowners may determine the repayment shall extend, within the limits of 31 years for Farm Buildings, and 50 years for Drainage, Roads, and other Improvements. Arrangements are also made with Landowners for the execution of the works by their own agents, and for the supply of the capital or repayment of their own advances, through the exercise of the Company's powers. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

The Agricultural Gazette.
SATURDAY, JANUARY 27, 1855.
MEETINGS FOR THE ENSUING WEEK.
THURSDAY, Feb. 1—Agricultural Imp. Society of Ireland.

THE Act for providing a metropolitan market in place of Smithfield directed the issuing of a commission to undertake its execution. If this had not been done by the "Mayor, Aldermen, and Commons" of the City of London, it would have become lawful for Her MAJESTY to issue this commission. In either case the Act declares that unless the market for the provision of which it is passed be declared open within three years and six months from the date of its enactment, the powers of the commission so issued, and all other powers conferred, shall cease and be void. That period ceases on the 1st of March; and, although the declaration in question was not published in last night's *Gazette*, yet next Tuesday's edition will be still within the period named, and no doubt the requisite announcement will appear in it, in order to keep within the law. The 10th section of the Act enables such a declaration, although the actual opening of the place should be postponed beyond the date of the declaration in question.

We are informed that the new market place in Copenhagen Fields will not be opened for use for at least a fortnight. Excepting the places for calves and pigs the arrangements are already complete.

WE are exceedingly glad to find that the differences arising out of the discussion at Tiptree, in reference to Mr. TELFER's Hay or Grass crop (as people choose to take it), are losing their personal character; and that the real question at issue—the possibility of producing profitably those prodigious growths of which Myre Mill and Cunning Park afford the instances—is at length separating itself, as it ought long ago to have done. The subject is on the list of the London Farmers' Club, for discussion at their meeting in March, and the truth will, we hope, be then related by eye witnesses, so that, whatever it may prove to be, it shall be placed beyond dispute.

Mr. TELFER's last letter, to which we shall again

direct attention, has been replied to by Mr. HAMILTON, who has done good service in this renewed agitation of the matter; for the truth has been elicited by him, if not originally stated by him. Those who have not read this correspondence will find the facts on which it has turned, given at pages 763, 825 and 843 of last year's volume. Mr. TELFER's letter is given at the last-named page, and Mr. HAMILTON's reply to it has just been published in the *Dublin Farmers' Gazette*. Mr. TELFER obtained his 270 tons of green food off 7 acres of Italian Rye-grass by manuring 3½ acres up till the second cut, and after that manuring another 3½ acres which had been sown that year, leaving the former 3½ acres to go to seed. He believes, and so do we, that the 3½ acres left to seed would, had the manure been continued there, have produced as much as the young seeds on which it was turned; and so he takes credit for having done all he says on 3½ acres instead of 7. Or, rather, he contends that it is really a question not of acreage, but of manuring; and in the case of so rapidly-growing a plant as Italian Rye-grass, we believe he is right. Nevertheless, this style of reasoning will not satisfy a matter-of-fact disputant, and Mr. HAMILTON, of course, makes good use of his advantage. He says:—

"As to Mr. TELFER's own account of his 7 acres, with all his ingenious shifting of the paternity of his crop from one 3½ acres in spring to another 3½ acres in autumn, and his liberal choice of 3½, 5½, or 7 acres, from which we are to calculate the annual produce, he only makes out 270 tons, or 38½ tons to each of 7 acres, though he *puts it all to his credit of 3½ acres*. But will this reasoning satisfy the public mind? Are farmers to have their second acres to ride out their conclusions upon as a fox-hunter has his second horse to meet him when the first is exhausted? Mr. TELFER (who informed me that the hay was all used before the 1st of November) allows that he did use two 3½ acres during the run of the season."

As to the matters of detail to which we alluded at page 825, Mr. HAMILTON says:—

"With respect to the number of hydrants, this does not affect the question at all; the proportion of 1 to 6 acres will be found everywhere else the minimum; and in the parliamentary minutes of the Board of Health there appear to be no instances quoted where the hydrants are in a smaller proportion; and if I misunderstood Mr. TELFER on this point, the printed account of his farm which he gave me, and which describes his hose as 150 yards long, was not likely to undeceive me. I only profess to give the best information I could collect from others, and with due caution, when pointing out the mode by which these statements could be checked, I expressed my own feeling that the data were unsatisfactory, and my conviction that, though large results were obtainable, certainly there was no *proof* that the result of about 100 tons of Grass had ever been obtained at three cuttings, there or elsewhere. I cannot, however, but deprecate all such controversies as the present, which I did not originate, nor do I think a *tu quoque* case worthy of the editor of the *Agricultural Gazette*, who should rather aim at supplying the deficiencies that I pointed out than defending Mr. CAIRD in his announcement as a fact, that 25 tons of hay had been realised from a Scotch acre of land. We have seen this 100 tons of green Grass shrinking back to 65 in one statement, 74 in another (Mr. TELFER's own), and, I think I have shown practically, in Mr. TELFER's case, to 38½. The conclusion I draw from this is, that there has not been weighing and measuring enough either in extent or accuracy, to enable any of us to judge what results we might count upon if we adopted the same system, and I hope that the result of all this writing may be faithful and painstaking records of the coming season's produce."

Without wishing to revive any personal discussion in connection with this subject, we must be allowed here to say that our argument was not a *tu quoque* argument at all. It was not for the purpose of proving Mr. HAMILTON to be just as inaccurate as any other person whose inaccuracy he alleged that we wrote: it was for the purpose of proving that the data on which Mr. HAMILTON's charge of inaccuracy rested were themselves inaccurate. It is a very different thing to charge equal inaccuracy on an assailant, which is what we are said to have done, and to prove his charge of inaccuracy to be itself inaccurate, which is what we claim to have done. It was not to prove anything whatever of Mr. HAMILTON that our remarks were aimed; it was to arrive at the agricultural truth which was under discussion that we inquired into the ability of witnesses and the character of their evidence.

We hope in the course of a month or two that the truth of this most important of the many important agricultural movements of the past year will be made clearly to appear. We can confidently predict that whatever the exact figures may be that represent the truth, they will be enough to astonish those who are satisfied with averages.

SEVERAL months ago a correspondent called attention to a plan of UNDERGROUND MANURING, which had been patented by Mr. WILKINS, a citizen, we believe, of London, who at Wokingham and Reading had exhibited the results of his patent method with extraordinary success. This has been done only on the small scale; and, indeed, the first expense of the plan, greater than the fee simple of the land, hinders its being done on any other. We have seen his experimental plot at Reading; it consists of not more, probably, than a quarter of an acre; one half of which has been prepared by Mr. WILKINS, and the other half treated in the ordinary method. The unfortunate circumstance connected with all these experiments hitherto is, that *both* the plots in each case have been under Mr. WILKINS's direction. That he has honestly done his best by the half which he hoped to prove comparatively a failure is, however, believed. At a public meeting at Reading which he called to exhibit the results of his practice, the large Mangolds produced by his peculiar plan were contrasted with puny roots of common cultivation grown in adjoining rows—fine grown Hemp and Flax were shown beside the stunted stems of the ordinary mode of growth, and other contrasts were exhibited. But on claiming for his method of culture the merit of these contrasts, he was met by a very reasonable scepticism as to the honesty and genuineness of these inferior samples. Were the plots which grew them really cultivated as a good farmer would?—that was what no one knew—the audience had the word of a stranger as their only guarantee, and he was likely to leave them unconvinced. It was fortunate for Mr. WILKINS that his proceedings had been watched by Messrs. SUTTON, the seedsmen, of Reading, whom everybody in the audience knew and trusted; and when Mr. MARTIN SUTTON, in the midst of all these murmurs of incredulity, stood up to bear witness to the honesty of Mr. WILKINS's account, the reality of the experience which he related, and the genuineness of the specimens which he exhibited—the people felt at once that here was the missing link by which alone the chain of evidence became complete; and the credit of the speaker saved.

The farmers who listened to his statement went away convinced. That is to say they believed that by laying an impervious floor, whether by brick, cement, or what not, some 20 or 30 inches below the surface of the soil, and upon that floor laying parallel rows of pipes at intervals of several feet, replacing the original soil over all, and preserving by upright pipes communication between the horizontal rows of pipes and the surface of the ground; by then pouring in liquid manure from above, and saturating the soil with it from below upwards—for this is Mr. WILKINS's method:—by adopting all this system, at a cost of some 100*l.* to 200*l.* per acre, the most marvellous increase of fertility is obtainable. That was what they believed and what we believe, and what every one, no doubt, is ready to believe. But how many of that agricultural audience went home to put the plan into operation? Of course, not one: it is not likely that they should. If we had 150*l.* per acre to spare upon our farm we should invest it in the purchase of our occupation, not in improving its fertility for another at this expensive rate.

Mr. WILKINS is an indefatigable and enthusiastic man. He holds meetings in Oxford Town Hall, at the London Tavern, and wherever he can find an audience. He urges his plans with the utmost confidence, and is gaining all the support which energy and activity command. At the Oxford meeting, last week, a considerable sum of money was subscribed for a trial of the plan upon one acre of ground, and the terms on which the patentee was prepared to negotiate with any county association who would carry out his plan were made known. The scheme, so far as that programme describes it, seems to be intended merely for garden application, and it could not be otherwise. Cottages with gardens under 5*l.* 5*s.* annual rent are to pay one penny per annum, and houses with gardens under 20*l.* a-year 7*s.* 6*d.* per annum for license to adopt the system. It may be worth while trying the experiment for its possible horticultural results; it may, perhaps, be worth while even in an agricultural point of view, to determine the question of the usefulness to plants of so artificial a treatment and supply of food, but that it will ever be of direct use to the *farmer* we do not believe; and if an energetic man shall divert, by his representations, the attention of improvers from more feasible plans of agricultural improvement, he will do mischief by calling their attention to this subject.

IT is interesting to compare THE IMPORTS of corn during the autumn months of the past year with the imports of previous years during the same season, as illustrative both of the productiveness of the past season here and of the diminished ability of other countries to supply us. To what extent that disability has arisen from the entire cutting off of certain sources of supply, from the difficulty of obtaining means of transport, or from bad harvests in other countries, we do not here inquire. The main facts are that since September 5, 1854, to January 5, 1855, the imports of Wheat have been 396,340 quarters, and of Flour 255,785 cwts.; the quantities imported in the similar months of 1851, 1852, and 1853 being 755,428—1,389,661—and 1,839,447 quarters of Wheat, and 1,541,863—991,758—and 1,709,197 cwts. of Flour respectively. Take into account the high prices which have this year failed so extraordinarily to attract supplies, and we must believe that all of the causes indicated have combined to produce so remarkable a result. As indicating the relative growths of this year and of last, we may mention that since September the amount of sales of English Wheat officially recorded has been 1,674,166 quarters this year against 1,004,546 during the same weeks of 1853.

OUR readers are aware that Mr. PUSEY, in whom, more than in any other man, the interests of the Royal Agricultural Society of England are embodied, has been suffering from very severe illness. We are glad to learn from the letter of Dr. ACLAND to the daily papers that he is at length rallying; and we sincerely trust that in due time he may recover from his severe attack, and be able to resume the position he has so long and so usefully occupied in the councils and direction of the Agricultural Society.

REPORT AND ESTIMATE OF A FARM.

I NOW send you a detail of the mode of cultivation which I think would be the most profitable for you to adopt: an estimate of the working cattle and implements required, and of the number of sheep and other stock you will be able to keep.

This farm is on the chalk formation, and the soil is either a thin gravelly loam or chalk with flints. It consists of 260 acres, of which 20 acres are in pasture, 60 in down, and the remaining 180 acres are under the plough. Of these 180 acres I would have always 20 acres in Saintfoin, and of the remaining 160 acres, one-half, or 80 acres, I would have producing grain, and the other half producing Turnips or other roots, and fodder crops, these to alternate yearly with each other.

The Norfolk or four field system, which is almost universally adopted in your district, is to take Wheat after Clover or seeds, then Turnips after the Wheat, Barley with Clover seeds sown amongst the Barley, and after Barley Clover or seeds; this finishes the rotation. From this system it is evident that the several crops come around on the same field every four years. This quick repetition of the same crop on the same ground is the greatest objection to the Norfolk system, as it has been found that the land soon gets tired of Clover and Turnips when repeated on the same ground in so short a period. The Clover very frequently fails, dying in the spring or in the early part of the summer. The Turnip is also a failing crop, producing fingers and toes instead of large bulbs when repeated every four years.

The Scotch, or six field system, puts off the Clover and root crops two years more than the Norfolk system; but then they have only one-sixth part of their land in roots, and one-sixth part in Clover, one-sixth part being in Beans or Peas, and the remaining three-sixths in corn; by this rotation they have one-third only producing fodder crops, and two-thirds producing grain for sale in the market.

By adopting the alternate system of a seed producing and a fodder producing crop, you can have those crops which the land soon gets tired of at as great a period apart as you have crops on your list whose nature and habits are different.

I have for years adopted the eight field system, and have found it to be most productive of large crops of Clover, and all the various kinds of roots, as these never occur on the same field oftener than once in eight years; and the grain crop I adopted was Wheat after all the roots and Clover or other fodder crops; but my land was of a strong clayey loam, and by deep cultivation, and the application of a large quantity of manure to all the root and fodder crops, I had large crops of Wheat every two years.

The succession of crops which I think best adapted for the dry friable land of your farm is the following:—Divide the 180 acres of area into nine fields of 20 acres each; one of the fields, or 20 acres, to be always in Saintfoin; this field to be renewed every five years by laying down another field of Saintfoin, and breaking-up the old Saintfoin field. Then say—

No. 1, to be in Clover	20 acres
No. 2, to be Wheat, after the Clover...	20 "
No. 3, Winter Vetches, Winter Barley, and Rye, for spring fodder, and then planted with Rape for sheep	20 "
No. 4, Oats, after the Vetches, Rye, and Rape ...	20 "
No. 5, Turnips, Swedes, Cabbages, after the Oats ...	20 "
No. 6, Wheat, after the Turnip seeds and Cabbages...	20 "
No. 7, Mangold, Carrots, and Potatoes, after the Wheat	20 "
No. 8, Barley, with Clover, after Mangold, Carrots, and Potatoes	20 "

By this arrangement you will have—

In Wheat two 20 acre fields, Nos. 2 & 6	40 acres
In Oats (No. 4)	20 "
In Barley (No. 8)	20 "
80 acres of seed producing crop	80

And for spring and summer food for sheep—

The Clover field, No. 1, for hay or pasture	20 acres
Vetches and Rye or Winter Barley, No. 3	20 „
The Pasture and Down	80 „
The Saintfoin field for hay or pasture	20 „
	140

And for winter keep for sheep you will have—

Of Turnips and Swedes (No. 5)	20 acres
Mangold, Carrots, and Potatoes (No. 7)	20 „
And the second crop of No. 3, late sown Rape after the Barley, Vetches, &c.	20 „
	60

To cultivate the 180 acres of this dry friable arable land under the alternate system of husbandry, you will require six horses to give you animal power sufficient to do all the work you will require. The expense of your working cattle and implements may stand thus :—

To six working horses, at 25*l.* each			£150 0*s.* 0*d.*	
Implements:—				
„ three ploughs (Howard's) 3*l.* 3*s.* ...	£9 9*s.* 0*d.*			
„ three sets of draft trees	0 15 0			
„ one cultivator	10 10 0			
„ two pairs of heavy iron harrows ...	6 6 0			
„ two pairs of light harrows	5 0 0			
„ two horse hoes	5 10 0			
„ two rollers, at 10*l.* and 4*l.*	14 0 0			
„ a corn drill	20 0 0			
„ five one-horse Scotch carts, at 10*l.* ...	50 0 0			
„ five harvest carts, bodies for the same wheels, at 5*l.*	25 0 0			
„ harness for six horses, at 4*l.*	24 0 0			
„ one wheelbarrow	1 10 0			
„ stable furniture	4 0 0			
			176	0 0
Barn Implements:—				
To winnowing machine	13 0 0			
„ riddles, sieves, rakes, and forks ...	4 0 0			
„ 1 bushel measure, 1 peck, 1 quarter ...	2 0 0			
„ two ladders	2 0 0			
„ 60 sacks	6 0 0			
„ two hay-cloths	16 0 0			
			43	0 0
Implements for Stock:—				
To two Turnip cutters	8 0 0			
„ a chaff-cutter	6 0 0			
„ a cake-bruiser	5 0 0			
„ a Linseed and corn bruiser	6 0 0			
„ 80 dozen of hurdles, at 6*s.*	24 0 0			
„ ten feeding troughs, at 6*s.*	3 0 0			
			52	0 0
			£271	0 0

In estimating the quantity of sheep you will require, it will be necessary to ascertain the quantity of food your fodder crops will produce. For these there will be 20 acres of Clover and 20 acres of Saintfoin; these 40 acres may be made into hay, or part of them may be pastured; either way, there is the aftermath as pasture for the sheep during the summer and autumn. Then there is the 20 acres of pasture, and 60 acres of Clover, as summer and autumn food for the sheep and other stock, and as winter food for your sheep you have 20 acres of Turnips and Swedes, and 20 acres of Mangold, Carrots, and Potatoes; and the second crop, say 20 acres of Rape, after the Vetches, Rye, and Winter Barley. These 60 acres of roots will, with what hay or chaff you have, give you fodder enough for 450 sheep for seven months; and the 60 acres of Clover, 20 acres of pasture, and 20 acres of Vetches, Rye, and Winter Barley will give you food for the sheep during the five summer months, which, together with your 40 acres of hay, and 20 acres of Oat-straw, will enable you to keep your working cattle and three cows, three calves, three year-olds, and three two-year olds. But to the straw for the beasts you will have to add some oilcake, say 5 tons, or Linseed and Bean-meal, and Oats. We may estimate your sheep and beasts at—

Say 225 ewes and lambs, at 32*s.* 6*d.*	£365 12*s.* 6*d.*		
„ 50 ewe lambs for stock, say 25*s.*	62 10 0		
„ 3 rams, at 5*l.*	15 0 0		
	£443 2 6		
To 3 cows in calf, say 15*l.*	£45		
„ 3 year-olds, at 6*l.*	18		
„ three 2-year olds, at 10*l.*	30		
„ two breeding sows	10		
		103	0 0
		£546	2 6
Seed Expenses:—			
Wheat for 40 acres, say 60 bushels at 6*s.*	£18 0*s.* 0*d.*		
Barley for 20 acres, say 40 bushels, at 4*s.*	8 0 0		
Oats for 20 acres, 40 bushels, at 3*s.*	6 0 0		
Clover and Grass seeds for 20 acres, say	15 0 0		
Carrots, Mangold, Swede Carrots, and Potatoes, say for 40 acres, and 20 acres of Rape	8 0 0		
Vetches, Rye, Winter Barley	8 0 0		
Seed	£63 0 0		
To corn for horses, say 2 bushels per horse, weekly 12 bushels, 52 weeks, or 83 quarters of Oats, at say 22*s.*	£91 0 0		
Say manual labour on 180 acres, at 35*s.* per acre ...	315 0 0		
Manure for 80 acres yearly, at 25*s.* per acre ...	100 0 0		

On your entering there will be certain acts of husbandry to pay, but this will be allowed to you on your leaving at the end of your lease.

RECAPITULATION OF CAPITAL REQUIRED.

Working cattle	£150 0*s.* 0*d.*
Implements	271 0 0
Sheep	443 2 6
Cows and other stock, and Pigs	103 0 0
Value of Stock	£967 2 6

The yearly expenses may be stated thus, say—

Seed corn	£ 63 0*s.* 0*d.*	
Horse corn	91 0 0	
5 tons of oilcake, at 10*l.*	50 0 0	
Manual labour, say	315 0 0	
Manure, say	100 0 0	
		£619 0 0
Your tradesmen's bills, say—		
Carpenter, 3*l.* a plough	£9 0*s.* 0*d.*	
Smith, 3*l.* a plough	9 0 0	
Saddler	3 0 0	
Hurdles	8 0 0	
		£29 0 0
		£648 0 0

The probable return from 225 southdown ewes put to Cotswold rams may be 275 lambs, say 50 lambs to be kept for ewes, and—

225 sold at, say 26*s.* each			£292 10*s.* 0*d.*	
50 cast off ewes, say 35*s.*			87 10 0	
Wool, 278 fleeces at 5 lbs., 1390 lbs. at 1*s.*			69 10 0	
			£449 10 0	
The three cows should produce 7*l.* each ...	£21			
Three fat 3-year olds, 23*l.* each	69			
The two sows should produce 20 pigs, 50*s.* each	50			
			£120 0 0	
The return from the stock			569 10 0	
40 acres in Wheat, at 28 bushels per acre, 1120 bushels at 6*s.* per bushel	336 0 0			
20 acres in Barley, at 36 bushels per acre, 720 bushels at 3*s.* 9*d.* per bushel	135 0 0			
20 acres of Oats, at 56 bushels per acre, 1120 bushels at 2*s.* 9*d.* per bushel ...	154 0 0		625 0 0	
			£1194 10 0	

The capital required for the cultivation of your farm, consisting of 260 acres, the yearly expense of cultivation, the interest required to keep this capital of the same value, and the interest on the capital invested : —

		Capital required.	Interest and yearly expense.
To working horses ...	£150 0 0		
„ implements	271 0 0	£421 0 0	
„ 10 per cent. on this sum to keep it always of the same value ...			£42 2 0
„ sheep, cows, and pigs		546 2 6	
„ 7½ per cent. to insure the stock against loss			40 19 0
„ Capital invested		£967 2 6	
„ 10 per cent. interest on this capital invested			96 14 0
„ seed corn, horse corn, manual labour, manure, oil-cake, or Linseed		619 0 0	619 0 0
„ 5 per cent. on this is equal to 10 per cent., as it has not been out for more than half a year ...			30 19 0
„ tradesmen's bills		29 0 0	29 0 0
		£1615 2 6	£858 14 0
„ Rent and parochial rates ...			236 0 0
„ yearly payments and interest ...			£1094 14 0
The return amounting to			1194 10 0
Deduct the yearly payments... ...			1094 14 0
Clear profit			£99 16 0
Which, together with 10 per cent. on the capital invested, 967*l.* 2*s.* 6*d.* ...			96 14 0
And 5 per cent. on the yearly expense of cultivation, being 619*l.*, amounts to			30 19 0
These three items making together the amount of your income.			£227 9 0

—*J. M.*

TITHE COMMUTATION SEPTENNIAL AVERAGES.

[We have received a letter from Mr. Willich explanatory of the gradually decreased value of the Rent-charge from 1849, notwithstanding the gradual increase in the price of Wheat. The following is an extract.]

It was enacted by the 57th clause of the Tithe Commutation Act (6 and 7 Wm. IV. c. 71), that the amount of the rent-charge, as awarded or agreed upon, should be divided into three portions, and that every tithe rent-charge should be deemed to be of the value of such number of imperial bushels, and decimal parts of an imperial bushel, of Wheat, Barley, and Oats, as the same would have purchased at the average prices for seven years ending Thursday before Christmas Day 1835, in case one third part of each rent-charge had been invested in the purchase of Wheat, one third thereof in the purchase of Barley, and the remaining one third part in the purchase of Oats.

In conformity with the above, we find that 100*l.* expended in Wheat, Barley, and Oats, would have purchased the following quantities at the average prices for seven years to Christmas 1835, as fixed in the *London Gazette* of Dec. 9, 1836.

	£ s. d.		Per Imp. Bushel. s. d.		Imp. Bushels.
⅓ or	33 6 8	in Wheat at	7 0¼	is equivalent to	94.955489
⅓ or	33 6 8	in Barley at	3 11½	„	168.421052
⅓ or	33 6 8	in Oats at	2 9	„	242.424242
	£100 0 0				

It is therefore clear that the rent-charge was not a fixed money payment of 100*l.*, but only such a sum as the above quantities of Wheat, Barley, and Oats are equivalent to, according to the average prices for seven years to each preceding Christmas.

The Septennial Averages as published in the *London Gazette* may be shown to be correct by the following statement of the Annual Averages.

	Wheat per Imp. Quarter.	Barley per Imp. Quarter.	Oats per Imp. Quarter.
1848	50*s.* 6*d.*	31*s.* 6*d.*	20*s.* 6*d.*
1849	44 3	27 9	17 6
1850	40 3	23 6	16 5
1851	38 6	24 9	18 7
1852	40 9	28 6	19 1
1853	50 3	36 2	21 0
1854	72 5	36 0	27 11
	7)339 11	7)205 2	7)141 0
	8)48 6	8)29 3	8)20 1
Average per Imp. Bushel	6 0¾	3 7¾	2 6

The year 1847, which in the above account is replaced by the year 1854, was, in consequence of the scarcity which then existed, one of high prices, and particularly so as to Barley and Oats, viz.:

1847—Wheat, 69*s.* 9*d.* Barley, 44*s.* 2*d.* Oats, 28*s.* 8*d.*

On comparing these amounts, which are excluded from the seven years, with those of 1854, which are added, it will be evident that the septennial average must necessarily be less than in the preceding year, although the price of Wheat was a little more in 1854 than in 1847.

We have seen that the 100*l.* rent-charge was from the passing of the Act to be represented by a certain number of bushels of Wheat, Barley, and Oats; therefore, if we value these bushels by the septennial average prices, as fixed in the *London Gazette* of the 5th inst., we shall find the value of 100*l.* of Tithe Rent-charge for the year 1855 as follows:

		s. d.		£ s. d.
94.955489 bush. of	Wheat at	6 0¾	per imp. bush. ...	28 15 8
168.421052 „	Barley at	3 7¾	„	30 14 0¼
242.424242 „	Oats at	2 6	„	30 6 0¼
				£89 15 8¾

—*Charles M. Willich, Actuary, University Life Office.*

SOURCES OF AMMONIA.

[Extracted from a paper by Dr. Anderson in the Transactions of the Highland Society.]

It is sufficiently well known that the manufacture of gas is the source of all the ammonia, with trifling exceptions, now employed in the arts, and consequently the production of that substance is limited by the extent to which gas is consumed. Under these circumstances it might seem at first sight that nothing remains to be done, and that the quantity of ammonia cannot be increased at will. This inference would undoubtedly be correct if all the ammonia produced in the manufacture of gas were worked up and converted into a marketable commodity. But this is very far from being the case. The ammoniacal liquor of the gas-works is commonly looked upon as a refuse, and except in large towns, where the quantity produced is sufficiently large to support a separate work in which the liquor is purified, and converted into sulphate or other salts of ammonia, it is generally allowed to run to waste. What proportion is thus lost it is impossible to say, but it is certainly very large, and is probably increasing. Of late years a great extension has taken place in the manufacture of gas on the small scale, so that every small town, and even village, has its gas-work; and it is in these small works that the greatest waste takes place, for in them it is usually considered, and perhaps, in some instances, with justice, that the working up what may be called the refuse products is not remunerative. In the extremely small gas-works, where the quantity is very trifling, this is no doubt sometimes true; but in moderately small towns it could certainly be carried out with success, if taken up as a regular part of the manufacture of gas. It is somewhat remarkable that the gas companies have shown an extreme indisposition to do this, and, so far as I know, there is only one gas-work in Britain where it is done—in that of Manchester, which in many respects is an admirably conducted establishment. In all other large works the gas liquor is sold, generally at a very low price, to another manufacturer, by whom it is converted into marketable products. The manufactory in which these processes are conducted is generally placed near a large gas-work, and it is customary, when other circumstances are suitable, for the manufacturer to purchase and convey to his work the produce of small gas-works in the neighbourhood. With distant works this cannot be done with profit, and in these cases it generally happens that the liquor is lost. The extent of this loss may be estimated when it is borne in mind that coal contains in general about 1.5 per cent of nitrogen, and though there is always a considerable loss we may fairly assume it to yield 1 per cent. of ammonia—and at this rate every ton of coal would yield nearly 1 cwt. of sulphate of ammonia.

Now, in order to convert the ammonia into sulphate, all that is requisite is to add to it the necessary quantity of sulphuric acid, and to evaporate it until the fluid has reached a sufficient degree of concentration to yield crystals, an operation which is far from troublesome, and does not require any great amount of skill. The question then is, whether this process can be profitably carried on in a gas-work?—and of this there can be very little doubt, when we consider that almost exactly three-fourths of the whole weight of the sulphate of ammonia consists of sulphuric acid. The price of sulphuric acid varies much, but, supposing it to cost the manufacturer 8*l.* per ton, which is greatly above the average, the quantity required to produce a ton of sulphate of ammonia would cost 6*l.*, and the product is at present sold at from 16*l.* to 18*l.* per ton, thus leaving 10*l.* to cover the cost of manufacture, and to leave a price for the ammoniacal liquor. The cost of manufacture will consist of the wear and tear of the evaporating pans, and the coal required for the evaporation; but this latter expense might be in part or entirely saved, by an arrangement for economising the waste heat from the retort furnaces.

It is impossible to arrive at any correct estimate of the amount of ammonia which is at present wasted, but it certainly would not be an over-estimate to fix it at from one-fourth to one-third of all produced. There are many towns of 20,000 or 30,000 inhabitants where the whole is got rid of by running it into the drains; and, even in so large a town as Dublin, it is only within the last two or three years that sulphate of ammonia has been manufactured. Could a third be added to the production, it cannot be doubted that a decided fall in the price would immediately follow.

In the preceding remarks I have referred only to the means of more completely employing that portion of the ammonia which is condensed in the liquor, but a large quantity is also lost by passing off uncondensed in the gas; and though various methods of arresting it have been proposed, these have hitherto been attended with very partial success. Within the last year or two, however, a process has been patented, by which the purification of the gas is effected in a very complete manner, and the ammonia separated is at once obtained in a state in which it can be employed as a manure. I am given to understand that a mixture of sulphate of iron, lime, and sawdust is made, which is introduced into the purifiers of the gas-works, and after having been exposed as long as it continues to purify the gas sufficiently, it is removed, and replaced by another quantity. The product is a dark-coloured, almost black substance, perfectly granular and tolerably dry, and has a strong smell of gas, which at once betrays its source. Several analyses of this substance, made in my laboratory, have shown it to contain from 7 to 8 per

cent. of ammonia; but I have been informed that it can be, and is, obtained with as much as 12 per cent. The rest of its constituents, consisting of sawdust, sulphate of lime, and oxide of iron, are not of value as manurial substances, and the article must therefore be estimated entirely from its ammonia. The importance of this process and its product cannot at present be properly estimated, as the patent has not come into full operation; but it is said that, if generally adopted, it would produce upwards of 100,000 tons per annum of the manure; and assuming it to contain 8 per cent. of ammonia, this would correspond to upwards of 30,000 tons of sulphate of ammonia. When it is remembered that all this ammonia has hitherto been entirely lost, the value of the process appears considerable; and it is most desirable that it should be generally adopted by the gas companies. The product at the present price of sulphate of ammonia is worth from 5*l.* 10*s.* to 6*l.* per ton; and at that price it would undoubtedly meet with purchasers. I am not aware that it has yet been employed in Scotland to any extent as a manure; but if it has, it would be conferring a benefit upon agriculture if the results were made public.

The price of ammonia might be diminished in another way, and though there are no immediate prospects of much being done in the direction in question, it is worth mentioning. It is entirely in the form of sulphate that it is at present employed, and, from what has been already said, it must be obvious that the value of the salt depends on its ammonia alone, and not on its sulphuric acid, which is used only as a means of converting the ammonia into a solid and transportable form. Of every ton of sulphate of ammonia, about three-fourths consists of sulphuric acid, costing from 5*l.* to 6*l.*; and it is manifest that, if this could be dispensed with or replaced by any cheaper substance, the price of ammonia in a transportable form would be proportionally lowered. In fact, what is required is a cheap acid. It does not appear that there is much prospect of this requirement being supplied, but attempts have been made to employ refuse acids, or refuse mixtures containing acid, to neutralise the ammonia of the gas works, and with considerable success. A salt has been lately sold to some extent under the name of muriosulphate of ammonia, which appears to be made in this way. An analysis of this substance, made in my laboratory, has given the following results:—

Sulphate of ammonia	62.55
Muriate of ammonia	1.22
Chloride of potassium	4.75
Chloride of sodium	17.35
Water	14.49
	100.36
Ammonia	16.50

This substance, then, has a value about two-thirds that of pure sulphate of ammonia. It is obvious, however, that the value of such a substance is liable to great variation according to the amount of common salt (chloride of sodium) and water which it contains, and the subjoined analysis will show to what an extent it may vary, not only in the proportion, but even in the nature of its constituents:—

Sulphate of ammonia	43.79
Sulphate of soda	9.19
Sulphate of magnesia	18.38
Chloride of potassium	2.94
Chloride of sodium	0.35
Water	25.39
	100.00
Ammonia	11.28

In this case the value of the substance will be less than half that of sulphate of ammonia.

It still happens, however, that a price remains to be paid for the acid, and hence the question has arisen, Why not employ the ammonia alone? It is unnecessary to refer to the fact that gas liquor has been employed as a manure, and with much success; but its applicability is limited by its bulk, which raises the cost of transport so much that it can only be used in places situated in the immediate vicinity of gas-works; while even supposing it brought upon the farm, it must be largely diluted, and in ordinary cases applied by the watering cart at great expense. The latter objection does not apply to those farms in which pipes are distributed through the fields, as in that case the gas liquor can be easily applied along with other liquid manures. But even with such farms the cost of conveyance is very great, unless they happen to be well situated. In some gas-works, however, the crude ammoniacal liquor is submitted to rectification, and obtained of such a strength as to admit of easy and cheap transport. A sample of this concentrated ammoniacal liquor, analysed in my laboratory, was found to contain 16,490 grains of ammonia per gallon, or upwards of 20 per cent. One ton and a quarter of this fluid will therefore contain as much ammonia as a ton of sulphate of ammonia, and as it is sold at 6*d.* per gallon, the price of the ammonia in this state does not exceed 2½*d* per pound. When sulphate of ammonia costs 14*l.* per ton, the ammonia in it is sold at 6*d.* per pound, and when at 18*l.* at nearly 8*d.*; and it is obvious that the employment of this fluid would be attended with great economy. Unfortunately it happens from the nature of the manufacture of gas, that the greater part of the ammoniacal liquor is produced in winter, at a time when it cannot be applied to the land, and the farmer would be compelled to purchase it in winter, and preserve it until it was required. The volatility of ammonia, when uncombined with an acid, is such, that this strong fluid could not be kept without considerable loss, and there is little prospect of its coming into use; but supposing the farmer to buy not only that substance, but also sulphuric acid, it would be possible for him to mix the two and preserve the mixture in open tanks without loss, or, what would be better still, in closed casks. At this rate he would obtain his ammonia in the state of sulphate, although still in the fluid form, at 5½*d.* per lb., in place of from 6*d.* to 8*d.* It may be questioned, however, whether this saving would at all compensate for the increased trouble and expense of storing the fluid.

While, therefore, I doubt whether much can be done at the present time in this way, I am strongly impressed with the opinion that encouragement should be given to the working up the ammonia of the small gas-works; and as, from what has been already said, it cannot be doubted that a considerable profit is to be derived from it, the farmers of any districts in which small gas-works exist would do well if they were to make an offer to take sulphate of ammonia from them at a definite price. It is certainly nothing but the difficulty of obtaining a local demand, which prevents these gas-works from attempting to dispose of their waste products.

Home Correspondence.

Root-grating Machine.—From the reply to a "Small Farmer" in the *Agricultural Gazette* of the 20th inst., I can give him somewhat more information than that reply furnishes. If he feeds his animals with cut roots alone, there is no better article than Gardner's cutter in general use; but if he is desirous of adopting the far more economical and scientific practice of making his animals eat roots and more solid food mixed together, he will require a different machine. Carson's, of Warminster, is a very effective article for cutting Swedes, &c., into thin ribands, which mix intimately with chaff. I have had one (price 4*l.* 10*s.* cash) in use for four years, which has cut for a large stock of bullocks their entire supply during that period. The first pulping machine was produced at Lincoln by Phillips, which I see advertised in the same *Gazette*. This appeared to do its work perfectly, but the cost (11*l.*) was too high for the purpose. I was informed at the Smithfield Show the cost had been reduced 4*l.*, or thereabouts. There was another machine exhibited there which appeared quite as efficient for all practical purposes, though it worked in a different way, the cost of which was 6*l.* 6*s.* I have unfortunately mislaid the manufacturer's description of the machine and his address. Not having had actual experience of the two latter machines, I can only say they appeared to accomplish the perfect comminution of the root for feeding purposes. *C. L.*

Employers and Employed.—From time immemorial there have been classes in society, some rich, others poor—one to command, another to obey; learned and ignorant—master and servant. The separation now existing between men and women placed in the various positions of life was not always so great. By going back fifty or sixty years, it will be found the mass of agricultural labourers were better cared for; boys grew to men on the same estate—son succeeded to father; the peasants remained bound to the same locality by peculiar feelings; they seldom thought of migrating, looking upon the family estate of their master and mistress, at least the labour of it, as belonging of right to them. The attachment was that of the better part of the feudal system without its imperfections, the owner of property being considered as a father as well as ruler, showing kindness and consideration to all those in his service. The interest of master and man was closely woven together—they might be said truly to rely on each other for assistance in time of need. The selfish principle of accumulating money by every means, without reference to the comforts and welfare of those by whose aid it is gathered together, has, in a great measure, severed the bond of union so much to be desired between employer and employed, both in large and small concerns. There is one splendid example to the contrary in Price's Candle Manufactory, where a system of education was commenced and carried out, single-handed, by a clerk or manager to the establishment, and afterwards supported, and still continues to be so, by the company. Now, if one influential house can organise and maintain schools, libraries, and a church, surely other firms equally wealthy can follow so brilliant an example of charity in its full meaning. Landholders, merchants, manufacturers, shopkeepers, and householders of every description will find that kindness and attention to the temporal and spiritual wants of their dependants are never thrown away, but remembered with gratitude—shown by real interest taken in everything that belongs to their masters and mistresses. In all relations of life the higher views as accountable beings should be the guiding principle of action. All mankind belong to the same great family. It is education and superintendance in youth that marks the difference in manners, tastes, opinions, and amusements. With regard to morality, the upper orders are more refined in their profligacy, according to the notions of the world, but not less guilty than the lower classes, who carry on their drunken orgies in beer-houses and the gin palace. In proof of the high cast of character lying dormant in the peasantry and artisans of the United Kingdom, it is only necessary to refer to their conduct during the campaign in the Crimea. They who have shown such daring and chivalric courage under the hottest fire, who have evinced such patience and constancy under unheard-of sufferings from disease and starvation, cannot be composed of senseless clay, or unworthy to be numbered amongst the noblest works of God. The reflections of those who have so terribly neglected to provide for the common wants of our gallant and enduring soldiers are not to be envied. Thousands have been sacrificed to blundering incapacity, or something worse. It must be recollected that the heroes of Alma, Inkermann, and Balaklava, were drawn from the toilers in our fields and manufactories, whose sinews and intelligence are used (too often abused) without a corresponding return, in providing useful instruction, and giving them time to take advantage of it. It is enough to make a nation weep tears of blood to witness the destruction of the finest expedition that ever left the shores of England, not from the bullets and swords of the enemy, but from neglect of the commonest precautions. Was such a thing ever heard of before as an army allowing itself to be cut off from supplies of food, firing, ammunition, clothing, medical comforts, tents, &c., lying within seven miles of the camp, from the want of a road in a country where stone is plentiful, the natives ready to work, and where it ought to have been known the country was impassable in winter, without some exertion being made to keep up a communication with the transports? A dark page in the Anglo-Saxon history. *Falcon.*

Payne's Defiance.—Mr. Mechi, in your paper of the 6th, in asking for information respecting the price of Payne's Revitt Wheat, says it is "10*s.* below other red Wheat." Generally speaking I think Payne's Revitts are about 2*s.* 6*d.* per quarter cheaper than other red Wheat of the same weight. This year is an exception, on account of the large breadth and the blight, which seems to have affected this sort of Wheat more than any other; but even this year I don't think the difference is more than 4*s.* or 5*s.* per quarter. Mr. Mechi weighed 62 lb. (mind ye) to the bushel. Perhaps Mr. Mechi's neighbours don't know the value of this Wheat. I know a miller who lately ground a moiety of this Wheat for a whole year, and he made quite as good flour as his neighbouring millers. Referring to the blight, I know to my cost that it is true. I had about 4 acres of Payne's Revitts on the Lois-Weedon system; it looked well till nearly harvest, then the blight took it; perhaps its being thin on the ground is some of the cause. The grains of Wheat were wonderfully thin, so that I had only 2 quarters per acre. I have no hesitation in saying that if the grains of Wheat had been four times as large, instead of two, I should have had 8 quarters per acre. This information (such as it is) is from *J. P. P., Colne Engaine, Essex.*

Societies.

Society of Arts, *Jan. 24.—On the Uses of Peat and other Charcoals.*—Mr. Longmaid read a paper on this subject, in which he referred principally to the use of charcoal as fuel, and the value of such fuel, especially in the iron manufacture. He also alluded to Dr. Stenhouse's experiments with charcoal as a disinfectant, and remarking that it was possible to renew charcoal that had been so used and reconfer its disinfecting powers, he said that this need not be practised, seeing that it then becomes useful as a manure:

"Professor Liebig states that peat and spent bark are most difficult forms of organic matter to deal with as manure; that peaty matter remains for years exposed to the influence of air and water without undergoing change, and in this state yields little or no nutriment to plants. Recent experience has, however, shown that when organic matters, such as peat and spent tan, are converted into charcoal, they become exceedingly valuable as vehicles for the transmission of water, nitrogenous compounds, carbonic acid, &c., to the plants, first separating these matters from the atmosphere, and again yielding them up when required. The mode of applying charcoal as manure is simple; it should be ground to a coarse powder, and then strewn over farmyards, manure heaps, stables, cow-houses, pig-styes, cesspools, or placed in manure tanks, urinals, &c. It is suitable for being applied, also, without mixture by the drill or broadcast, in the proportion of 4 to 7 cwt. per acre, to all green and corn crops, and will be found a valuable addition to most soils, especially clayey ones.

In the discussion which followed the reading of Mr. Longmaid's paper, the uses of charcoal as a filter for disinfecting sewage manure were referred to. Mr. W. F. Cooke spoke of the immense quantity of useless and mischievous wood in hedgerows and woodland, which, could it be easily converted into charcoal, would be useful agriculturally. Mr. Scott alluded to his experience of charcoal as a dressing for Potatoes.

"During the years 1846-7-8, when the disease of that root was most prevalent throughout the United Kingdom, his crop of Potatoes in Cheshire, which had been dressed with charcoal, was comparatively free from disease. Charcoal was well known to be most useful as a deodoriser. He had used it in his stables, and it was known that nothing was more injurious to a horse than the smell of his own house, but the charcoal had the effect of rendering the stables sweet and wholesome, and after it had performed that office it was available for manure. With regard to the advantages of converting wood into charcoal, they were at present extremely problematical. The peat bog for fuel was worth, perhaps, from 6*l.* to 8*l.* per acre, whilst the land was prepared for reclamation, but when converted into charcoal, it had never yet, he believed, been found to pay, and therefore it was hardly fair to characterise this as one of the unappreciated and undeveloped resources of Ireland."

Notices of Books.

Land Drainage and Drainage Systems. By J. Bailey Denton, F.G.S., Assoc. Inst. C.E. J. Ridgway, 169, Piccadilly.

This pamphlet, which deserves a much fuller review than we can this week give it, contains the paper read by Mr. Denton before the London Farmers' Club. We have already alluded to that paper; it is considerably enlarged, and illustrated by numerous engravings in its present form. We have no hesitation in characterising

it as one of the best, fullest, and most practical essays on its subject. This character of it we shall hope to justify in a future number; our object now is just to intimate the fact of its publication in such terms as may promote its circulation and perusal.

Calendar of Operations.

JANUARY.

Berwickshire Merse Farm, *Jan.* 22.—The weather of December was characterised by frequent changes of short duration. Two or three days of hard frost were suddenly followed by a drizzling fresh; a few days of fine weather and frost again in rotation. In those fresh intervals, the previous dry state of the soil admitted of Wheat sowing after Turnips, to some extent; but such operations were often cut short by the inconstancy of the elements. A hurricane, more violent than any within the memory of the "oldest inhabitant," ushered in the new year, stripping roofs, levelling trees, and blowing away stacks in exposed situations. On some farms the loss of grain completely carried away is very serious, besides the mixing of various kinds together. The ensuing fortnight was quite like spring, mild, moist, growing weather. The land being in first-rate order, a considerable breadth of Wheat was sown, after Turnips eaten on with folded sheep. The young Wheat plant has made great (we hope not too great) progress during the late fine weather. Turnips will generally be sufficient to carry on feeding stock, with the assistance of corn, cake, &c. Live stock have done very well in this mild season. Stackyards have not been spared, though the winter has been too dry for "putting down" straw; and it seems that more than one half of the crop has passed into the market, in the case of Wheat at least, for immediate consumption. For a week past we have had constant showers of soft snow, partially lying, and a gentle breeze from south-east. This will wash nicely in the guano lately sown on seeds intended for soiling and hay. *J. T.*

Cheshire: *Jan.* 18.—The months of December and January generally are the least interesting of the whole year to the Cheshire farmer, as the business of the farm is usually confined to fallowing the Wheat stubbles, carting out manure, and providing straw for the cattle. This winter the weather has been so mild and dry that field operations of varied character, such as pulling and storing Turnips, sowing Wheat on the cleared land, and preparing for spring and green crops, have scarcely been interrupted, and perhaps the only thing clay land farmers have had to complain of has been the want of frost to enable them to cart out their manure to the pasture land, or for their green crops, and this cause of complaint is likely to be removed by the severe frost of the two last nights. Wheat generally is looking remarkably well, and at present, so far as our observations go, there is very little "winter proud" as it is called; this, we think, may be attributed in some measure to farmers sowing their Wheat at a later period than formerly, excepting on the very coldest clay soils, and on these it is not safe to defer it beyond the end of September or beginning of October. Turnips are keeping better than was expected, after so severe an attack of mildew; and the system of cutting and mixing them with chaff or cut straw, for the entire stock, is growing into favour. The best machine we have seen for this purpose is Moody's patent improved. On our farm Turnips are prepared by the above machine twice a day for 100 head of cattle, horses, and colts, and they are looking much better than usual under this treatment; the pleuro-pneumonia, we are sorry to observe, still lingers in some parts of the county, and it is greatly to be feared that many dairy farmers are suffering severely from its ravages. Sheep appear to have done well so far through the fine open winter, which has caused a little springing of fresh Grass on the best land; and young cattle, too, have been able to pick up a little Grass in the meadows, where they have been allowed to range to a much later period than usual. Irrigated meadows, excepting where they are favoured with a constant but an abundant stream of water, are not in the forward state we have seen them at this season of the year, in consequence of the small quantity of rain we have had, which has failed to replenish the reservoirs that were nearly dried up during the last summer. Labourers generally have been plentiful up to the present time, but as the militia regiments are now being embodied throughout the kingdom, there will in all probability be a scarcity, as the demand for them increases during the spring months. Store and other cattle fetch high prices in the market, and store pigs, which a short time ago were a complete drug, have materially risen in value. *W. P.*

Notices to Correspondents.

Gorse Crushers: *W D F.*, in his article upon Gorse as food for cattle last week, wrote "Ransome and Parsons, Salford," as the makers of the chaff-cutter he recommended, instead of "Richmond and Chandler, Salford," who are the makers of the machine he uses. They have now a machine purposely for Gorse, which can be geared so as to cut an eighth of an inch. If it does this effectually one cutting of the Gorse would answer, and save much trouble and expense.

Guano, &c.: *Waterford.* 40 lbs. of vitriol per cwt. of bones will to a great extent reduce them. 2 cwt. of guano, and 2 cwt. of bone-dust so treated would, well mixed with a cart load of mould, and then spread out of the cart with a shovel, make a good dressing per acre of Grass land. Apply it late in February.

Hedges: *A D.* Try Hornbeam, if you *cannot* get Thorn to grow in the gaps that need to be filled.

Italian Rye-grass, &c.: *R Heath.* It usually forms a part now of most mixtures for permanent Grass; being useful at any rate during the earlier years. 8 lbs. or 10 lbs. may be sown in the quantity of mixed seeds, which generally on the whole extends to 40 or 50 lbs. per acre.

Knowledge of Agriculture: *R E H.* You cannot get a "sound knowledge of practical and profitable farming" by books. You may study such books as the "Cyclopædia of Agriculture," Stephens's "Book of the Farm," Low's "Practical Agriculture," and then go and live upon a farm for a year, and in that way you will obtain what you are in search of.

Lime and Salt: *R Heath.* We would get the leaves into a half-rotten state by making a compost with earth before applying the lime. The latter will be much more useful and efficient then. It is most efficient in any circumstances when applied, not in lumps, but artificially slaked. Salt does not act upon fresh lime, or rather is not acted on by it. If mixed with fresh slaked lime, it should lie with it for a month or two before use. The lime becomes carbonate; and carbonate of lime and muriate of soda will react on one another, producing muriate of lime and carbonate of soda, which latter mixture is more caustic and alkaline than the former, and so better fitted to produce those effects in the soil for which lime is applied.

Poultry: *An Old Subscriber and P P.* "Fowls," by Bailey, and "Profitable Poultry," by Tegetmeier, are both good books. The former is probably more what you desire.

Roofing: *A Northern Subscriber* asks for some plan to supersede the present system of roofing with wood and tiles or slates for farm buildings? After high winds they have slates blown off; or the timber (often cut on the property) settles, or shrinks, or rots (dry). Is there any sort of brick arch with bricks shaped so as to act as roof and tiles—if not too expensive? [It *would* be too expensive.]

Mall Farm: *H G.* The report in another column may help you. We hope, however, to give an estimate more nearly applying to your circumstances.

Superphosphate of Lime: *Cheshire.* 3 cwt. per acre is ordinarily a good dressing for Grass land.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" Pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to Waterer and Godfrey, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their Patrons and the Public that their NEW CATALOGUE OF SEEDS for 1855 is now ready, and will be forwarded post free on application.

E. G. H. & Son take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list; and among the Flower Seeds only those whose beauty and merit are universally acknowledged, together with a carefully selected stock of the principal new varieties.

E. G. H. & Son beg respectfully to call particular attention to the following choice seeds of Florists' Flowers, which have been saved from a fine collection of named plants, and also to the annexed New and Choice Flowers, which they can confidently recommend, and in their Catalogue will be found the names of 20 beautiful ornamental Grasses. Also 12 variegated and ornamental foliage plants, for decorating the flower garden during the summer months, with full descriptions and other information respecting the following

CHOICE FLORIST FLOWERS.

	Per packet—*s.*	*d.*
Antirrhinum, extra fine mixed	0	6
Auricula, fine mixed ...	1	6
Balsam, double Camellia flowered, in packets of 6 distinct colours separate	3	0
" double Rose flowered in packets of 6 distinct colours separate ...	3	0
" new double Camellia Rose, in packets of 10 distinct colours separate, extra fine ...	5	0
" Aurora, fine dbl. cr.	1	0
" new dbl. pale yellow	1	0
Carnation, from stage flowers...	1	6
Calceolaria, from choice hybridized flowers 2*s.* 6*d.* and	5	0
Cineraria, from choicest varieties ... 1*s.* 6*d.* and	2	6
Chrysanthemum, Pompone, fine mixed	1	0
" large flowered, fine mixed	1	0
Geranium, choice show ...	2	6
" choice fancy ...	2	6
Hollyhock, first quality ...	2	6
" second quality	1	0
" in 12 distinct colours, each colour ...	0	6
Pansy, choice show, from named flowers ...	1	6
" choice fancy, from beautiful striped and spotted flowers ...	1	6
Petunia, from extra fine named varieties ...	1	0
" saved from crimson flowers with green edges	1	0
Verbena, choice mixed ...	1	0
Mimulus, beautifully blotched	0	6

NEW AND OTHER CHOICE FLOWERS.

	Per packet—*s.*	*d.*
Abronia umbellata ...	1	6
Anagallis azurea grandiflora	1	0
" rubra	1	0
Arctotis breviscapa ...	0	6
Aster, new Peony pyramid, in packets of 10 distinct colours separate	3	6
" new bouquet pyramidal, in packets of 12 distinct colours separate	3	6
Alonso Warscewiczii ...	5	0
Clintonia pulchella ...	0	6
Coreopsis coronata ...	0	6

Holcus Saccharatus (New Sugar Cane). 1*s.* and 2*s.* 6*d.*
Dioscorea Batatas (Japanese Yam), 2*s.* 6*d.* each tuber.
January 27.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS, &c., which they will forward to any part of the United Kingdom or the Continent:—

	s.	*d.*
Andromeda floribunda, fine, per dozen ... ... 12*s.* to	18	0
25 Azaleas, new hardy Belgian varieties, one of a sort on their own roots	20	0
25 Azaleas, American varieties, do. do.	16	0
Hardy Heaths, Ledums, and Kalmias, per dozen	6	0
25 Hardy American Plants, one of a sort	10	6
12 Rhododendrons, including Scarlet, White and Rose hardy varieties	12	0
Fine hardy Scarlet Rhododendrons, 2 feet, per dozen ...	12	0
New hardy Yellow Rhododendrons, each ... 3*s.* 6*d.* to	5	6
6 Fine hardy Magnolias, one of a sort	10	0
50 Dwarf Roses, two of a sort, on their own roots	16	0
Standard and half standard Roses, per dozen ... 12*s.* to	15	0
Fine climbing Roses, of sorts, per dozen	6	0
Greenhouse Azaleas, choice varieties, per dozen	18	0
12 Camellias, well set with buds, fine sorts	30	0
Orchidea Plants, fine species, per dozen	40	0
24 Choice Ericas, one of a sort	16	0
6 Bulbs Lilium Lancifolium, one of a sort	12	0

FRUIT TREES.

Fine standard and dwarf-trained Peaches, Nectarines, Apricots, Plums, Pears, and Cherries. The best and most approved sorts of these respective kinds, to name, each, 3*s.*, or, per dozen	30	0
Untrained or maiden do., 1*s.* 6*d.* each, or, per dozen ...	15	0
Apples, dwarfs and standards of best sorts, per dozen, 10*s.* to	15	0
Fine Gooseberries, Currants, and Raspberries, per dozen	3	0
Figs, Medlars, Quinces, Walnuts, and Mulberries, each ...	2	0
Filberts, new thin shelled and red skinned, per dozen ...	3	0
Strong Vines, from eyes and layers, in pots, per dozen ...	18	0

Large stock of Transplanted fine Scotch Larch and Spruce Firs, cheap.

New Gardens and Greenhouses furnished on moderate terms.

New Priced Catalogue of Plants and Seed List for 1855 by post.

Albion Nursery, Stoke Newington, London.—Jan. 27.

TO THE SEED TRADE AND OTHERS.

THE SUBSCRIBER offers the following SEEDS, which have been grown and selected from the best stocks possible. Prices forwarded on application.

BROCCOLI.
Early White
Miller's Dwarf
Brimstone
Chappell's Cream
Imperial White
Dwarf Danish
Dilcock's Bride

CURLED PARSLEY.

PEAS.
Victoria Marrow
Fairbeard's Nonpareil
British Queen
(Very fine samples.)
Lord Raglan

TURNIP.
Laing's Swede (very true)
Red Tankard
Early Stone
Red American Stone
American Strap or Lettuce-leaved Stone.
White Globe
Green Globe

WURZEL.
Long Red
Yellow Globe

CELERY.
Cole's Crystal White
Cole's Red

EPPS, Seed Grower and Merchant, Maidstone.

LYNCH'S STAR OF THE WEST CUCUMBER.—This might with propriety be called the Champion of the West, for it has won 11 prizes at different Horticultural Exhibitions. It is a seedling raised by Mr. Lynch, the well-known Gardener to the Right Hon. the Earl of St. Germans, Lord Lieutenant of Ireland. He has grown it for several years, and has beaten everything that has been put in competition with it, including all the newest and most recently introduced varieties. We have purchased the whole stock, having given a very large sum for all the seeds in his possession, and it is now for the first time sent out; to those who want a good flavoured, prolific, and prize Cucumber, we would recommend to obtain a packet of the seeds.

It is a first-rate winter fruit, and, with careful management, can be had in perfection all the year round. It is most prolific, and bears two-fruit on every joint, and as many as 42 have been counted on a single plant in a tub from 5 to 22 inches in length. The fruit is quite round, like the barrel of a gun, and free from any ribs or roughness on the skin. It has a short handle, and is in every way calculated to beat any other sort in cultivation. The spines are white, and they stand out in the most prominent way. The stock is very limited.

Three seeds, per packet, 1*s.* 6*d.* | Five seeds, per packet, 2*s.* 6*d.*

The following is an official account of the number of Prizes won by Mr. Lynch, in competition with all the best Gardeners and the best varieties in the neighbourhood:—

"Royal Devon and Cornwall Horticultural Society, Nov. 11, 1854.

"Dear Sir,—The prizes awarded you for your Cucumber are as follows:—

1851.—May 15th, First Prize	1852.—Sept. 9th, First Prize
" July 17th, Extra Prize	1853.—June 8th, Second Prize
" Sept. 4th, First Prize	" Sept. 8th, First Prize
1852.—May 27th, First Prize	1854.—June 1st, First Prize
" July 22d, First Prize	" Sept. 9th, First Prize

In all, 10 Prizes.

"I remain, dear sir, yours truly,
"Nathaniel J. Easton, Hon. Sec.

"Mr. R. Lynch, Gardener to Earl of St. Germans, Port Elliott."

WM. E. RENDLE AND CO., Seed Merchants, Plymouth.

HOLCUS SACCHARATUS,
OR CHINESE SUGAR CANE.
(See Gardeners' Chronicle, Dec. 30th, 1854.)

MR. JOHN HENDERSON, formerly of the firm of John A. Henderson & Co., Pine Apple Place, London, has the honour to announce that he is prepared to supply Gentlemen, Amateurs, and Professionals, with seed of this most valuable and estimable plant.

As the Dioscorea Batatas seems well adapted to make good any deficiency arising from failure in the Potato crops, so this appears admirably calculated to meet many wants of the present day. That it may be used for the purposes of distillation, and may therefore preserve the grain of the country, is not less certain than that the leaf and stem (after the saccharine matter has been extracted) contain a large amount of fibre, of such a nature as can be employed in the manufacture of every kind of paper. In both these points, as well as in many others, this plant demands the attention of every Gardener and Amateur throughout the country; the more so as from the necessity that at present exists for the production of fibres that may be used in paper manufacture a due remuneration may be fairly expected by growers, even after the plant has, so to speak, paid itself by the saccharine matter extracted from it.

Mr. Henderson hopes, in a few days, to have ready for the press a more lengthened account of this plant, as well as a complete statement of the latest experiments in connection with the Dioscorea Batatas. As there are many varieties of the Holcus W. J. H. can only be responsible for seed forwarded by himself, which he is prepared to do in sealed packets, at 1*s.*, 2*s.* 6*d.*, 5*s.*, and 10*s.*, according to quantity.

Orders to be accompanied with a remittance to Mr. John Henderson, Kingskerswell, Newton Abbot, South Devon.

P.S. Price to the Trade can be had on application.

SNOW'S SUPERB BROCCOLI.—Every seed new and true. Sealed packet, 1s.; per oz., 3s.; pound bags for the trade on liberal terms.

GLENNY'S IMPROVED BALSAM.—Unequalled for size, doubleness, and colour; 6 classes, 3s.; mixed, 1s.; sealed packets with culture.

DOUBLE HOLLYHOCKS from noble flowers. Sealed packet, 1s.

Stamps or P.O. orders to GEORGE GLENNY, Horticultural agent, Dungannon House, Fulham. Sales, valuations, &c., attended; Ground Laid Out, Rockwork, Ornamental Water, &c., planned and executed.

BANKS' NEW SEEDLING FUCHSIAS FOR 1855.

W. J. EPPS begs to state that he has purchased the following Seedling Fuchsias, raised by that celebrated grower, E. BANKS, Esq., of Sholden Lodge, Deal; they were the first selection from his splendid batch of Seedlings of 1854, and have been thoroughly proved. They are distinct, rich, and the greatest advance upon any of the kinds known, and cannot fail to give the highest satisfaction.

CLIMAX.—(named by Mr. BANKS).—Tube stout, sepals very broad reflex, with a pretty curve or half circle, the points of the petals touching the seed vessel; colour, rich velvety crimson—the corolla is very large, of a splendid violet blue and great substance; habit, robust, and blooms particularly free. 7s. 6d.

FAIRY QUEEN.—Very distinct and striking, immense bloomer, beautiful waxy white tube and sepals, tinged with lemon, long well-proportioned flower; corolla large, and of a very rich plum colour puce. 7s. 6d.

GRAND SULTAN.—A very noble flower, and will be many years before it is equalled; beautiful foliage, and first-rate for exhibiting; flowers large, very stout, sepals reflex, similar to the Turn Cap Lily, and of a very rich crimson colour; corolla large, and very dark velvety purple. 7s. 6d.

MAID OF KENT.—This Fuchsia is pronounced by the following judges, viz., Mr. Edwards, Secretary to the Floricultural Society; Mr. Barnes, of Camden Nursery; Mr. Todd, of Sutton, to be the prettiest and most distinct Fuchsia yet raised; habit, dense and bushy, producing great clusters of pretty reflexed blooms, of great substance, very clear waxy white, with a rich plum-coloured puce corolla, and exceedingly striking. 10s. 6d.

BEAUTY OF THE BOWER.—A very rich and perfect formed flower, scarlet tube and sepals, which reflex over the tube, displaying a beautiful dark purple corolla of great substance: habit, perfect. 7s. 6d.

OMER PACHA.—A large and well-proportioned flower, with dark crimson tube and sepals: corolla, intensely dark velvety purple: habit, excellent and very graceful. 7s. 6d.

The Set will be sent out in April.—Strong Plants, at 42s.

The usual discount to the Trade where three of each are taken.

Agent—HENRY and M'MULLEN, Seed Merchants, Leadenhall Street, London.—Bower Nurseries, Maidstone.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out plants in April next of their NEW SEEDLING FUCHSIAS WITH WHITE COROLLAS, BOTH DOUBLE AND SINGLE, also TWO STRIPED OR VARIEGATED COROLLA'D FUCHSIAS, and TWO UNIQUE FUCHSIAS with VIOLET AND BLUE COROLLAS. The last two were purchased of E. Banks, Esq., after having been flowered, the second season, and proved as flowers possessing unquestionable merits, and unequalled by other red varieties previously sent out. All the other varieties were purchased of W. Story, Esq., of Newton, in the county of Devon, who succeeded in introducing a Scarlet Fuchsia with White Corolla, which new feature in this tribe gives one of the greatest novelties that they have had the pleasure of seeing for many years. Mr. Story, being the raiser of this new Class, offered them to Messrs. Henderson for ONE HUNDRED GUINEAS, which offer they accepted. A faithful drawing of three of the varieties here offered has been taken by Mr. James Andrews, the well-known floricultural and horticultural artist, sketches from which have appeared in Van Houtte's "Flore des Serres," Verschaffelt's "Illustration Horticole," and will also appear in Turner's "Florist," for February. The dwarf, compact, and free flowering habits of the plants will be sure to please every grower of this tribe.

QUEEN VICTORIA (Story's).—Splendid wide sepals, beautifully reflexed, of a bright scarlet crimson, and a lovely clear white corolla. Price 10s. 6d.

PRINCE ALBERT (Banks's).—Scarlet crimson sepals reflexed, and rich violet corolla. This flower we consider unequalled by any, its reflexing properties being such that either more or less would be a fault; indeed the flower is perfection itself. 10s. 6d.

MRS. STORY (Story's).—Fine large scarlet tube, long wide sepals reflexed; corolla fine substance, and clear white. 10s. 6d.

RANUNCULÆFLORA (Story's).—Scarlet sepals and tube, with double white corolla, a flower not having that confused appearance as many of the double varieties are known to possess. This was considered the best of the only two double white varieties flowered by Mr. Story. 21s. The other double variety we do not appear to have received.

PERUGINO (Story's).—Fine large scarlet sepals and tube, with a conspicuous striped corolla of rose and purple flakes, handsomely reflexed and free flowering. 10s. 6d.

EMPRESS EUGENIE (Story's).—Wide reflexed petals of a rosy crimson, the inside of petals having a violet shading; corolla fine white. 10s. 6d.

RAFFAELLE (Story's).—A beautiful variegated corolla with crimson sepals well reflexed, and of good substance; the colour of the corolla is a rich chocolate flaked with rose, free flowering. 10s. 6d.

LADY OF THE LAKE (Story's).—Fine deep crimson, with a blush white corolla, very pretty. 10s. 6d.

WATER NYMPH (Story's).—Bright scarlet crimson globe stout, wide petal, corolla fine clear white; an elegant flower. 10s. 6d.

Or if the set of nine be taken, the price, 4l. 4s. A coloured plate of three of the above Fuchsias and one of Cyclamen Atkinsi will be forwarded by post, on receipt of six postage stamps.—January 27.

FUCHSIA (Banks's Favourite).—Fine handsome scarlet sepals and tube; large and conspicuous flowers, with sepals finely reflexed; and a splendid blue-violet corolla of great substance. The stock plant being small the number of plants will be limited. Price 10s. 6d.

MESSRS. E. G. HENDERSON AND SON were surprised to see an advertisement a few weeks back in the *Gardeners' Chronicle*, from Messrs. Lucombe, Pince, and Co., of Exeter, offering two new Fuchsias, similar in character to those described above, and after a written communication with Mr. Story, it was thought necessary for one of the Firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received SEVEN POUNDS for them after (as the said jobbing gardener stated) he had been offered 20*l.* for them by a Nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son think the above explanations necessary, in consequence of a great number of their customers having criticed them at higher prices than are quoted above. This reduction is made in consequence of information which they have received, that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co., are similar in character to the above.—Wellington Nursery, St. John's Wood.

DIOSCOREA BATATAS—THE NEW CHINESE POTATO.—This new esculent was fully described by Professor Lindley in the *Chronicle* of December 23, 1854.

The Subscribers are now importing a choice lot of Roots, and can supply them on the following terms:—

Four Tubers	£0 10 0	Fifty Tubers	£5 5 0
Ten „	1 2 6	Hundred „	10 0 0

First Orders will have the best Roots.—Apply to WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

CHOICE CALCEOLARIAS.

J. COLE begs to offer a few dozen of his unblooned Seedling HERBACEOUS CALCEOLARIAS from his choice stock; they were the admiration of all who saw them last summer. They are not potted off, though strong enough for large 60-sized pots. The Seed was saved from selected stock, carefully impregnated. J. C. offers them at 4s. per dozen, or 25s. per hundred. A remittance solicited from unknown correspondents.—Keyfield Nursery, St. Alban's, Herts.

UNEQUALLED NEW MELON,
GOLDEN DROP GREEN FLESH.

EDWARD TILEY having purchased the whole of Messrs. Wood & Son's stock of Seeds of the above-named Melon, can with confidence recommend it to all growers of that splendid fruit. It has been thoroughly proved by an eminent Melon grower, and declared by all who have seen and tasted it to be one of the finest-flavoured Melons yet grown. It is a very beautiful colour when ripe, skin very thin, flesh firm and solid, and of a most superior melting and delicious flavour. Free setter and prolific bearer. It possesses a great advantage over others in its exceedingly handsome appearance when placed upon a table or on the stall of a fruit salesmen, and for exhibition this Melon will be the favourite.

THE KING, Superb Scarlet Flesh Melon.—This is a variety very much wanted, and which has for some time past been neglected, but is now becoming in great request; such being the case, EDWARD TILEY has just procured a stock of this most superb Hybrid Scarlet Flesh Melon, which he can recommend with as great confidence as those before sent out by him, and which have all given the greatest satisfaction to the public.

Each of the above varieties may be had in packets containing six seeds, 1s. 6d. per packet.

The following fine varieties of Melons can be highly recommended, and are all warranted true:—

The Queen	1s.	Beechwood	1s.
Bromham Hall	1s.	Windsor Prize	1s.
Incomparable	1s.	Emperor	1s.
Golden Ball...	1s.	Fleming's Hybrid Persian	1s.
Golden Perfection... ...	1s.	Blackall's Green Flesh ...	1s.
Rowood	1s.	Bailey's ditto ...	1s.
Victory of Bath	1s.	Snow's Hybrid	1s.
Cameron Court	1s.	Gordon Castle	1s.
Chichester Prize	1s.		

A packet of the Golden Drop and one of the King Melon, and one packet of any other variety mentioned will be forwarded, post free, on receipt of 3s. 6d. in cash or penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman and Florist, 14, Abbey Church Yard, Bath, Somerset.

LIQUID AMBER.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price, and height, to Mr. JEYES, Nurseries, Northampton.

TENTS, MARQUEES, AND RICK CLOTHS.—Now on Sale, several second-hand Rick Cloths, Marquees, and Tents, of various sizes. Some of the Marquees are well adapted for Horticultural Societies. One 50 feet by 30, price 35*l.*; one 70 feet by 30, 50*l.*; and one 100 feet by 30, 65*l.* These are almost new, and quite ready for use. Small tents for the Wars or Emigrants, weighing 12 lbs., price 25s. each, new and waterproof. Small Tents for Gardens, 30*l.* each.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

BLOSSOM OF FRUIT TREES.—WORSTED NET to effectually protect the blossom of wall fruit trees from frost and blight, and the ripe fruit afterwards from wasps and flies, 7*d.* per square yard, in various widths. All kinds of garden, fishing, and sheep nets, made by machinery, and at very low prices.—R. RICHARDSON, 21, Tonbridge Place, New Road, King's Cross, London.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

WOOLLEN NET FOR THE PROTECTION OF WALL FRUIT TREES FROM FROST, 2 and 3 yards wide, can be had of WEATHERHEAD, WALTERS, & Co., Derby. See *Gardeners' Chronicle* of Oct. 28, 1854.

HALL'S GARDEN NETTINGS; the best and cheapest for all purposes of shelter and shade from Frost, Hail Storms, and Gales of Wind. No. 0, 5*d.*; No. 1, 5½*d.*; No. 2, 6*d.*; Nos. 3 and 4, 7*d.* All 56 inches wide, and in lengths of 10, 20, 30, and 60 yards.—Manchester.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.

GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised.
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard
30 in. „ 2 in. „	9*d.* „	6½*d.* „
36 in. „ 2 in. „	10½*d.* „	7½*d.* „
48 in. „ 2 in. „	1s. 2*d.* „	10*d.* „

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1s. 6*d.* and 2s. 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. FOX, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—MAW & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

CHEAP FUEL.

GAS COKE, as used in the Royal Conservatories, admirably adapted for Furnaces (as producing no smoke), and also well suited for Household Fires, to be had at 9s. per Chaldron in quantities of not less than 20 Chaldrons, cleared by barge or carts within a week, from the PHŒNIX GAS WORKS, Bankside, Southwark, or at the Bridge Foot at Vauxhall. Two Chaldrons delivered within a mile of the Works on the Surrey side of the Thames at an additional charge of 2s. per Chaldron. A smaller quantity or delivery at a greater distance at a moderately increased rate.

HOT-WATER PIPES at wholesale prices, with Elbows, Syphons, Tee Pipes, and every requisite connection. Cast Iron Boilers, 55s. each. Improved Soot Doors and Furnace Doors. Builders' Castings of every description kept in Stock at—Mr. LYNCH WHITE'S, Old Barge Iron Wharf, Upper Ground Street (near Blackfriars Bridge), London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

SHEET GLASS (15 oz.) of good quality in 100 feet boxes.

10 in. by 8 in. and under	15s. per box.
11 in. by 9 in. to 22 in. by 14 in.	17s. „
Larger sizes to 28 in. by 18 in.	19s. „

Also similar sizes in 21 oz. Sheet at 24s. per box. Boxes charged 2s. each, and returnable at the same price, if delivered free. CRYSTAL WHITE GLASS, Crown and Sheet Glass in Crates, British and Patent Plate, &c. &c. White Lead, Oils, Turpentine, Colours, &c.—G. FARMILOE & SON, 118, St. John Street, West Smithfield.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

AN IMMENSE STOCK OF

GARDEN ORNAMENTS

AT NOW BE INSPECTED AT

AUSTIN AND SEELEY'S

ARTIFICIAL STONE WORKS,

Or Pattern Sheets will be sent by post to any Gentleman who may not have an opportunity to call.

KEPPEL ROW, NEW ROAD,

REGENT'S PARK, LONDON.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1*l.*—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square, London.

TESTIMONIAL.—The following Testimonial of the valuable efficacy of CUPISS'S CONSTITUTION BALLS is so excellent that the proprietor begs to call the attention of the public to a perusal of it.

"Combs, Stowmarket, October 25th, 1850.

"DEAR SIR,—Having for two years past experienced great trial with the lung complaint in my neat stock, last year having lost five out of seven, I employed an old experienced veterinary surgeon, with little or no success. The two cases saved I believe to be from the use of blisters on each side of the chest, and CUPISS'S CONSTITUTION BALLS, which you recommended; and this year having two cases of the same disease, quite as bad as the others, I adopted the same means of cure, and am happy to state with success, having saved them both. I cannot speak too highly of the use of the Balls; I believe them to be as good for neat cattle as for horses. I think this statement of importance to Agriculturalists, and as Agent for CUPISS'S Constitution Balls, you are at liberty to make use of the above information as you may deem fit.—Yours faithfully, "JOHN COBBOLD.

"To Mr. J. B. CUTTING, Chemist, &c., Stowmarket."

The Constitution Balls are prepared only by FRANCIS CUPISS, M.R.C.V.S., Author of the "Prize Essay on the Diseases of the Liver of the Horse," Diss, Norfolk; and sold by all respectable medicine vendors in town and country, in packets, six Balls each, 3*s.* 6*d.* per packet, with a wrapper giving full directions for the use of the Balls, and treatment of the animal whilst taking them. Any gentleman using the Balls may consult the Proprietor gratuitously, either personally or by letter post paid.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

LANDSCAPE GARDENER AND GARDEN ARCHITECT.

MR. W. DAVIDSON is about concluding his engagement with Sir William F. F. Middleton, Bart., of Shrubland Park, in consequence of the completion of extensive alterations on which he has been there employed; and respectfully tenders his services in the above capacities to Noblemen and Gentlemen, and the Public generally, in laying out or improving Gardens, Grounds, Parks, Cemeteries, Arboretums, &c. Mr. D. feels strongly the importance of the opportunities he has had of maturing his taste for natural arrangement and artistic design, under Sir William and Lady Middleton, and appeals with confidence to Shrubland for examples of his practical and scientific knowledge, as a Civil Engineer, in directing the satisfactory and economical execution of works in general. He begs to mention further, that his practical experience enables him to offer advice upon all subjects connected with a garden, both structural and cultural. Mr. D. will give careful attention to every matter, extensive or otherwise, in which his advice may be required, and will regulate his professional charges in proportion to the nature and extent of each particular case. Mr. D. is kindly permitted to refer to Sir William Middleton, Bart., Shrubland Park, Ipswich; Sir Charles Barry, Westminster; Dr. Lindley, and many others who are pleased to consider him worthy of their patronage and recommendation.

37, Bloomsbury Street, Bedford Square, London.

WANTED to Rent, from Lady Day, a SMALL FARM near London. A good House is required with 40 to 100 acres of Land (arable and pasture), and the requisite Outbuildings; and within 25 miles from town.—Apply, by letter, to the Editor of the *Agricultural Gazette*, 5, Upper Wellington Street, Strand, London.

TO BE LET ON LEASE, for a term from Michaelmas next, with the usual entry forthwith, a highly reputed CORN and STOCK FARM, in North Hants, containing 1057 acres, very compact, and with Market and Railway facilities.—To view and treat, apply to LAMB, BROOKS, & Co., Solicitors, Basingstoke, or Odiham, Hants. References as to substance and character will be required.

TO BE LET ON LEASE, FARMS IN DORSETSHIRE, on the Milton Abbey Estate, seven miles from Blandford, and 11 from Dorchester, with entry at 25th March, and 11th October next.

1st. DELCOMBE, in the parish of Milton Abbas, containing 335 acres or thereby, whereof 140 acres are Grass, and 195 arable; the greater part a deep, friable, calcareous loam. This farm is equally adapted for a mixed dairy and corn management, or for corn and stock. The buildings are commodious, and the farm residence is picturesquely placed on a lawn, with a walled garden. The farm is tithe free.

2d. ANSTEY FARM, in the parish of Hilton, now containing 304 acres, or thereby, whereof 190 acres are Grass and Meadow, and 114 Arable. This Farm has hitherto been occupied as a dairy and corn farm, for which it is well adapted, the land being well watered and of good quality. It is capable of much improvement by drainage and otherwise, for which every facility and encouragement will be offered by the landlord. The arable part of the farm is a friable loam on chalk, the Grass land in the vale a deep earthy soil.—For further particulars apply in London, to JAMES CAIRD, 9, Little Ryder Street, St. James's; and in Dorset, to WALTER ANDERSON, Milton Abbey, Blandford.—Jan. 27.

NURSERY AND SEED BUSINESS,

ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.

Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

TO BE LET, with immediate Possession, a NURSERY AND FLORIST BUSINESS situated in a first class neighbourhood near the Regent's Park. The ground is well stocked, and the Greenhouses, Pits, Frames, &c., contain a choice collection of Plants in the highest condition. There is an excellent Residence, with Stable, Coach-house, Potting and Store Rooms. It is well worthy the attention of any person wishing to carry on the business.—For further particulars inquire at the office, 10, Victoria Terrace, Belsize Road, St. John's Wood, London.

EGGS, from the Yards of Mr. G. BOTHAM, Wexham Court.—Prize Spanish, 30*s.*; ditto Brahma Pootras, 21*s.*; ditto White Cochin, 21*s.*; ditto Grey Dorking, ditto Red Speckled Dorking, ditto Silver Pencilled Hamburgs, ditto Duckwing, Game, ditto Rouen and Buenos Ayres Ducks, at 10*s.* 6*d.* per setting of 13.—May be had by sending a Post-office order, payable at Slough. Box and packing, 1*s.*

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

COCHIN CHINA FOWLS.

MR. PUNCHARD'S ANNUAL SALE.

MR. J. C. STEVENS begs to notify that he has received instructions from Mr. Punchard to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 30th January, at 12 o'clock precisely, a selection of first class COCHIN CHINA FOWLS, bred in the celebrated Yards of Blunts Hall, Haverhill, the Stock of which has been strengthened by careful importations, and the Birds from which were the winners of the Silver Vase, and also one other First Prize for Cochins, at the late Birmingham Exhibition.—May be viewed on the morning of Sale, and Catalogues had by inclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, Feb. 6, at 12 o'clock precisely, about 240 Lots of CHOICE POULTRY and PIGEONS, from the yards of E. Simons, Esq., Birmingham; R. J. Simpson, Esq., Sandbach; Mrs. Mills Ringwood, and others, consisting of Spanish, Cochins of all colours, Brahma Pootras, Hamburghs, Polands, Andalusians, Dorkings, Game, Malays, Sebright Bantams, a few Silver Pheasants, and some well bred carrier and other Pigeons.—May be viewed on the morning of Sale, and Catalogues had by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

POSTPONEMENT OF SALE.

MR. J. WILLMER begs to announce that the Sale at the Sunbury Nursery is in consequence of the inclemency of the weather postponed till the 13th and 14th of February, at 12 o'clock precisely each day.—Further particulars and Catalogues had by enclosing two postage stamps to Mr. J. WILLMER, Auctioneer and Valuer, Sunbury, Middlesex.

BROMPTON PARK NURSERY.

TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to an unreserved Sale by Auction, on the premises, the Brompton Park Nursery, Brompton, near the "Hoop and Toy," on MONDAY, February 5, at 11 for 12 o'clock precisely, by order of the Royal Commissioners for the Exhibition of 1851, in consequence of the land being required for the formation of new roads, a portion of the valuable Stock growing on the above celebrated Nursery, consisting of FRUIT TREES and EVERGREENS, comprising Standard and Dwarf trained and untrained Apple, Pear, Plum, Peach, Nectarine, Apricot, Cherry, a quantity of Vines, Clematis, and Ivies in pots, Rhubarb, &c.—May be viewed three days prior to the Sale. Catalogues may be had of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

JOHN WEEKS AND CO.'S
HORTICULTURAL ESTABLISHMENT, KING'S ROAD, CHELSEA.
THE WHOLE HEATED BY ONE BOILER.

THE LENGTHENED NOTICE of this Establishment, which appeared in the *Gardeners' Chronicle* of December 16, 1854, directed the attention of the Horticultural World to the great improvements made by Messrs. WEEKS & Co. in the method they have recently adopted for heating it, and in order to give some idea of the character of the Establishment to numerous Correspondents whose distance from town does not admit of their personally inspecting it at present, the adjoining sketch has been made, and the following observations are most respectfully submitted to them and all others interested in Horticultural proceedings.

This Establishment is now the most complete of any in the country, consisting of Conservatories, Greenhouses, Hothouses, and several Pits, with top and bottom heat, all appropriated to their several purposes.

Until very lately there were six boilers of various sizes, but all on the same principle, employed here to heat the different Houses and Pits, and although those boilers were found both efficient and economical during eight years, each doing three times more work than the common description of boiler, recent improvements convinced Messrs. WEEKS & Co. that highly important results were attainable by substituting one boiler, of a similar construction, for the six; and now, the whole of this extensive establishment is heated effectually by ONE boiler 5 feet high by 3 feet 6 inches in diameter, exposing to the immediate action of the fire a surface of 340 feet, superficial. The expense attending this great alteration of connecting all the pipes of the various houses and pits to one boiler will be fully repaid in one season. The boiler is fed from the top, which is nearly on a level with the surface of the surrounding ground, but there are furnace doors, and the usual openings in the brickwork below, from which it is cleared out, and to cause a draught. The glass-houses, which may be said to be built round the four sides of a long square, or parallelogram, which has a gentle rise to the end farthest from the boiler, are certainly well placed for being all warmed from one boiler, which is effected as follows:—The boiler is placed at, say, the right-hand corner of the square. A 4-inch flow pipe is led in a straight line from it on the same side to the bottom of the square, or as far as there are houses, and the return pipe is brought back to the boiler in the same drain immediately below it. Another main 4-inch flow and return pipe is taken through the show houses and down the other side of the square, to furnish means of heating the houses on that side, and from these two main pipes all the houses are warmed by connecting the pipes which are carried round them with the two main pipes just mentioned, which are also made to pass through as many houses as lie in their way; and in order that the heat they contain may be turned to as good an account as possible, the drains in which they are placed have been covered, inside the houses, with neat iron gratings, which permit the warmth to pass through into the houses.

The whole of the several Houses and Pits can be heated at one time, or separately, with a full command of heat, and any part regulated at pleasure.

If the Houses and Pits were placed in a line, they would extend about 1000 feet, exposing to the atmosphere upwards of 16,000 superficial feet of glass. The water circulates in the various Houses and Pits through 5000 feet of pipe.

An experience of upwards of thirty-six years as Horticultural Builders, and Hot Water Apparatus Manufacturers, having afforded Messrs. WEEKS & Co. constant opportunities for effecting important practical improvements in Building and Heating, induced them to build their present Nursery, so that the Nobility and Gentry about to erect Horticultural Buildings, might have the means afforded them of inspecting an extensive variety of Horticultural Houses and Pits with the Heating Apparatus in full operation.

The extraordinary efficiency and economy of the heating apparatus will perhaps be better understood by the following comparison of the work it does in Messrs. WEEKS' Establishment by One Boiler, and the work done by the 12 boilers at the Great Palm House, at the Royal Gardens, Kew:—

THE HOUSES AND PITS AT MESSRS. WEEKS AND CO.'S

Measure in length	1,000 feet
Superficial feet of surface covered	13,480 "
Surface of glass exposed to the atmosphere	16,000 "
Length of pipe to heat the whole	5,000 "
Fuel consumed in 24 hours during the winter months, at a cost of 3*s.* per day	3 sacks of coke.

The boiler requires attention only once in 12 hours, and then but for one hour; thus occupying a man but for two hours out of the 24, at a cost of say 8*d.* per day.

THE GREAT PALM HOUSE, KEW,

Measures in length	355 feet
Superficial feet of surface covered	23,900 "
Surface of glass exposed to the atmosphere	42,200 "
Length of pipe to heat the whole	15,000 "
Fuel consumed in 24 hours during the winter months, being two parts coke and one part coal, at a cost of 4*l.* 16*s.* per day	72 sacks

The boilers, 12 in number, occupy the whole attention of two men by day and one by night, at a cost of say 10*s.* per day.

It results from the foregoing statements that the Apparatus of Messrs. WEEKS, with one boiler, is doing about as much work as four boilers do in the Kew Palm House; and that with three, or, at most, four boilers such as Messrs. WEEKS have now in use, the Great Palm House at Kew could be heated at a cost in fuel and labour of 14*s.* 8*d.* per day, effecting a saving of, say 1095*l.* per annum. Messrs. WEEKS assert that there is not in the kingdom an apparatus doing anything like the same work with one boiler, nor, under any circumstances, at so trifling an expense.

The Nobility and Gentry who may honour this Establishment with a visit will be no less struck with the extensive and splendid collection of STOVE and GREEN-HOUSE PLANTS, which are kept in the highest state of cultivation and are for sale at very low prices, than they will be by the very perfect arrangements above described for supplying each compartment with the necessary warmth. They will also find a fine assortment of strong GRAPE VINES in pots from eyes, all of the best sorts, and STRAWBERRY PLANTS for Forcing in the finest condition.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to

JOHN WEEKS & CO., King's Road, Chelsea, London.

HORTICULTURAL SOCIETY OF LONDON.—The WINTER MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, February 6, from 12 to 4 P.M.

KENILWORTH AND LEAMINGTON HORTICULTURAL and FLORICULTURAL EXHIBITIONS for 1855.

The KENILWORTH EXHIBITION will be held (by permission) among the Ruins of Kenilworth Castle, on WEDNESDAY, 4th of July next.

The SECOND EXHIBITION will be held at the Arboretum, Leamington, on WEDNESDAY, the 22d of August next.

Full particulars will be duly announced. J. CHEYNE, Sec.

The Priory Gardens, Warwick, Feb. 3.

ENROLLED AGREEABLY TO ACT OF PARLIAMENT.

UNITED GARDENERS' BENEFIT SOCIETY, Waterloo Arms, Camberwell, Surrey. Instituted 1839.

This Society (established for Gardeners only under 35 years of age), has proved for 16 years the accuracy and soundness of principle upon which it is founded, namely, the highest amount of benefits to be received by its Members in Sickness, Superannuation, and Mortality, for the smallest amount of contribution consistent with stability and permanence. The accounts are always open to the inspection of all the members, who have also the control of the expenditure of its funds; it is therefore incumbent on all, by a small monthly contribution, to provide against the casualties of life, from which none are exempt, by enrolling themselves in a Society of this nature, which guarantees 12*s*. per week in sickness; 3*s*. and 4*s*. per week superannuation; 10*l*. at the death of a member, and 8*l*. member's wife, for the small contribution of 2*s*. 3*d*. per month.

Camberwell Green, Surrey. CHARLES STUNELL, Secretary.

DAVID FERGUSON, LANDSCAPE GARDENER and CONTRACTING PLANTER, Stowe, Buckingham.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

CEMETERIES.

WILLIAM MASTERS AND SON having been engaged upon extensive Cemetery works, are prepared to undertake the LAYING OUT and PLANTING NEW GROUNDS, as well as the Ornamenting such as are closed by the recent Act of Parliament, by contract or otherwise.—WILLIAM MASTERS & SON, Landscape Gardeners, Canterbury.

MANGOLD WURZEL SEED, LONG RED, and YELLOW GLOBE, warranted genuine, and the growth of 1854. Price 45*l*. per ton.—Apply to R. S. HEWS, Kelvedon, Essex.

NEW SEEDS JUST HARVESTED *can now be obtained of the most genuine description, from* WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

TRUE PENZANCE BROCCOLI, *saved by one of the best growers in the neighbourhood of Penzance*, 1*s*. per packet, from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

SEED POTATOES.

SUTTON AND SONS, SEED GROWERS, Reading, have a large STOCK of the best early kinds of POTATOES, very true and free from disease. Prices, &c., with instructions on cultivation, will be found at page 20 of SUTTON'S Seed and Plant List, just published, price Sixpence (or gratis to purchasers).

SUTTON & SONS, Seed Growers, &c., Reading.

NEW ASHLEAF—THE "EARLY CHAMPION."

JOSEPH WILSON, SEEDSMAN, Ipswich, begs to state that his stock of early SEED POTATOES comprises the following splendid varieties, grown expressly for seed purposes, and free from disease. The "Champion" Ashleaf, 12*s*., a new variety, sent out for the first time this season; they are about 10 days earlier than any other Ashleaf, finer in flavour and more prolific. Jackson's improved early Ashleaf, 9*s*.; the Short top Ashleaf, 7*s*. 6*d*.; Nonpariel Kidneys, 6*s*. 6*d*.; Moss Kidneys, 6*s*. 6*d*.; British Queens, 7*s*. 6*d*., the earliest round variety known. Early Frame and Ashleaf Seedlings, 8*s*. per bushel. Free to London: no charge for sacks. A remittance must accompany all orders.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included. To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

Post-office Orders to be made payable at Middleton, Lancashire.

SUTTON'S SHORT SEED LIST.

SUTTON'S SHORT SEED LIST, *containing only the most desirable sorts, will be sent post free, in return for one penny postage draft or receipt stamp.*

SUTTON & SONS, Seed Growers, Reading, Berks.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY for 1855 *is now published, price* 6d. *To be had of all Booksellers, and from* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth*

MESSRS. J. AND H. BROWN'S NEW PRICED CATALOGUE can be had by post. American Plants, Coniferæ, Orchidea, Stove and Greenhouse Plants, Fruit Trees, &c. A separate List of Garden and Flower Seeds.

Albion Nursery, Stoke Newington, London.

BASS AND BROWN'S SEED AND PLANT LIST FOR 1855, sent free by post for three penny stamps.

It contains as usual a large number of the most attractive and popular new articles, with much descriptive and useful information.

The AUTUMN PLANT LIST also for three penny stamps.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

LOUIS VAN HOUTTE'S SEED CATALOGUE is to be had at MR. R. SILBERRAD'S, 5, Harp Lane, Great Tower Street, London.

FRUIT TREES, FOREST TREES, EVERGREEN SHRUBS, &c. Catalogues of the above may be had on application to WILLIAM BARRATT, Wakefield.

☞ A quantity of fine Transplanted White Thorns.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

NEW SHRUBBY CALCEOLARIAS.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that a Descriptive Catalogue of his beautiful new Shrubby Calceolarias is now ready, and may be had upon prepaid application.

Very choice Calceolaria and Pansy Seed, 2*s*. 6*d*. per packet. Postage stamps are respectfully requested in payment of the seeds.

CAREY TYSO'S CATALOGUE OF FLORISTS' FLOWERS FOR 1855 may be had post free for two labels; TREATISE ON RANUNCULUS for eight labels; ditto on ANEMONE for four labels.

RANUNCULUSES, 100 splendid named sorts, 40*s*. to	£4	0	0
" 25 superb seedling ditto ...	1	10	0
" 100 fine mixtures ... from 8*s*. to	1	0	0
DOUBLE ANEMONES, 50 fine named sorts, 10*s*. to	0	13	0

IMPORTED GERMAN SEEDS.—Asters, Balsams, Stocks, Larkspurs, Poppies, Zinnias, &c., in named assortments, 2*s*. 6*d*. each. Ranunculus and Anemone Seeds, 2*s*. 6*d*. per packet.

C. TYSO's sovereign assortments of 18 select Ranunculus, and 18 choice Anemones, postage free for 21*s*.—Wallingford, Berks.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

W. DRUMMOND AND SONS' NEW DESCRIPTIVE CATALOGUE, containing select varieties only, of VEGETABLE and FLOWER SEEDS is now ready, and may be had post free on receipt of one postage stamp. This Catalogue will, at a glance, furnish the Gardener with all the necessary material for drawing out his Seed List correctly and without trouble. In reference to it the *Gardeners' Chronicle* remarks:—

"It is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon for the sake of both buyer and seller;" and this opinion has been cordially responded to by all our old and many new customers.

W. DRUMMOND & SONS' Seed and Implement Warehouse, Stirling.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren, very large and firm heads. Price to the trade 24*s*. per lb., smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.

Seed Establishment, 181, High Holborn, London.

EARLY WHITE FIELD PEA.—NEW EARLY RACEHORSE—comes off early in July in time for Turnips and is a good cropper. Price 12*s*. per bushel.

SUTTON & SONS, Seed Growers, Reading.

GOLDEN DROP GREEN FLESH MELON, SIX SEEDS FOR 1*s*. 6*d*.

WILLIAM WOOD AND SON beg to inform their Friends and the Public that they have sold their stock of Seeds of the above superior Melon to Mr. EDWARD TILEY, Nurseryman, 14, Abbey Churchyard, Bath, who will be happy to supply orders for the same.

GOLDEN DROP GREEN-FLESHED MELON.

J. CHARTRES AND CO. have a limited quantity of Seed of this splendid variety, which they can with confidence recommend. It is of moderate size, oval shape, and beautiful gold colour. Six seeds, 1*s*.

Seed Warehouse, 74, King William Street, City, London.

CONQUEROR OF THE WEST CUCUMBER.—A Packet, containing 12 good seeds of this first-rate Frame Cucumber, which for productiveness is second to none, will be sent post free, on receipt of 12 postage stamps, addressed to JAMES LAKE, Nurseryman, &c., Bridgewater.

GENUINE SEEDS.

JAMES CHARTRES AND CO. beg to inform their patrons and purchasers of Seeds generally that their unrivalled stock is now arranged, and they earnestly solicit early orders, as many choice articles are deficient in quantity this season. A Catalogue may be had upon application.

Seed Warehouse, 74, King William Street, City, London.

GENUINE SEEDS.

THE MEMBERS OF THE "SEED GROWERS SOCIETY," continue to supply genuine AGRICULTURAL, VEGETABLE and FLOWER SEEDS at Growers prices. Lists with price and terms of business may be had on application to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex.

IPOMŒA RUBRO CÆRULEA.

GEORGE ROBERTS begs to acquaint the Seed Trade that he can supply the above choice seed at a considerable reduction on the prices of past years.

32, Moorgate Street, London.

TO THE TRADE.

J. ROY, Jun., SEEDSMAN, Aberdeen, has got to hand a consignment of 35 bales of very superior CUBA BAST The bales weigh about 1½ cwt. each. Price forwarded on application.

YEWS FOR HEDGES.

EDWARD SANG AND SONS, Kirkaldy, have for sale, at a low price, a large quantity of fine healthy YEWS, once, twice, and three times transplanted, in various sizes, from 12 to 30 inches high.

WANTED, FRUIT AND VEGETABLES.—LIVERPOOL PRICES.

PINE APPLES, 2 lbs. and above	5*s*. 6*d*.	to 5*s*.
CUCUMBERS, each	2*s*. 6*d*., 2*s*., 1*s*. 6*d*.,	to 1*s*.
ASPARAGUS, per hundred	5*s*., 7*s*. 6*d*.,	to 10*s*.

Other kinds in like proportion.

Forward Immediately to GEORGE TAYLOR, JUN., FRUIT SALESMAN, St. John's Market, Liverpool.

CIDER APPLES.

WANTED, a few dozen Strong Standard CIDER APPLES, amongst them the COCKAGEE; also a few Standard PERRY PEARS. Any one having either of the above to part with, may hear of a purchaser by applying to G. WYATT, Nurseryman, Seedsman, &c., High Street, Banbury, Oxon.

WANTED to Purchase 150,000 three years' Transplanted QUICKWOOD.—Address, cash price, to Mr. J. NICHOLSON, 48, Lowgate, Hull.

TO THE TRADE.—SEEDLING BEECH.

WILLIAM TAYLOR, NURSERYMAN and SEEDSMAN, Cupar, Fife, has to offer 100,000 one-year Seedling BEECH, very fine. Price may be had on application.—Seed Warehouse, Cross, Cupar, Fife. Feb. 3.

TO BE SOLD, at Prices that will be sure to give satisfaction, 10,000 STRONG CURRANTS of the following sorts, viz.:—Red and White Dutch, common Black and Black Naples, Wilmot's Superb Red, Champaign and Raby Castle. Also a quantity of strong dwarf-trained Pears and Plums of the best sorts, Fastolff and other Raspberries, strong standard Pears, and a quantity of prime Seed Potatoes, well kept, of the best sorts.—For further particulars, apply to JAMES LAKE, Nurseryman, Bridgewater.

FRUIT TREES, SURPLUS STOCK.

APPLES, PEARS, PLUMS, CHERRIES, GOOSEBERRIES, & CURRANTS.

TO BE SOLD, at any reasonable offer, for the purpose of clearing some ground, several hundred Pear trees, comprising Winter Nelis, Gracilis, Williams' Bon Chrétien, Hazel, Summer, Portugal, Beurré Capiaumonts, and other varieties. 400 Wellington and Quarrinton Apples, 200 Prince of Wales and Magnum Bonum Plums, 50 Duke Circassian and Morello Cherries. All the above of about 10 years' growth, and coming into full bearing. 10,000 Rifleman Gooseberry Plants, from 1 to 4 years old, and 2000 large Red Grape Currants, 2 years old.

To view, apply to Mr. MITTON, Lampton, 1 mile from either the Isleworth or Hounslow Stations of the South Western Railway.

VEGETABLE AND FLOWER SEEDS.

PETER LAWSON AND SON beg leave to intimate to their English customers and the public that they are prepared to supply from their London establishment assortments of GARDEN and FLOWER SEEDS of superior quality, comprising all the esteemed standard sorts and those recently introduced. They will be happy to send Catalogues on application.

P. L. & Son have also to intimate that they will shortly issue their LIST of AGRICULTURAL SEEDS, all of which have been carefully saved from the most select stocks.

Liberal arrangements will be made for the carriage of their seeds to all quarters.

PETER LAWSON AND SON,
Queen's Seedsmen, Wood Foresters, &c., for Scotland, and to the Highland and Agricultural Society, 27, Great George Street, Westminster, London.

LYNCH'S STAR OF THE WEST CUCUMBER.

—This might with propriety be called the Champion of the West, for it has won 11 prizes at different Horticultural Exhibitions. It is a seedling raised by Mr. Lynch, the well-known gardener to the Right Hon. the Earl of St. Germans, Lord Lieutenant of Ireland. He has grown it for several years, and has beaten everything that has been put in competition with it, including all the newest and most recently introduced varieties. We have purchased the whole stock, having given a very large sum for all the seeds in his possession, and it is now for the first time sent out; those who want a good flavoured, prolific, and prize Cucumber, we would recommend to obtain a packet of the seeds.

It is a first-rate winter fruit, and, with careful management, can be had in perfection all the year round. It is most prolific, and bears two fruit on every joint, and as many as 42 have been counted on a single plant in a tub from 5 to 22 inches in length. The fruit is quite round, like the barrel of a gun, and free from any ribs or roughness on the skin. It has a short handle, and is in every way calculated to beat any other sort in cultivation. The spines are white, and they stand out in the most prominent way. The stock is very limited.

Three seeds, per packet, 1s. 6d. | Five seeds, per packet, 2s. 6d.

The following is an official account of the number of Prizes won by Mr. Lynch, in competition with all the best Gardeners and the best varieties in the neighbourhood:—

"Royal Devon and Cornwall Horticultural Society, Nov. 11, 1854.

"Dear Sir,—The prizes awarded you for your Cucumber are as follows:—

1851.—May 15th, First Prize	1852.—Sept. 9th, First Prize
" July 17th, Extra Prize	1853.—June 8th, Second Prize
" Sept. 4th, First Prize	" Sept. 8th, First Prize
1852.—May 27th, First Prize	1854.—June 1st, First Prize
" July 22d, First Prize	" Sept. 9th, First Prize

In all, 10 Prizes.

"I remain, dear sir, yours truly,
"NATHANIEL J. EASTON, Hon. Sec.

"Mr. R. Lynch, Gardener to Earl of St. Germans, Port Eliott."

WM. E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Theringham, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2s. 6d. each.

Each may be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

HOLCUS SACCHARATUS,
OR CHINESE SUGAR CANE.
(See GARDENERS' CHRONICLE, Dec. 30th, 1854.)

MR. JOHN HENDERSON, formerly of the firm of JOHN A. HENDERSON & Co., Pine Apple Place, London, has the honour to announce that he is prepared to supply Gentlemen, Amateurs, and Professionals, with seed of this most valuable and estimable plant.

As the Dioscorea Batatas seems well adapted to make good any deficiency arising from failure in the Potato crops, so this appears admirably calculated to meet many wants of the present day. That it may be used for the purposes of distillation, and may therefore preserve the grain of the country, is not less certain than that the leaf and stem (after the saccharine matter has been extracted) contain a large amount of fibre, of such a nature as can be employed in the manufacture of every kind of paper. In both these points, as well as in many others, this plant demands the attention of every Gardener and Amateur throughout the country; the more so as from the necessity that at present exists for the production of fibres that may be used in paper manufacture a due remuneration may be fairly expected by growers, even after the plant has, so to speak, paid itself by the saccharine matter extracted from it.

Mr. HENDERSON hopes, in a few days, to have ready for the press a more lengthened account of this plant, as well as a complete statement of the latest experiments in connection with the Dioscorea Batatas. As there are many varieties of the Holcus W. J. H. can only be responsible for seed forwarded by himself, which he is prepared to do in sealed packets, at 1s., 2s. 6d., 5s., and 10s., according to quantity.

Orders to be accompanied with a remittance to Mr. JOHN HENDERSON, Kingskerswell, Newton Abbot, South Devon.

P.S. Price to the Trade can be had on application.

BANKS' NEW SEEDLING FUCHSIAS FOR 1855.

W. J. EPPS begs to state that he has purchased the following Seedling Fuchsias, raised by that celebrated grower, E. BANKS, Esq., of Sholden Lodge, Deal; they were the first selection from his splendid batch of Seedlings of 1854, and have been thoroughly proved. They are distinct, rich, and the greatest advance upon any of the kinds known, and cannot fail to give the highest satisfaction.

CLIMAX.—(named by Mr. BANKS.)—Tube stout, sepals very broad reflex, with a pretty curve or half circle, the points of the petals touching the seed vessel; colour, rich velvety crimson—the corolla is very large, of a splendid violet blue and great substance: habit, robust, and blooms particularly free. 7s. 6d.

FAIRY QUEEN.—Very distinct and striking, immense bloomer, beautiful waxy white tube and sepals, tinged with lemon; long well-proportioned flower; corolla large, and of a very rich plum colour puce. 7s. 6d.

GRAND SULTAN.—A very noble flower, and will be many years before it is equalled; beautiful foliage, and first-rate for exhibiting; flowers large, very stout, sepals reflex, similar to the Turn Cap Lily, and of avery rich crimson colour; corolla large, and very dark velvety purple. 7s. 6d.

MAID OF KENT.—This Fuchsia is pronounced by the following judges, viz., Mr. Edwards, Secretary to the Floricultural Society; Mr. Barnes, of Camden Nursery; Mr. Todd, of Sutton, to be the prettiest and most distinct Fuchsia yet raised; habit, dense and bushy, producing great clusters of pretty reflexed blooms, of great substance, very clear waxy white, with a rich plum-coloured puce corolla, and exceedingly striking. 10s. 6d.

BEAUTY OF THE BOWER.—A very rich and perfect formed flower, scarlet tube and sepals, which reflex over the tube, displaying a beautiful dark purple corolla of great substance: habit, perfect. 7s. 6d.

OMER PACHA.—A large and well-proportioned flower, with dark crimson tube and sepals: corolla, intensely dark velvety purple: habit, excellent and very graceful. 7s. 6d.

The Set will be sent out in April.—Strong Plants, at 42s. The usual discount to the Trade where three of each are taken.

Agent:—HURST and M'MULLEN, Seed Merchants, Leadenhall Street, London.—Bower Nurseries, Maidstone.

SPRUCE FIRS from 6 to 9 feet high, well-rooted and quite safe to remove, being well adapted for screens, filling up old plantations, or for immediate effect.

FINE BEECH fit for hedges or plantations, 6 feet and upwards.

G. WHEELER, Nurseryman, Warminster, Wilts, having a surplus stock of the above, is disposed to sell them on extremely moderate terms, which may be obtained on application.

G. W. has a good stock of SCOTCH FIRS, 2 to 3 feet, a large stock of RHODODENDRON suitable for cover in woods, plantations, drives, &c., from 1 foot and upwards, with fine strong American Azaleas, at very moderate prices.

SEEDLING CALCEOLARIA, raised from the finest spotted kinds, will be sent carriage free on receipt of a Post Office Order for the amount, at 30s. per 100. Per doz.

BULBS OF TIGRIDIA PAVONIA, Red Tiger Flower... 2 0
" " CONCHIFLORA, Yellow ditto 4 0
" " WHEELERI, Scarlet ditto ... 4 0
Carriage free for cash.

CUCUMBERS, first-rate.—THE KING, a very handsome Black Spine, and Ingram's Hybrid White Spine, a most prolific kind, both approved and esteemed sorts, at 1s. per packet.—G. WHEELER, Warminster, Feb. 3.

MESSRS. E. G. HENDERSON AND SON will commence sending out plants in April next of their new Seedling Fuchsias, with white Corollas, both double and single, and some others with blue, violet, and variegated Corollas (For description and price see back No. of this Journal for Jan. 27th, 1855), or a printed list will be sent free by post on application; and a coloured plate of three of the varieties will be sent post free on receipt of six postage stamps.

QUEEN VICTORIA.	EMPRESS EUGENIE.
PRINCE ALBERT.	RAFFAELLE.
MRS. STORY.	LADY OF THE LAKE.
RANUNCULIFLORA.	WATER NYMPH.
PERRUGINO.	BANKS'S FAVOURITE.

The entire stock of all Seedling Fuchsias distinguished with a white Corolla were purchased for ONE HUNDRED GUINEAS of the late W. Story, Esq., of Newton, in the county of Devon, who succeeded in introducing this great novelty. And in consequence of an advertisement which appeared a few weeks back in the *Gardeners' Chronicle* from Messrs Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of Mr. Story, and after a written communication with that gentleman (who was then confined to his bed by illness) it was thought necessary for one of the firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, when he was informed by a jobbing gardener at Newton that he had received Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son think the above explanations necessary in consequence of a great number of their customers having ordered them at higher prices than those quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to the above.—Wellington Nursery, St. John's Wood, February 3.

NOTICE.

EDWARD TILEY having received several letters wishing to know if his new seedling "Champion Kidney" Potato is the same as the one advertised by Mr. Joseph Wilson, of Ipswich, under the name of "The Early Champion Ashleaf," begs to say that it is not, for he purchased the whole stock from the Grower, who obtained it in the first instance from the seed of the Potato Apple, and has never parted with any of the produce but to him. E. T. feels confident that it will give the greatest satisfaction to all purchasers who may favour him with orders for the same.

TILEY'S SEEDLING POTATO—THE CHAMPION KIDNEY.—Never before sent out.

This Potato bears a great resemblance to that fine old Potato, the Ashleaf Kidney; it possesses the following good qualities over the Ashleaf. If planted at the same time it will be ten days earlier, all the sets always vegetate well, and do not die off in the ground as the Ashleaf does; 2 pecks of seed will produce a greater weight of Potatoes than 3 pecks of the Ashleaf. It is quite equal to that in flavour, and is eatable during the whole winter. Sets that have had the shoots broken off five or six times during the spring will vegetate again as if it had been the first shoot. About twenty Gentlemen and Gardeners who had seed to plant last season have assured me that they never before grew any Potato to equal it, and should continue to grow it as a first early Potato. Numerous orders have been already received from persons who saw it growing during the last summer. It has been grown and thoroughly proved for the last four years, and found to be less liable to disease than any other Potato that has been grown. Out of 25 sacks grown this season there was not a single diseased Potato among them.

Sold in quantities of not less than 1 peck; they will be sent Hamper and Package free, at 5s. 6d. per peck, or 4 pecks for 1l. hamper free. A remittance in cash must accompany all orders, or small amounts in penny postage stamps. Purchasers would do well to name the nearest railway station to their residence.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST,
14, Abbey Church Yard, Bath, Somerset.

PAGE'S PRODIGY PEA,

THREE SHILLINGS & SIXPENCE PER QUART.

PAGE AND CO. can now supply the above, and beg to refer to Mr. James Duncan's letter of May 14, with Dr. Lindley's remarks, in the *Gardeners' Chronicle* of May 20, 1854:—

"Seeds of this very dwarf and early variety were obtained from Messrs. Page & Co., of Oxford Street, Southampton, whose name it bears, and were sown side by side with many others the first week of December last. It has proved equally early as the Frame and Dancroft Rival, and much more so than the Longpod and Dwarf, to which it bears some resemblance, but it differs from that variety in the leaves being somewhat smaller and the plant of a more dwarf habit. I send raw specimens of both sorts to show their difference, and the precocity and prolific habit of the Prodigy Pea. I have found it an admirable variety for cultivating on the beds of the large fruit house at this place, and I consider it well adapted either for pot or frame culture, or for growing at the bottom of fruit-tree walls, where a protection could readily be afforded it from the inclemency of the weather." *James Duncan, Raby Park, May 14.* [The Prodigy was covered with small pods, containing on an average four Peas each, while the pods on the Longpod had scarcely formed, and of course contained no Peas fit for use.]

No. 1. A Complete Collection of Garden Seeds ...	£3	0s.	0d.	No. 1. 100 packets of Beautiful Flower Seeds	£1	5s.	0d.
" 2. Do. do. do.	2	0	0	" 2. 50 do. do. do.	0	15	0
" 3. Do. do. do.	1	5	0	" 3. 25 do. do. do.	0	8	0
" 4. Do. do. do.	0	15	0	" 4. 12 Hardy Annuals	0	1	0

Fine Double Tuberoses, 4s. per dozen.

FINEST MIXED PERMANENT PASTURE and LAWN GRASSES, not to be surpassed in the Trade; and it is with pleasure Her Majesty's beautiful grounds at Osborne Palace, the Southampton Parks, &c. can be referred to.

Offices and Warehouses, 37 & 38, Oxford Street, adjoining Radley's Hotel,
(ONE MINUTE'S WALK FROM THE RAILWAY AND DOCKS) AND
58, Above Bar, Southampton.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON's process may be widely known, as it is a great boon.—I am, &c.,

JOHN SHANKS,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & CUMMINS, Seedsmen, Covent Garden; and JOHN KEENAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

CHOICE CALCEOLARIAS.

J. COLE begs to offer a few dozen of his unbloomed Seedling HERBACEOUS CALCEOLARIAS from his choice stock; they were the admiration of all who saw them last summer. They are not potted off, though strong enough for large 60-sized pots. The Seed was saved from selected stock, carefully impregnated. J. C. offers them at 4*s.* per dozen, or 25*s.* per hundred. A remittance solicited from unknown correspondents.—Keyfield Nursery, St. Alban's, Herts.

JOHN HOLLAND can supply, in strong plants, the heaviest Lancashire Show GOOSEBERRIES (named), of excellent flavour, and large size, at 6*s.* per dozen, on receipt of Post-office order, payable to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

GENERAL SEED ESTABLISHMENT, NORTHAMPTON.

JOHN JEYES begs leave to inform his Patrons and Friends that his general stock of Seeds is now complete, and that he shall feel obliged by their early orders. He has a good supply of all those various Seeds his Establishment has long been celebrated for, such as Matchless Cabbage, Imperial Cos Lettuce, Conqueror Pea, Blood Red Beet, Dwarf Prolific Bean, Snow's Green Cos Lettuce, do. Broccoli, Northampton Market Broccoli, Giant Asparagus, &c. &c.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s.* per doz.; HOWARD'S PRINCE ALBERT, 12*s.* per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford, Feb. 3.

CHEAP AND GOOD CINERARIAS.—Fine flowering plants from Turner's best seed in large 60 and 48 pots, just coming into bloom, at from 4*s.* to 6*s.* per dozen. Also fine plants of named varieties, consisting of Mr. and Mrs. S. Herbert, Adela Villiers, Garland, Constellation, Lady H. Campbell, Kate Kearney, Flora M'Ivor, Étoile de Venus, &c., at 9*s.* per dozen.—WOOD & INGRAM, Nurseries, Huntingdon.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

CHARLES SHARPE AND CO., SEED GROWERS, beg most respectfully to invite the attention of the Trade to their very superior stocks of Carrot, Mangold Wurzel, and Turnip Seeds, all of which have been carefully grown by themselves. Pfices may be had on application.

DIOSCOREA JAPONICA.

C. S. & Co., have received from abroad a quantity of Roots of the above, and will be glad to supply the Trade. Prices on application.

Nursery and Seed Establishment, Sleaford.

SNOW'S SUPERB BROCCOLI.—Every seed new and true. Sealed packet, 1*s.*; per oz., 3*s.*; pound bags for the trade on liberal terms.

GLENNY'S IMPROVED BALSAM.—Unequalled for size, doubleness, and colour; 6 classes, 3*s.*; mixed, 1*s.*; sealed packets with culture.

DOUBLE HOLLYHOCKS from noble flowers. Sealed packet, 1*s.*

Stamps or P.O. orders to GEORGE GLENNY, Horticultural agent, Dungannon House, Fulham. Sales, valuations, &c., attended; Ground Laid Out, Rockwork, Ornamental Water, &c., planned and executed.

POLYANTHUS SEED.

JAMES WOODS has again this year to offer a quantity of POLYANTHUS SEED, saved with more than ordinary care, from named and good laced flowers, which he can recommend with confidence, having had numerous Testimonials from different parts of the Kingdom of good and valuable flowers being raised from his seed. He will be able to send seed to grow 300 plants, with directions for sowing. Price 1*s.* per packet, or sent free, on receipt of 13 postage stamps to JAMES WOODS Florist, Harwich, Essex.

P.S. Plants of Polyanthus will be sent out in April, with blooms on each plant, with name or otherwise, from 6*d.* to 3*s.* 6*d.* per plant.

J. W. has a small quantity of Auricula Seed, saved from a fine collection of Alpines, at 1*s.* per packet as above.

WILD'S IPSWICH STANDARD CUCUMBER, the best in the world for Table, Market, or Exhibition, 2*s.* 6*d.* per packet.

EXTRACT OF A LETTER FROM A SUBSCRIBER.—"As to Cucumbers, I have four varieties now in bearing, but the 'Ipswich Standard' eclipses the lot. I am now (11th January), cutting splendid fruit 14 to 18 inches long, coming up to your standard of 12 diameters in every stage of their growth, viz., at 12 inches long 1 inch diameter; at 18 inches, 1½ inch. I have no hesitation in saying that your Cucumber is a perfect beauty, and the best doing one I ever saw. P.S. I will send you a specimen shortly, which I would thank you to send to Dr. Lindley."

Semi-double PRIMULA SINENSIS, in five colours, the best ever seen, 2*s.* 6*d.* per packet.

"My opinion of them is that they are not only the best that have yet been obtained, but possess a new character in the velvety substance of their petals."—*Mr. D. Beaton.*

Agent, Mr. CHAS. TURNER, Royal Nursery, Slough.
THOMAS WILD, Ipswich.

TWO NEW CUCUMBERS—"SIR COLIN CAMPBELL" AND "GENERAL CANROBERT."—For the full Description of the above two unequalled Cucumbers, and the List of EDWARD TILEY'S Collection of Cucumbers and Melons, which have all been thoroughly proved, see Advertisement and Cut in the *Gardeners' Chronicle* of January 13, 1855.

Sir Colin Campbell ... ... 3*s.* 6*d.* per packet.
General Canrobert ... ... 3 6 "

A packet of either of the Melons mentioned in the former Advertisement will be given to the Purchaser of the above two Cucumbers. A remittance in cash or penny postage stamps must accompany every order, and the whole or any part (as the case may be) will be immediately forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somersetshire.

SUPERB HOLLYHOCKS, ROCKETS, SEEDS, ETC.

WILLIAM CHATER'S descriptive list of his superb HOLLYHOCKS, containing hints on their culture and observations on exhibiting, &c., may be had on application by enclosing a postage stamp. Packets of seed, consisting of 20 varieties, selected from the best show flowers, 5*s.*; 12 varieties, 2*s.* 6*d.*; and from good double sorts, 1*s.*

Very superior Quilled German Asters, 12 distinct varieties, separate, 2*s.*, mixed 1*s.* per packet. Also Choice French Asters, 12 varieties, separate, 3*s.*, mixed, 1*s.* 6*d.* Fine Quilled African Marigolds, lemon and orange, 6*d.* per packet.

New Double Crimson ROCKET, excellent bedding plant for spring flowering, 6*s.* per dozen, or 2*l.* per 100. Double French White, 4*s.* per dozen, or 30*s.* per 100.

Saffron Walden Nursery, February 3.

GODFREY'S BLACK SPINE.

SPLENDID AND PROLIFIC FRAME CUCUMBER.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom; average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2*s.* 6*d.*; 6 ditto, 1*s.* 6*d.*

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1*s.* each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, February 3.

GARAWAY, MAYES, AND CO., having a large Stock of LILIUM GIGANTEUM Seed, can supply full picked seed at 10*s.* 6*d.* per 100.

G., M., and Co. can supply DIOSCOREA BATATAS at the advertised prices. Early application is requested, as the stock is limited.

Catalogues of Kitchen Garden, Flowers, and Agricultural Seeds, may be had on application. Prices if desired. For prices of Cucumber and Melon Seeds see Advertisement of Dec. 30, 1854.

Dordham Down Nurseries, Bristol, Feb. 3.

HOLLYHOCKS.

JOHN CHATER AND SON offer the following New and Choice HOLLYHOCKS in Pots at 18*s.* per dozen, hamper included:—Pourpre de Tyre, Yellow Model, Saffranot, Duke of Rutland (new), Penelope, Swansdown, Gem, Lady Braybrooke, Spectabilis, White Perfection, Black Prince (new), King of Roses, Raphael, Napoleon, Magnum Bonum, &c.

Also the following strong ground Roots, 7*s.* 6*d.* per dozen:—Queen, Bella Donna, Elegans, Brilliant, Marmion, Mrs. Russell, Venosa rubra, Obscura, Aurantia, Purpurea elegans, Flower of the Day, Marchioness of Breadalbane, Queen of England, and Model of Perfection.

New Crimson Rockets, 6*s.* per dozen; Double White do., 3*s.* per dozen, 20*s.* per 100.

Hollyhock Seed, in packets containing 200 seeds, 1*s.* 6*d.*; 400, 2*s.* 6*d.*; warranted from best flowers. Choice Pansy, 1*s.* per packet. Sweet William, 6*d.*

Descriptive Catalogues may be had on application to J. CHATER & SON, Haverhill, Suffolk.—Post Office Orders payable at Haverhill.

GRASS SEEDS.

SUTTON'S GRASS SEEDS (CARRIAGE FREE). NATURAL GRASS SEEDS FOR PERMANENT PASTURES, separate or mixed, expressly to suit the soil.—Messrs. SUTTON and SONS having for many years paid especial attention to the examination of Natural Pastures, and the collecting of the Grasses which thrive in the various soils of Great Britain and Ireland, are enabled to supply the sorts and quantities of Seeds, varied to suit the soil for which they are intended. The cost will vary from **24s.** to **30s.** per acre, according to the sorts and quantities the soil requires.

FINE LAWN GRASS SEEDS, for making New or improving Old Lawns, price **1s.** per pound, 2*s.* 6*d.* per gallon, or 20*s.* per bushel. For forming new Lawns, 2½ bushels, or 50 lbs., is the quantity required per acre.

FINE GRASS AND CLOVER SEEDS FOR IMPROVING OLD PASTURES (SUTTON'S Renovating Mixture). Quantity required per acre, 8 lbs. to 12 lbs. **price 9d.** per lb.

N.B. *It will be seen above that we have greatly reduced the prices of our Grass Seeds this season, especially the fine Lawn Seeds and "SUTTON'S Renovating Mixture" for improving Meadows and Pastures; and we doubt not that our liberal charges will induce a more general practice of sowing our superior kinds of Grass Seeds.*

SUTTON & SONS, Seed Growers, Reading, Berks.

R. PARKER begs to offer the following CHOICE SEEDS, all of which are warranted new and true to name: GODFREY'S (BLACK SPINE) CUCUMBER, the finest variety in cultivation, packets containing 12 seeds 1*s.* 6*d.*

Also the following esteemed varieties of CUCUMBERS and MELONS, in packets containing 12 seeds, at 1*s.* each:—

CUCUMBERS.	MELONS.
Henderson's Black Spine.	Victory of Bath.
Improved Patrick.	Beechwood.
Walker's Long Rambler.	Bromham Hall.
Manchester Prize.	Canteloupe.
Hunter's Prolific.	Duke of Bedford.
Superlative Improved.	Golden Perfection (extra fine).
Cuthill's Black Spine.	Scarlet Flesh (Anderson's).

Ohio Squasha Custard Gourd, 6*d.* ... ... per packet.
Antirrhinum, from named flowers, 6*d.* ... "
Calceolaria, from fine varieties, 1*s.* 6*d.* and 2*s.* 6*d.* "
Hollyhock, from fine named varieties, 1*s.* 6*d.* and 2*s.* 6*d.* "
Lilium giganteum, the most distinct and noble species of the genus, packets containing 20 seeds, 2*s.* 6*d.*

*** A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

UNEQUALLED NEW MELON, GOLDEN DROP GREEN FLESH.

EDWARD TILEY having purchased the whole of Messrs. Wood & Son's stock of Seeds of the above-named Melon, can with confidence recommend it to all growers of that splendid fruit. It has been thoroughly proved by an eminent Melon grower, and declared by all who have seen and tasted it to be one of the finest-flavoured Melons yet grown. It is a very beautiful colour when ripe, skin very thin, flesh firm and solid, and of a most superior melting and delicious flavour. Free setter and prolific bearer. It possesses a great advantage over others in its exceedingly handsome appearance when placed upon a table or on the stall of a fruit salesmen, and for exhibition this Melon will be the favourite.

THE KING, Superb Scarlet Flesh Melon.—This is a variety very much wanted, and which has for some time past been neglected, but is now becoming in great request; such being the case, EDWARD TILEY has just procured a stock of this most superb Hybrid Scarlet Flesh Melon, which he can recommend with as great confidence as those before sent out by him, and which have all given the greatest satisfaction to the public.

Each of the above varieties may be had in packets containing six seeds, 1*s.* 6*d.* per packet.

The following fine varieties of Melons can be highly recommended, and are all warranted true:—

The Queen	1*s.*	Beechwood	1*s.*
Bromham Hall	1*s.*	Windsor Prize	1*s.*
Incomparable	1*s.*	Emperor	1*s.*
Golden Ball...	1*s.*	Fleming's Hybrid Persian	1*s.*
Golden Perfection... ...	1*s.*	Blackall's Green Flesh ...	1*s.*
Bowood	1*s.*	Bailey's ditto ...	1*s.*
Victory of Bath	1*s.*	Snow's Hybrid	1*s.*
Camerton Court	1*s.*	Gordon Castle	1*s.*
Chichester Prize	1*s.*		

A packet of the Golden Drop and one of the King Melon, and one packet of any other variety mentioned will be forwarded, post free, on receipt of 3*s.* 6*d.* in cash or penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman and Florist, 14, Abbey Church Yard, Bath, Somerset.

NOW READY.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready, and should be ordered forthwith, by which a full supply of every kind of Vegetable Seed required during the whole year will be secured (including the best sorts yet introduced), and at a very small cost, viz.:—*

No. 1 Collection ...	£3 0 0	No. 3 Collection ...	£1 5 0
No. 2 do. ...	2 0 0	No. 4 do. ...	0 15 0

The quantities in each collection being apportioned to the size of the garden, INSTRUCTIONS ON CULTIVATION will be enclosed with Nos. 1, 2, and 3. To secure the best sorts, orders should be given immediately, addressed

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SUTTON'S COMPLETE COLLECTIONS, CARRIAGE FREE.

PARTICULARS OF THE SORTS AND QUANTITIES CONTAINED IN SUTTON'S COLLECTIONS OF SEEDS will be SEEN AT PAGE 50 OF "GARDENERS' CHRONICLE" FOR JANUARY 27.

By the perusal of this List, it will be seen that the very best kinds of Vegetable Seeds may be obtained in full quantities, and proper proportions for one year's supply of a large garden for the sum of 3l., and other complete Collections of equally choice sorts for smaller Gardens at 2l., 1l. 5s., and 15s. The economy of cost is by no means the only advantage gained by ordering one of these Collections.

Address, JOHN SUTTON & SONS, Seed Growers, Reading.

RENDLE'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS *are now ready. They can be had to suit various sized Gardens at the following prices:—*

No. 1 COLLECTION	£3 0 0
" 2 "	2 0 0
" 3 "	1 5 0
" 4 "	0 15 0

The quantities are fully detailed in their "Price Current and Garden Directory," a new edition of which is just published.

WILLIAM E. RENDLE & CO., Seed Growers, Plymouth.
ESTABLISHED 68 YEARS.

HOLCUS SACCHARATUS, OR CHINESE SUGAR CANE.—*For a full description, see the leading article in the* GARDENERS' CHRONICLE, *by Professor Lindley, page* 35, *January* 20, 1855.

WILLIAM E. RENDLE & CO., Seed Merchants, have just imported from France an excellent parcel of Seeds, which will be sold in sealed packets at 1*s.* and 2*s.* 6*d.* each, post free.—Apply to WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

DIOSCOREA BATATAS—THE NEW CHINESE POTATO.—This new esculent was fully described by Professor Lindley in the *Chronicle* of December 23, 1854.

The Subscribers are now importing a choice lot of Roots, and can supply them on the following terms:—

Four Tubers	£0 10 0	Fifty Tubers	£5 5 0
Ten "	1 2 6	Hundred "	10 0 0

First Orders will have the best Roots.—Apply to
WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 3, 1855.

MEETINGS FOR THE ENSUING WEEK.
TUESDAY, Feb. 6—Horticultural ..... 2 P.M.

WHETHER or not Rhododendrons, when grafted, are likely to be long-lived and healthy, is one of those questions which have to be determined upon general principles, as well as upon facts, or what are called by that name.

"A detached portion of a plant is not merely capable of producing the organs necessary to the formation of a perfect plant, but it has also the property of being able to blend with another plant, and lead a common life with it. On this capability depend the numerous garden operations which are known under the not very apt name of ennobling (*veredeln*, grafting). The contact of young succulent parts, which are in the course of development, is a necessary condition of this blending. Such a condition is very easily brought about in dicotyledonous plants, because in them there exists between the bark and wood that layer of young tissue in course of development called *cambium*; and there is little difficulty in so bringing together two plants, that this layer in each shall meet at some one point. But in the monocotyledons, in which the vascular bundles lie scattered through the whole stem, and no definite cambium layer exists, the conditions are far more unfavourable. It is true, according to DE CANDOLLE'S account, that BAUMANN, of Bollwiller, succeeded in grafting *Dracæna ferrea* on *D. terminalis*; but the scion died after the first year. The experiments, indeed, of CALDRINI on grafting Grasses had a more favourable result, for he succeeded in grafting even species of different genera, such as Rice upon *Panicum crus galli*. This result may be explained by the fact that in Grasses the lower part of the internodes enclosed in the leaf-sheath remains for a long time soft and succulent. A second and indispensable condition in grafting is a great similarity of the stock and scion; they must not only be nearly allied botanically, but be much alike in the composition of their sap. Yet although the possibility of grafting plants upon each other depends, in general, upon their close natural relationship, still many anomalies occur. In most cases different species of the same genus may be grafted on each other, or even in some instances species of nearly-allied genera, as, for example, Pears on Quinces, or White Thorn (*Cratægus oxyacantha*), or the snowy Mespil (*Amelanchier vulgaris*), while the common Lilac takes on the Ash tree and *Phillyrea latifolia*, the Olive on the Ash tree, and the Spanish

Chestnut on the Oak. Nevertheless, on the other hand, no union, or at least no permanent union, can be secured, where there is a far closer botanical affinity, as, for example, between the sweet Chestnut and the Beech, or the Apple and the Pear."

To this effect writes Mohl in that admirable treatise of his on the cells of plants*, the best work on Vegetable Physiology in any language. We quote it because, although he merely states notorious facts, yet the manner of putting them may be new to some of our readers. Let us see how far it goes to settle the matter in dispute among our correspondents.

It is, we think, incontestable, that although two plants of different species may be made to form a mutual adhesion by the process of grafting, yet that such adhesions are seldom if ever permanent, or even advantageous to the vigour of the scion. It is only when varieties of the same species are worked on each other, that a perfectly sound and durable union is effected; and not always even then, as we see when a fast growing Apple tree is grafted upon a diminutive variety such as the Paradise. If the union is to be perfect and the double or grafted plant to be in all respects as healthy as either of its parents the two must grow at the same rate, must have their sap in action at the same instant of time, and the quality of their secretions, be they what they may, must be identical. This happens when Pear trees grow on Pear trees, or Apples on Apples of similar habits. It does not happen in the same degree where Pears are grafted on Quinces, or Peaches are budded on the varieties of Plum. For although we employ such stocks, and with advantage, it is expressly because there is so much difference in the constitution of the scion and stock as to diminish the rate of growth of the former; and although the Peach will live for many years on a Plum, yet all gardeners know how great is their tendency to separate. In fact, if an old Peach tree worked on a Plum stock be allowed to dry, and is then so placed horizontally that the joint (of graft and stock) rests without support between two upright posts, and then receives a violent blow, the stock and scion will come asunder, as if no organic union had ever been effected. Had the Peach been worked on the Peach under equally favourable conditions, no such fracture would be practicable.

Wherever we look we are met with evidence to this fact. A man may graft a Cherry on a common Laurel, a Cedar of Lebanon on a Larch, or a China Rose upon a Dog-rose, and we all know that *saleable* plants are thus manufactured. But it will soon cease to be worth the while of the trade to form such plants, seeing that buyers now generally learn that they are merely ephemeral curiosities. If any one doubts this let him inquire how many of the thousands of worked Conifers which have come into the market within the last 20 years are still alive. It would turn out, we have little doubt, that the only healthy specimens now discoverable are those of varieties of the same species, or closely allied species, worked on each other, as for instance the yellow-berried Yew on the common Yew, or the Deodar on the Cedar of Lebanon. Is the Rhododendron an exception to the universal law? We think not. When a variety of Rhododendron *ponticum* is worked on the wild *ponticum* it finds itself at home and grows as well and is probably just as long lived as if it were "on its own bottom." But this does not appear to be the case when the varieties of *catawbiense* are put upon *ponticum*, or of *arboreum* and its allies on some European or North American stock. In saying this, we would by no means assert that very fine specimens of tree Rhododendrons may not be produced by grafting *catawbiense* on some other stock; but we certainly cannot admit that they are ever so handsome or so durable as if they found themselves on their own stock; and this is what we understand our correspondent "J. R." to contend for. It is not the mere act of grafting that is objected to, but that of grafting upon stocks of another species; and if this is so, all the remarks of Mr. Pearson become irrelevant.

In fact one of our practical correspondents who advocates the cause of grafted Rhododendrons, virtually gives up his case when he contends that the scion roots so quickly into the ground, provided the graft is low enough, that it soon acquires an independent existence. When that happens the plant is no longer grafted, but gets upon its own roots.

It is alleged that Sikkim Rhododendrons grafted on *ponticum* immediately form strong shoots, while the seedlings of the same species on their own roots remain weak. No doubt such is the fact. But the question at issue is not whether plants will "take," but whether they will "stand," to use the language of gardening; and if they do stand, whether they will retain their vigour when old. It may indeed be asked, and very fairly, whether that would be any advantage in gardening. Perhaps not; perhaps it is more desirable to have a somewhat stunted plant which flowers profusely, rather than a vigorous plant with more copious foliage. Such a case would be parallel with that of the Peach and its Plum stock. But we do not understand that to be the point under discussion, any more than whether it is possible for the nurseryman to supply his customers if he is to trust to so slow a process as layering.

Upon the whole it seems to be a safe conclusion that Rhododendrons are like other plants; that, where suitable stocks can be found, there is no good reason why they should not be grafted; and that, when stocks are unsuitable, the same bad consequences attend the operation as in other cases. Grafted plants may be as good or better for garden purposes than any others, or they may be much worse; all depends upon the stock.

* Principles of the Anatomy and Physiology of the Vegetable cell; translated by Henfrey. 8vo. Van Voorst. 1852.

What is meant by the term "double digging?" and what is it worth an acre? This would seem to be a simple question, and yet when the inquiry is raised it proves to be surrounded by as much mystery as the authorship of Junius. In Northamptonshire it appears, when the subsoil is unbroken, to consist of two shallow spits, each about 5 inches deep, or one 4 inches, and the other 6; after the subsoil is rendered loose by gradual breaking up year after year, the double digging becomes deeper till at last the soil is turned over to the depth of 20 or even 24 inches. For this the sum of 3*l.* is paid per acre. On the other hand, in Hertfordshire, the expression is applied to digging 20 inches deep at once, and breaking up the bottom, for which 10*l.* an acre is paid the first time and 8*l.* afterwards. Here we find an enormous difference in the meaning of the expression. A Gloucestershire correspondent says upon this subject:—

"I used to cultivate a plot of ground—20 acres—wholly by the spade. It was for the most part what would be called an adhesive loam. I could get it worked over 2 to 3 inches deep with the Teazel spade, a long, light, narrow tool, used by the hands without the foot, for 1*d.* per perch. The ordinary digging by spade cost 2*d.* per perch: this would be probably 7 inches deep. And with the 'grafting tool,'—a long, straight, narrow spade working 10 inches deep—the digging cost 3*d.* per perch. Trenching or double digging was done by two men, or man and boy; a trench, 3 feet wide, was taken out by the spade some 6 to 7 inches deep, and the earth carted to the side of the field where the digging would end. A man worked in the trench digging the subsoil over 10 inches deep with the grafting tool, taking the full width of 3 feet, and working from end to end of the trench. A lad dug the top-soil of the next 3 feet division with the common spade, throwing the whole of the earth so moved on to the top of the dug subsoil, and so opening a new trench for the man. The lad received 3*d.*, and the man 5*d.* a perch for his work; the former earned 1*s.* 6*d.*, and the latter 2*s.* 6*d.* a day. Wages generally were 2*s.* a day."

In this instance the double digging cost 5*l.* 6*s.* 8*d.* an acre; but it was neither the double digging of Northamptonshire nor Hertfordshire. The importance of the question before us is thus manifest, for it is applied in three different ways in three different counties, and the respective values of the expression are as 3*l.*, 8*l.* or 10*l.*, and 5*l.* 6*s.* 8*d.*

The cost of spade husbandry must necessarily be considered the first element in any calculation of its economical value; and it is obvious, from what has been said, that such cost is very far from being represented by terms in common use. The language of digging is almost as vague as that of mensuration, which calls "rod" the 160th part of an acre in one county and the fourth in another. Let us see if there is no means of reducing the facts into better order.

There are six kinds of digging generally practised, and no more. These are—

1. *Turning in*, or *flat digging*, which is merely turning over the surface by an oblique thrust of the spade, so as to bury weeds, and to level the surface. This may be taken as 4 inches.

2. *Digging*, properly so called, or one spit digging, in which the spade is forced into the ground nearly perpendicularly, so as to break up the soil to 9 or 10 inches.

3. *Bastard trenching* is the same as the last, except that the bottom "crumb" is thrown forward as well as broken up. Depth, 10 inches.

4. *Two spit digging*, when one spit is cast forward and the next merely forked up. This is sometimes called double digging near London.

5. *Two spit trenching*, namely 2 spits and a crumb, or 20 inches, also called double digging.

6. *Three spit trenching*, or 30 inches and a crumb.

Of these numbers 3, 4 and 5 are each called double digging in the neighbourhood of London. When an attempt is made to ascertain what each costs or ought to cost, there seems to be as much difference of opinion as there is in the names of the operation. Upon this point we have questioned some of the great London gardeners as well as their labourers; and the result is given in the following table, in which A represents Northamptonshire, B Hertfordshire, C Gloucestershire, and D to N our London informants.

1. *Turning in.*—C, 1*l.* 6*s.* 8*d.*

2. *Digging.*—B, C, E, H, K, L, M, N, 2*l.*; D, 1*l.* 6*s.* 8*d.*; I, 1*l.* 13*s.* 4*d.*

3. *Bastard trenching.*—A, 3*l.*; I, 2*l.* to 2*l.* 13*s.* 4*d.*

4. *Two spit digging.*—I, 2*l.* to 2*l.* 13*s.* 4*d.*

5. *Two spit trenching.*—A, 3*l.*; B, 8*l.* to 10*l.*; C, 5*l.* 6*s.* 8*d.*; D, 4*l.* 13*s.* 4*d.*; E, 6*l.*; F, H, K, 4*l.*; M, 4*l.* 13*s.* 4*d.* to 5*l.* 6*s.* 8*d.*

6. *Three spit trenching.*—D and N, 11*l.* 6*s.* 8*d.*; E, 10*l.*; H, 6*l.*

These enormous discrepancies in one of the most familiar operations in husbandry, show how little accord there is in even the same parts of the country in settling the mode of executing work, or naming the varieties of work, or paying for it. No doubt some difference arises from the nature of land, and some from the price of labour; but that explanation is evidently insufficient when it is recollected that all the letters from D to N apply to the well-worked friable land lying on the west of London.

Would it not be worth our correspondents' while to enable us to compile a large table of prices by communicating to us the rates they pay according to the six modes above described, pointing out the soil which is worked, and the county in which it lies. We would willingly undertake the labour of condensing and arranging such returns, in the belief that they would prove of very great general benefit. At all events until they shall have been collected all our calculations respecting the true cost of spade husbandry must remain in inextricable confusion.

New Plants.

112. Geonoma corallifera. *Hooker, Bot. Mag.*, t. 4831.

It is to be hoped that the public taste is so far improved as to be content to take more pleasure in beautiful forms than in merely brilliant colours. If that really be so, it may be expected that the smaller races of Palms, the most graceful of all plants, will become more common in gardens, and that the lumpish forms of so many of our favourite greenhouse shrubs will be diversified by the perpendicular stems and narrow bright green foliage of plants like this. Sir W. Hooker speaks of that now mentioned in the following terms:—"The little Palm before us was received from the Jardin des Plantes, of Paris, without any locality being given. It does not appear to exceed, if it equals, the height of a man; attracts attention by the rich, coral-like, simple, thick, and fleshy spadices, almost a foot long,—while young, green indeed, but then studded with the red female flowers, placed at considerable distances from each other. It is evidently a *Geonoma*, a graceful genus of small reed-stemmed Palms, peculiar to the tropical parts of South America, of which upwards of thirty species are described by authors."

VEGETABLE PATHOLOGY.—No. LVII.

258. Sterility. — *Accidental and Organic.* — The stigmatic surface or tissue may, however, be more or less injured by outward agents. Its peculiar secretion which favours the development of the pollen tubes may be washed off by constant rain; it may be dried up by sudden heat succeeding a low temperature, as after a thick fog;* or the tissue itself may be destroyed by frost, or decay prematurely by reason of ungenial conditions of the atmosphere. The tissue may be affected either before or after impregnation; but in either case the consequence is equally, though not so immediately fatal. The injury again may take place either before or after the expansion of the blossom. In springs such as we have experienced for some years the pistils of Pears, for example, are often affected before the blossom expands, the cold being sufficient to destroy their delicate tissue, though it does not immediately affect the vitality of the envelopes. In these cases the styles on the expansion of the blossom present a dark brown or black tint, which extends frequently to the base. The dark tint is not, however, confined to the style, but penetrates into the internal tissues. The centre of the placental column is more faintly tinged, and even the ovules themselves, probably from the

* It is asserted in a late article in the "Household Words," which must have been written by some one acquainted with the French vineyards that the disease called by the French coulure, the abortion and dropping off of the blossom, is thus induced; and this agrees with the statement of Ré on the subject. The word, however, is applied, as the word blight in England, to more diseases than one. It often indicates a premature falling or desiccation of the fruit, analogous to that which takes place in the process of stoning in Plums, Apricots, &c. The phrase quoted in the "Dictionary of the Academy" refers to this second malady, "La vigne est sauvée de la gelée, il n'y a plus que la coulée à craindre." The fall of flowers and fruit may alike arise from many different causes.

rapid imbibition of putrefactive matter from the sphacelated parts above, and the consequent destruction of vitality. At this stage the walls of the ovary are nearly of their normal tinge; but in a few hours, together with the stem, it becomes yellow, and separates from the common panicle. In a few instances the fruit itself begins to swell, but probably, in those cases only where the stigma or style has been affected after impregnation. The stamens in the same blossoms are often perfect and produce pollen, but sometimes like the styles, though more rarely, they become black.* A few blossoms occur, which are almost blind with the exception of rudimentary styles; but these suffer equally with the others.

259. It is probable that a far greater degree of frost is, in general, requisite to injure the male than the female organs. It is very possible, however, after the anthers and their pollen may have escaped all injury from frost, that excessive moisture, even though it may not affect the stigmatic tissue, may render the pollen grains effete. In general, the moisture secreted by the stigma is quite sufficient for the development of the pollen tubes, and in some cases they travel so slowly that an injury to the upper portion of the style is not necessarily fatal, provided no contagion from the dead matter take place; but if the moisture is excessive, the grains may burst either before or after they reach the stigma, and in consequence no pollen tubes can be emitted. As, however, pollen grains will germinate between two slips of glass, as proved by Reissek, if immersed in water, or in other situations than the stigma, this cause of evil may not be so powerful as might at first sight be expected.

260. Sterility is sometimes ascribed to the blasting of lightning, but this, like other general effects of electricity is very doubtful. The violent rain with which thunderstorms are usually accompanied may be injurious, and may sometimes account for the evil effects attributed to the lightning.

261. Fungi again may have a direct influence on fertility by attacking the organs of fructification. Some, as Microbotryon, infest the male organs, but a far greater number the female, to which they are more or less pernicious, according to the stage of progress at which they have arrived. Ergoted seeds, for instance, are sometimes only partially affected, insomuch that they are capable of germination. Such cases are figured by Tulasne in his memoir on Ergot, but we are not aware whether the seedlings have ever arrived at perfection.

262. Insects may produce sterility either by the direct destruction of the flowers or their constituents, or by the deposit of eggs in their tissues causing a hypertrophy of particular parts at the expense of the ultimate fertility; or without any hypertrophy, as in the case of the Curculio of the Hazel nut, and many other instances, by feeding on the fruit. In many cases the balance between the supply and demand of food is so nice that at the moment of perfection of the larva the seed is perfectly destroyed. In other cases, however, as in those weavels which attack Beans and Peas the seeds may be capable of germination provided the radicle and plumule be uninjured. The seedlings, however, which arise from such seeds will be proportionally weak, and will not ultimately succeed if there is not a plentiful supply of nutriment from without.

263. As the sarcocarp may be developed though no seed arrive at perfection, so the seeds may be matured while the sarcocarp is dwindled, as in more than one disease with which Grapes are affected. Such cases, though as disastrous as perfect sterility to the cultivator, belong to a different head, under which they will be severally treated. *M. J. B.*

COMMON THINGS.

Camellias.—Any person possessing a sufficient stock of these favourite plants, and the necessary accommodation, may have a supply of blossoms from August to May. To secure this, it is necessary to place a portion of the plants in a growing temperature of 60° or 65° in January, or early in February, and others at intervals of a month or six weeks, leaving the latest portion to make wood and set flower buds in a cool-house; it may, however, be necessary to remove the late plants to a higher temperature, to induce them to form flower buds; but, except in the case of very vigorous young plants, this will hardly be required. The Camellia is somewhat easily injured by the direct rays of the sun while in a growing state; it enjoys a shady situation, under Vines for instance. The plants should be freely supplied with weak manure water at all seasons, and especially while growing, and they will be benefited by frequent syringings. As soon as they have made their wood and formed their flower buds, they must be removed to a cooler situation, and, as soon as the weather will permit, may be placed in a sheltered shady place out of doors. The plants which were placed in heat in January or February will probably be in flower in August, but if not, they may be removed to a warmer atmosphere, to encourage them to develope their buds.

Rhododendrons as Standards. — To have standard Rhododendrons on their own roots, take them from the seed bed and plant them about 8 inches apart, where they should be permitted to remain for three or four years without thinning. When the plants are from 4 to 5 feet high, all the side shoots should be pinched off, which should be done constantly till they have attained the desired height, when the head may be allowed to form. If they are planted in good bog mould, they will make strong stems at this age, have a neat appearance, and flower as freely as when grown in the shape of low bushes. Four-feet stems are high enough, for when taller the plants are apt to be injured by wind.

Achimenes and Gesneras.—These should now be started into growth. The Achimenes should be planted in shallow pans in light sandy soil, covering them very lightly so as to allow of their being separated when fairly started with the least possible injury. Where these plants are grown largely and in a long succession, such as have been the longest at rest should be selected for early work. A few tubers of Gesnera zebrina for early flowering may also now be potted. These should be started singly in small pots.

* This exactly agrees with the account given by Ré, who is always worthy of attention where he observes for himself.

COTTAGERS' COMFORTS.

Seeing my gardener lying uncomfortably on three chairs ill, I thought how much more easy was the old settle, now only found in country inns. I have had two made of Elm, of which I send drawings and plan. If the labourers, or even farmers, had the choice, they would and do prefer the vulgar, dear, and (in draughty cottages) not nearly so comfortable sofa. The two uprights and the seat (which pro-

jects 3 inches beyond them) are of 1½-inch Elm, the back is of ½-inch Elm, with coverings to the joints to exclude draught, and reaches to the ground. The seat is let quite through the uprights, and is "pinned" on

the other side, which plan gives the settle great strength, and does away with any other framing. It is a perfect invalid labourer's couch. *Somerset.*

VEGETATION AND CLIMATES OF FOREIGN COUNTRIES.—No. II.

Nice, *Jan.* 26, 1855.—During the last fortnight some unusually cold weather has been experienced here, which has much checked the progress of vegetation, so there will not be anything material to report on that head. I also see by the newspapers that there has been severe frost in England, and it may be interesting to trace the progress of the late general decrease of temperature in most parts of Europe. From the various foreign papers which I see here I have taken the following information:—

	Jan. 17		18		19		20		21		22	
	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.
Paris	24	19	14	10	15	11	15	10	16	13	28	20
Brussels ...	31	17	...	...	21	12	20	14	...	...	28	18
Lyons, 7 a.m.	...	...	...	25	...	17	...	17	...	11	...	17
Nice	43	39	44	39	44	41	42	28	36	30	48	26

The French keep their register per centigrade. I have altered mine to Fahrenheit.

At Strasburg on the 17th the thermometer was down to 14°, and on the 19th to 13°; at Nantes on the 20th, to 14°; at Havre on the 19th, to 14°, and on the 20th, to 10°; at Rouen on the 19th the max. was 14°, and min., 10°. But the lowest temperature in France was in the department of the Yonne, where on the 19th it was down to 5°, or 27° below freezing; and at Auxerre on the 18th, to 4°; at Orleans, to 12°.

The fall of snow appears to have been very general on the 21st (Sunday) at Paris, Lyons, Marseilles, &c., nearly a foot in depth. The French mail was much delayed in consequence. No letters or papers were received here on Sunday, Monday, or Tuesday. The decrease of temperature at Nice was preceded by a violent storm, which raised the sea to a great height, and did much damage to the roads, and also to many of the fishing boats.

The Ferns found here are in nearly full foliage, comprising the Adiantum Capillus Veneris, which is very abundant, and in some places the fronds are from 18 to 20 inches in length. Ceterach officinarum is also very abundant. Polypodium vulgare and a serrulated variety, Adiantum nigrum, Scolopendrium vulgare, Asplenium Trichomanes, Ruta muraria, and Pteris cretica; the two latter rarely to be met with.

There are several sorts of Palm trees, many of them very fine specimens, more than 20 feet high. One of them, a Date Palm, has two immense hanging bunches of fruit, and is a splendid object. There are also some trees of the Asclepias in full flower; and a purple Polygala 8 feet high, likewise in full blossom: all in the open air. The recent frosts do not seem to affect them so much as they would in England, on account of the peculiar dryness of the atmosphere; and from this cause damp is seldom seen on the windows in the morning. The Acacia tomentosa has been looking very handsome, with its large bright yellow blossoms. The Tuberoses are now over; until recently good-sized bunches of them might be purchased for 6*d.* I yesterday saw a large bouquet, beautifully made up, consisting of an outer border of double Neapolitan Violets, then a circle of eight white Camellias mixed with the white Aspique, then an inner circle of Violets with a red Camellia in the centre.

One of the many handsome Evergreen trees in the vicinity is the Carob or Carrubia, some very large. Its leaf resembles our Acacia, but is thicker. It bears a long pod, with Beans something like the Scarlet Runner, which is very sweet and much esteemed by the mules and donkies, which are kept here in great numbers.

The following is the account of the Thermometer in the Shade since my last.

Persons who have been resident here many years, say they do not recollect so cold a week as the last has been.—*E. C.*

WELLINGTONIA GIGANTEA, OR THE GREAT TREE AND THE GREAT MAN.

The above was the title of a very interesting lecture, delivered on the 15th ult., by J. Bateman, Esq., M.A., F.R.S., of Biddulph Grange, in the Assembly Room, Congleton. The lecture was delivered in connection with the Congleton Mechanics' Institution, before a numerous and highly respectable audience.

Mr. Bateman commenced the lecture by observing that perhaps some present would be already acquainted with the extraordinary tree which had recently been discovered in North America, and to which had been given the name of a still more extraordinary man. The subject of the lecture might strike some as strange and curious, but he hoped that, as they proceeded, they would find that it opened out into interesting and profitable trains of thought. The arrangement of the lecture would be briefly this:—He should first give some information as to the district in which the Wellingtonia was discovered; then he should describe the tree itself, and afterwards make some allusions to the great man from whom the great tree had derived its name; and, in conclusion, offer some general reflections, which it would be seen that the subject naturally suggested. If they were to ask for a detailed description of the scene in which the subject of the lecture was laid, it would be requisite that he should refer to an atlas published within the last four or five years, as on the maps issued previously to that time, they would find the country described under the vague designation of "unknown." But how great a change had taken place within those few years! Where at t at time stretched a wild and unknown desert, now stood a magnificent city; and in the bay of San Francisco, which was then scarcely ruffled by the oars of a solitary canoe, now floated vessels from all countries. The magician that had waved his hand over the desert and the waters, and produced this fairy change, was gold. They would already have discovered that he alluded to California. (Loud applause.) The discovery of gold in California caused a great tide of emigration to set in that way, and, as might have been expected, a large proportion of those who immigrated from all countries were characters of the very worst description. Then followed those scenes of rapine, violence, and blood, the recital of which made Europe shudder; and what should have been the inauguration of the "golden age" more nearly resembled the breaking loose of hell. These scenes, he said, were occurring on one side of the great range of hills dividing the Californian coast from the inland territories of North America; and at the foot of the hills on the other side was going on a spectacle equally strange and deplorable. For on the other side of those hills lay Utah, the Great Salt Lake, around which swarmed a great Mormon population, under the rule of that licentious potentate, Mr. Brigham Young. He would not, however, dwell upon these painful scenes, but alike leave the Mammonites and the Mormonites, and turn to the calm and peaceful solitudes of primeval nature. (Loud applause.) Among the travellers who visited California when the gold discoveries began to attract the attention of Europe was Mr. Lobb, who travelled as the agent of the most enterprising nurserymen this country ever produced—he alluded to Messrs. Veitch of Exeter and London, who sent him out, not to carry away auriferous spoils from the country, but to examine into its vegetable productions. Mr. Lobb made numerous interesting discoveries, and after ascending the hills to a height

of above 300 feet, his eyes first rested on these monarchs of all trees, which were popularly named Wellingtonia Gigantea. They towered to a [illegible] stature, some among them rising to a height of [illegible] feet, or more than twice the height of the tallest factory chimney in Congleton, and with a proportionate girth, in some instances giving a circumference of 30 feet, and a diameter of 10 feet, thus capable of furnishing single planks of large size, which would be sufficient to floor that room. (Loud applause.) He (Mr. Bateman) was not of the opinion to think of bringing to this country an actual specimen of this monster tree, but Mr. Lobb had sent an accurate drawing of it, from which he (Mr. Bateman) had copied the diagram to which he then directed their attention. He now briefly explained a diagram representing a Wellingtonia 300 feet high and 3000 years old, which had been drawn on a scale of 1 foot to 10 yards. For the purpose of affording means for comparison, he had inserted in the drawing a ladder of a common length, leaning against the trunk, and a man ascending it. The gigantic size of the tree dwarfed the ladder to an appearance like that of a walking-stick, and the man half way upon it seemed about the size of a beetle. He had also drawn a Beech, Fir, and an Oak tree on the same scale; but, by comparison, they both sank into the appearance of insignificant shrubs; still, however, he said the eye had a difficulty in comprehending its astonishing dimensions, and he had adopted another means for comparison. He had drawn sketches of the tallest buildings in the world, selecting the Pyramids of Egypt, St. Peter's at Rome, Salisbury Cathedral, and St. Paul's at London. They would, however, see that the Wellingtonia left St. Paul's far behind; it was some feet higher than Salisbury Cathedral, the highest building in England; it contested the palm with St. Peter's and was but a small distance below the Pyramid. He then compared it with drawings of other trees, and, in comparison he said, the Palm tree appeared only like a Sugar Cane, the Spruce Fir like a Juniper, and even the famed Cedar of Lebanon only as a bush. To convey a more perfect idea of its astonishing size, he related several anecdotes concerning it. The method by which these trees were felled, he said, was to bore them through and through with immense augers, and then wait for a strong wind to complete the work. He described the great violence which attended the fall, and mentioned that on one occasion a traveller on horseback rode up in the trunk of one of the felled trees, to a distance of nearly a hundred yards. Some of the hollow trunks of these trees, he said, would have served for the smaller tubes of the Britannia Bridge, and here was a hint for railway contractors. If they wished to bridge over a stream, they had only to plant one of these trees on the bank, and, when it was full grown, fell it so as to reach across into the other side, and there would be a bridge already made. The only difficulty in the way was one which he would confess was rather a strong objection—that they would have to wait for 3000 years before the tree had matured itself, that being the period it occupied in attaining to its full growth. (Laughter and applause.) He then directed attention to a specimen of the bark of the Wellingtonia, which he produced, and which was of an astonishing thickness. He said it had a cocoa-fibre texture, and gave both a pungent smell. He related an amusing story of a clever practitioner in the land of Barnum, where he said there were men always ready to turn an honest or dishonest penny, who stripped one of these trees of its bark, and then joined the bark together and produced an actual representation of the Wellingtonia, and made a show of it in San Francisco, furnishing it inside with a pianoforte and carpets, and receiving parties in it. The interior of one of these trees, he said, would furnish an area large enough to contain all the wives of Mr. Brigham Young, and all the husbands of Lola Montes, who, by the way, was at present in San Francisco. (Laughter.) He then pointed attention to a diagram representing the lower portion of the trunk of a young Wellingtonia about 1000 years old! He proceeded to explain the general characteristics of the tree, and placed it as a distinct genus between the Pine and the Juniper, having the cone of the Pine, though proportionably smaller, and the foliage of the Juniper. It belonged, he said, to that most useful race to which we were indebted for Deal or Pine, and for masts for our shipping; which also furnished resin, pitch, turpentine, and many other useful articles. It was also stated that from the bark of this class of trees the wretched Russian serfs obtained a sort of bark bread, which, of necessity, must be a very disagreeable compound. And while on this topic, he would mention that a writer in the "Quarterly Review" says, that it is possible, by skilful manipulation, to manufacture a respectable loaf out of a deal board, and as it was well known that sawdust contained some grains of albumen, it was possible that, as the writer wittily remarked, "bread" and "board" might come to be synonymous terms. (Laughter.) The Wellingtonia, it would be seen, was valuable from considerations of utility, and, in addition, it was a magnificent ornament to the landscape. Considering the fitness of the name which had been given to this tree, he reminded the audience that figures of trees were often emblematically used in scripture to represent great or good men. He drew a distinction betwixt the senses in which the Palm and the Cedar were employed in the Bible, and read a lengthy passage in illustration from Ezekiel (chap. xxxi.) These authorities, he said, would justify the title of the lecture, although they destroyed all claims to originality on that point, when it was seen that, 25 centuries ago, Scriptural writers had compared the great tree with the great man. (Applause.) He then explained the method by which they arrived at the age of the Wellingtonia, by counting the number of concentric rings in the trunk, it having been ascertained that these rings were formed annually, and that each circle stood for a year. He explained in a very simple manner the process of restoration and growth taking place annually in the vegetable kingdom, by the circulation of the sap, which enabled them to arrive at the results above-mentioned. This, he said, related to what they might term "arboreal" time, by which nature regulated her proceedings in the vegetable world, and which was at times useful in checking the vagaries of antiquarians. He related an instance in which naturalists had been able to indicate the age of ruins in Central America, by ascertaining the period of their desertion by the age of the trees that had grown over their walls. To prove the correctness of the principle by which they thus measured the existence of trees, he produced a wedge cut out of a Scotch Fir tree, grown on the Knypersley estate, and, being able by the aid of other circumstances to fix the date when it was planted by a former occupant of the estate, he counted the concentric circles, and found that they exactly agreed with the number of years which had intervened. He then applied this reasoning in the case of the Wellingtonia, and by a diagram on which spaces were marked, representing each 100 rings, which he said were found to exist in the specimen on the scale of 25 rings to the inch, and by calculating the diameter they ascertained that the age of the tree could not be less than 3000 years. He observed to what a remote period of time the existence of one of these trees led them. Pointing to the wand with which he explained the diagrams, he said, when that tree was but the thickness of that wand, there occurred a siege which was then as important, and had since been as famous in history as would be the present siege of Sebastopol—he alluded to the memorable siege of Troy. (Applause.) He would however add, that he hoped it would not occupy Lord Raglan 10 years in reducing Sebastopol. (Renewed applause.) To turn to Scriptural history, they found that the tree began to live in the days of the Judges; it would be quite a youth in the time of David. At the period of our blessed Lord's incarnation it would be about 1200 years old, and it completed its second millennium during the dark ages of the Papacy. (Applause.) When it was about 2000 years old, a sad event, as far as concerned itself, occurred—viz., the discovery of America; for it was certain that when the enterprising Europeans set foot on the shores of the New World, the tree would not long remain "monarch of all it surveyed." That period was the most remarkable of preceding history. Then Constantinople was captured by the Turks, and artillery for the first time made an appliance of war. Also about that time the printing press was discovered, and soon followed by the circulation of Bibles, which led to the glorious Reformation. At the time of that event, in the 16th century, the tree would be in a green old age and so it continued until the 18th century, so remarkable in history, as being inimical to crowned heads, and then this monarch of the American woods fell before the axe of European aggression. (Loud applause.) But the tree was as yet without a name. They would be aware already, he remarked, that botanists frequently gave the names of princes, nobles, and great men to their discoveries. He mentioned several instances in illustration, and said that this had been carried out until for some time past there had scarcely been a family of note which had not furnished a name for some plant. But it strangely happened that in this particular the Great Duke had been omitted. But about the time that we lost our great man, the great tree was discovered; and a specimen was submitted to Professor Lindley, who, finding that it belonged to a new genus, proceeded to name it, selecting for that purpose the title of the great Duke. He read the dedication as made by the Professor, which concluded by saying that the most appropriate name for the greatest tree was the title of our greatest man, and, therefore, it should be henceforth known as Wellingtonia Gigantea. This was not the first occasion, he said, that Wellington and giant had been coupled together; and he amused the audience by reading a French nursery rhyme, done into English by Sir Walter Scott, with which, during the time of the Peninsular war, French nurses frightened refractory children into sleep, by telling them that "Giant Wellington might come that way," &c. He resumed: to become serious, he did not know if we should not have to go to war with America about this choice of name. He read an extract from an article in the *California Farmer*, in which Dr. Winslow, writing on this subject, complained vehemently of an English name having been given to an American tree, and characterised it as indicating scientific arrogance and indelicacy, to select the name of Wellington as that of the greatest of trees, when the name of Washington would have been in every way more suitable. (Laughter.) And the doctor, in magniloquent language, proposed that the name of the tree should be changed, and it should henceforth be called "Washingtonia Californica." He observed that both law and equity, however, were against the doctor—equity, because the Americans were at full liberty to have discovered the tree themselves, if they could, and to have named it after Washington, if they chose: and they were now at liberty to discover, if they could, a tree still more magnificent, and might designate that by the name of their great founder. (Laughter and renewed applause.) Botanical law was also against him, for it was a principle established by scientific men, for their own convenience, that, unless it could be shown that the discoverer was wrong as regarded the structure of a plant or tree, the name that he had given to it would continue to designate it to the end of time. He related some amusing instances, in which this circumstance had been made use of by botanists, for the gratification of envy, and otherwise. He would now proceed, he said, to speak briefly of the "great man" himself. He concluded this portion of the lecture by drawing a historical parallel betwixt Wellington and Cæsar; and after remarking that our Duke was as great a warrior, as good a writer, and as distinguished a statesman, he added that he was a nobler patriot, and gave the precedence to Wellington, in that Cæsar treacherously assumed the purple. He then proceeded to offer some general reflections which the progress of the subject had suggested. They had seen, he remarked, that the existence of two of these trees would span the whole period of recorded history. The progenitor of the tree represented before them would have been upwards of 6000 years old by this date; and, consequently, must have been contemporary with the placing of the first man upon the earth, and witnessed the world in its primeval beauty. The second tree had scarcely arrived at middle age when our Lord descended upon the earth, and pointing to a small specimen before him, scarcely the length of his finger, he asked what might be the fate of that plant. Already, as it were, the shadows of great coming events were falling around them. He concluded by a magnificent description of the new world which would succeed when the earth emerged from its fiery baptism, and from which not one human being need be excluded. He desired them not, like stiff-necked Israel in days of old, to think scorn of that pleasant land; and refuse to give credence unto the words of God. He concluded amid great and prolonged applause.

We beg to add that the diagrams, by which Mr. Bateman illustrated his lecture, were on a very large scale, and appeared to have been executed in a first-rate manner. *From the Staffordshire Sentinel, January* 20, 1855.

[These diagrams have been very obligingly sent to London by the ingenious and learned lecturer, and will be exhibited at the Horticultural Society's meeting on Tuesday next.]

Home Correspondence.

Sweet-scented Camellia (see p. 54).—Would your correspondent "Violet" inform me whether his sweet-scented Camellia is a single or double variety; if single it is no great novelty, as I have a seedling which has bloomed twice, and proved decidedly fragrant each time. To me the scent resemblesthat of a Wallflower, but not so strong, while others have compared it to a Hyacinth. It is a large single variety, and bloomed first three years ago. Being anxious to get a double kind possessing the same property, I impregnated it with double varieties and obtained seeds, plants from three of which bloomed last year at two years old. No. 1 was double, but it had no scent; No. 2 was single, and both in scent and shape resembled the parent; the 3d was single, but without any scent. Last year the mother plant bloomed again, but I was not fortunate enough to save any seed either from that or the young sweet-scented one, No. 2. It is full of buds this year, and appears to be a very free bloomer; but I shall not be satisfied till I get a good shaped double sweet-scented variety. If "Violet's" plant possesses these qualities, it is certainly a valuable acquisition. *John Hally, Blackheath.*

Datura Ceratocaulon.—The highly disciplined and artistic taste of the present time with regard to massing and arranging flowering plants in beds, according to the harmony of colours of their flowers, as well as the variegation of the foliage of the less showy flowering kinds, has excluded and comparatively thrown out of cultivation many of our perennial herbaceous plants, and also very many annuals, which formerly were universally grown. It is true so many good things have been introduced of late years through the instrumentality of the Horticultural Society in sending out collectors as well as through the spirited enterprise of private individuals in exploring the distant regions of the globe, that private cultivators are compelled to make a very moderate selection from the many new and interesting plants that we at present possess. But whilst I admit that Datura ceratocaulon has no peculiar claim to continued cultivation above many others which are now seldom seen, it is still worthy of the notice of those who may retain a border for the growth of mixed flowering plants alongside some favourite walk. The peculiar suitableness of this Datura for the situation consists in a certain grotesqueness of stem and branches, together with fine large funnel-shaped whitish flowers, which expand late in the afternoon, thus giving variety and cheerfulness to the evening walk, whilst those plants whose gay coloured flowers affect the sunlight are imperceptibly closing to repose. Complaint has been made of the difficulty in getting the seeds to vegetate. I have grown this plant many years, and have obtained a sufficient supply by letting it shed its seeds upon the ground in the autumn, and afterwards digging them in. The following spring when the weather set in warm many of the seeds vegetated, and when the plants were sufficiently strong they were transplanted with very little check. The seeds will lay in the ground and retain their vitality for several years; but I now would more particularly recommend them to be gathered as the seed-vessels burst. Let a flower-pot of sufficient depth and width be filled with garden soil to within 4 or 5 inches of the top, on which spread a thick layer of the seed; then fill the pot with the soil, place it in a cold frame and protect it from frost. About the beginning of April stir the soil in the pot so that many of the seeds may be within one inch of the surface. Place the pot in the shade in a house or frame, where there is a moderate growing heat. If in a frame, plunge the pot in the soil, and water sparingly. If after a month or six weeks no plants appear, plunge the pot to the rim in the open ground, there to remain until late in the autumn, to be again taken up and put in a frame, and in the spring following the same process must be repeated. When the plants come up they should be potted and treated as other tender annuals are, until such time as the weather permits their being planted out. If under these conditions no seeds vegetate, the failure I apprehend must be attributed to the seed not having been fertilised. *James Falconer.*

Cure for Fleas.—I have not noticed any exact reply to an inquiry that appeared in your pages some few weeks ago respecting some unknown plant reported to possess the power of destroying fleas. I have met with the following passage, which perhaps may satisfy the inquirer:—"Piré otou, an herb which is sold here (Erzeroum) in powder (Anthemis rosea or carnea), instantly kills fleas and other insects, and would be invaluable to travellers in warm weather." This passage occurs in Curzon's "Armenia." *Richard D. Ball, Heckfield Heath, Winchfield.* [The same is said of our Chrysanthemum leucanthemum, and other strong-scented Composite plants.]

Broccoli.—In a late number Mr. Sutton gives a list of seeds of this useful vegetable, by which we may have it from September till June, certainly quite long enough. Mr. Dixon and others mention theirs as being super-excellent in size, &c. What I want, being in the situation of many of your readers, viz., my own gardener, is a list of the best Broccolis, with the times to sow as well as reap, and I believe that any respectable nurseryman who would take the trouble of advertising packets of the really best kinds in succession at so much per set, with times of sowing, would find it answer well. *N. O. T.*

Grafted Rhododendrons.—The following remarks were penned before Messrs. Standish and Noble's paper at p. 53 was published, and do not consequently apply to them. The advocates of grafted Rhododendrons have one and all adopted what appears to me a curious line of defence, a species in fact of horticultural *alibi*, and a very Irish one, viz., that they are, in fact, not grafted, because they speedily establish themselves on their own roots. That is to say, that there is no real objection to a grafted Rhododendron, because, if you plant it properly, in a year or two it becomes a self-rooted plant. They, in fact, plead guilty to my indictment, and yet call upon your readers to say "no true bill." I think I need hardly waste more words on this point. It appears that a grafted Rhododendron is considered by its advocates a sort of provisional plant, a half-struck cutting, or half-rooted layer, which, if you understand it and treat it properly, will become all you desire. Now, I must confess when I buy plants I like them really rooted, and not provisionally, or at least to know what I am buying, and if I have only elucidated this point I think your readers will thank me for having raised the discussion. Mr. Fraser's remarks, however, raise so many questions of wider bearing, I must beg room for a few observations on them. In the first place, Mr. F. charges me with refuting myself, with "upsetting my own theory," because I state that the stocks of grafted Rhododendrons, though inadequate, in my opinion, to nourish the stronger growing species grafted on them, nevertheless throw up lateral shoots and suckers. His implied proposition appears to be that no stock grafted with a species more luxuriant than itself will produce suckers. The Plum when grafted or budded with the Apricot or Peach, the Paradise stock when grafted with a strong growing Apple, and many other examples, refute this suggestion. The stocks, though obviously of slower, smaller, and feebler growth than the grafts do continually throw up suckers, as every gardener knows. My statement is that plants having a natural tendency to throw out lateral shoots or suckers, continue to do so, though grafted with species more luxuriant than themselves. In other words, that grafting does not change the nature or habit of the stock, however much it may modify the graft, and I appeal to all vegetable physiologists to confirm or refute my state-

ment. Mr. Fraser further charges me with not having given sufficient proof that the stocks generally employed are deficient in strength, and a somewhat obscure passage follows, which, if I understand it aright, means to assert that the natural seedlings of R. ponticum and maximum are more luxuriant than cross-bred plants of the same species crossed with arboreum, and by inference I suppose that seedlings of ponticum and maximum are adequate stocks for the hybrids. Now, as far as my observation goes, the very reverse of this is the case—witness: R. arboreo-caucasicum (R. Russellianum), a plant three times as luxuriant as its dwarfish parent R. caucasicum and R. alta-clerense, more luxuriant than R. catawbiense. But Mr. Fraser makes a further assertion, which, if he is able to establish it, will add an important fact to our physiological knowledge, and disprove an opinion of the late Dean of Manchester, founded on 40 years' experience. Mr. Fraser states that hybrids exhibit almost invariably the character and habits of the female parent, and that hybrids between R. arboreum and catawbiense are not hardy unless the seed be saved from catawbiense, *i.e.*, unless the female be hardy. Mr. Herbert states (Hort. Soc. Journal, Vol. II., p. 98):—"Cross-bred vegetables seem to assimilate more to the male than to the female parent, though sometimes the reverse is the case;" and he adds—"As far as I have seen, a cross where the male is hardy and the female tender, is much more hardy than one where the female is hardy and the male tender. This is very important and conspicuous in cross-bred Rhododendrons." These remarks were written in 1846. What experiments have since been made to disprove this opinion?—and upon what facts does Mr. Fraser found his statement? Since Mr. Herbert's day we have few records of experiments on cross-breeding, and if Mr. Fraser can furnish any in confirmation or confutation of Mr. Herbert's opinions, he will do good service to vegetable physiology. I must not be tempted to diverge into the subject of grafting in general, though some of my critics challenge me to such a course. I will only remark, that with certain peculiar exceptions I never saw a plant yet that was not stunted by grafting, unless it be the yellow Horse Chesnut. The Copper Beech undoubtedly is, unless the disease which affects its colour affects also its growth, for who ever saw a Copper Beech as large and luxuriant as the common Beech, and, strange to say, where it does flourish more than usual, on soils where the Beech is native, it appears to have a tendency to lose its colour. I am asked whether I would cultivate the Peach on its own roots. Certainly I would, if I could obtain such plants; and, as the next resort, I would have them grafted or budded on the Almond, according to Mr. Knight's suggestion. I have no experience on this head, but the opinion of Mr. K., who, as a physiologist, gardener, and accurate observer has seldom been surpassed, will I think justify me in differing from some of my critics, and till they have disproved his theories, I am content to abide by them. *J. R.*

Frigi Domo injured by soaking in boiled oil.—In order to render it less liable to injury by the weather, I soaked a few yards of "Frigi Domo" in the boiled oil commonly used by house painters. When I examined it after three days' soaking, the outside folds of the cloth were little injured, but the inside was burnt almost to powder, forming a black charred mass without any coherence excepting in the parts nearest the outside, where on being opened, it fell into small, thin, dark flakes, still retaining their exact original shape. Can any of your readers explain the cause of this accident, and inform me at the same time whether boiled oil can be advantageously used in general for coating over cotton or hempen netting and cloth exposed during the spring on fruit walls? *A Subscriber, Birches Green, near Birmingham.*

Notices of Books.

Food and its Adulterations, &c. By A. H. Hassall, M.D. 8vo. Longmans (28*s.*).

For some three or four years the public mind has been excited by a series of articles in the medical journal called the *Lancet*, showing that almost every article of daily consumption is adulterated. The examination of substances was said by the editor, Mr. Wakley, the Coroner for Middlesex, to be placed in the hands of an "Analytical Sanitary Commission." The reports of this "Commission" were read and admired by the unlearned, who fancied they discovered in them a profundity of scientific knowledge. Every one asked who are the members of this Analytical Sanitary Commission? what are their means of information? and how far are their reports entitled to confidence? But although nobody avowed the authorship, it soon became evident that the members of the "Commission" must be only ordinary observers, and that although their statements were useful, and up to a certain point accurate, yet that they were open to suspicion as well as deficient in the kind of knowledge which was to be expected from "An Analytical Sanitary Commission."

We now learn that the only member of this "Commission" has been Dr. Arthur Hill Hassall, the writer of the book before us, previously known as the author of some indifferent works on microscopical subjects, and of a highly-coloured report upon the water furnished to London by the water companies. So that it appears there are no Commissioners at all in this matter, unless Dr. Hassall be taken to consist of several gentlemen rolled into one, and that the title given to his investigations in the *Lancet* was not altogether free from the imputation of misrepresentation; rather an awkward beginning for an inquiry into supposed frauds, for the detection of which great skill and knowledge were required, as well as a reputation upon which even uncharitable persons would not dare to breathe.

For about four years this "Analytical Sanitary Commission" has been terrifying the public, and bullying shopkeepers; the latter, we have no doubt, in many cases with very sufficient reason. The result is the bulky volume before us, consisting of 659 pages of closely-printed matter, and 159 woodcuts. Of their true value as a whole it is beyond our power to make anything like a complete report; we can only say that although there is no doubt about their general truth, yet that where we have followed them, as in the case of Coffee and Tobacco, they indicate but a slender knowledge of the subject; and that in other instances, that of water for example, they are extravagant exaggerations, not written in the spirit of fair inquiry, to say nothing of science, but for the purpose of astonishing those readers of the *Lancet* who do not know how to use a microscope, or who do not possess one.

Undoubtedly there is an enormous amount of fraud practised by the shopkeepers of this country, especially upon the poor, and it is a good work to expose their iniquity. Mr. Wakley, we will add, deserves our thanks for boldly publishing the names of the delinquents, always supposing they were so, and holding them up to reprobation; for it is practically useless in this country to charge any body of men with offences. General allegations are inoperative, and besides there is something cowardly in them; it is only when delinquents are personally exposed that the power of criticism is felt and recognised. But the power thus wielded is a terrible one; and it is doubtful whether it ought to be in the hands of unknown irresponsible persons, screened by such high-sounding names as that of the "Analytical Sanitary Commission of the *Lancet*," which turns out to be what our learned and gallant friends across the Channel would call a mystification; we shall not translate the word into English. Such power is very apt to be abused, accidentally if not intentionally, and, unless we are much misinformed, it actually has been by Dr. Hassall himself. But let that pass—all men are liable to error.

One would have imagined that the publication of these papers in the columns of a weekly paper would have been sufficient to give them publicity, especially when that paper is the *Lancet*, having a very large professional circulation. And we should have been at a loss to know what could have led to such crude memoranda being collected, with little or no abridgment, into a volume of between 600 and 700 pages, more than one-half of which is irrelevant matter, had we not read the preface and the dedication of the work to Sir Benjamin Hall, the new President of the newly constituted Board of Health. We now see that Dr. Hassall is of opinion that a standing "Analytical Sanitary Commission" ought to be appointed by Act of Parliament, and that that part of the duties of the Excise, which consists in prosecuting fraudulent dealers, should be transferred to the new "Analytical Sanitary Commission," which we suppose is to be again composed of several gentlemen rolled into one, who is (are) to relieve the most able and active Chairman of Inland Revenue of one of the most important and delicate parts of his administrative functions. In pronouncing upon the necessity of this great reform in our institutions, Dr. Hassall does not mince his words. On the contrary, he calls the Excise a clumsy and inefficient as well as expensive machine; describes the methods at present adopted by the Excise for detecting adulterations as unworthy of the scientific character of the times in which we live; and unhesitatingly asserts that it does not "sufficiently employ the resources of science for the discovery of adulteration. They rely too much," he adds, "upon the information of Excise inspectors, and too little upon science, upon the resources of chemistry, more particularly of organic chemistry, and especially upon a knowledge of vegetable structure as revealed to the competent observer by means of the microscope."

If the statements of the "Analytical Sanitary Commission" are not more consistent with fact than this, we can only say that a monstrous wrong has been done to the dealers gibbeted in the *Lancet*. So far from Dr. Hassall's reckless assertions being true, they are the very reverse of the truth. Not to mention the well-known very elaborate experiments upon malt, conducted for the Board of Excise by the late lamented Dr. Thomson, of Glasgow, or of the numerous cases which have been carried to so successful an issue by scientific witnesses that fraudulent dealers now rarely venture to resist Excise prosecution, we have at this moment before us an elaborate report upon a most important subject deeply affecting the public revenue, which report is signed:—

Dugald Campbell,	Jos. Dalton Hooker,
Wm. B. Carpenter,	John Lindley,
Thomas Graham,	John Stenhouse.

Does Dr. Hassall—we beg his pardon, does "The Analytical Sanitary Commission"—mean to say that these are names unknown in science? or does he proclaim that they do not move in the same orbit as himself? If that is the meaning of the ignorant calumny just quoted, we are ready to admit its truth; for we will undertake to say that not one of these gentlemen would endorse any one of the reports of the "Analytical Sanitary Commission."

But our learned and very disinterested author complains that the Excise rely too much upon their inspectors. Does he know who those inspectors are? or what their attainments? If not, we can inform him that they are able, active, and acute public officers; that they understand their duties; and that it is because of their intelligence and acuteness that scientific witnesses, —sometimes, we regret to say, untrustworthy witnesses—have been so little employed of late. We should like to see one of these most respectable officers placed in a witness box, and immediately succeeded there by the agent of the *Lancet*, if it were not that we should regret to see any man exposed to so humiliating a comparison.

Instead of thinking it wrong to employ the Excise inspectors in detecting fraud, we must take the liberty of saying that they are in every way preferable to such an irresponsible anonymous "Analytical Sanitary Commission" as the *Lancet* got up. We think, moreover, that the rule should be to rely upon their evidence, calling in such an expensive machinery as scientific assistance being the exception, to be applied only in difficult cases. Everybody who knows anything knows perfectly well that the Inland Revenue, of which the Excise is a branch, if not the best of all our public offices is at least second to none for honesty, activity, knowledge, and thoroughly good organisation. Its chairman is a man of perfect knowledge of the intricate duties of his department, and of a firmness in the administration of them only equalled by the courtesy which attends it—most important qualifications in an officer of Government called upon daily to enforce a very unpopular though necessary branch of law; and we presume to add, at the risk of hurting the susceptibilities of the "Analytical Sanitary Commission," that to publish a huge 8vo, with no other apparent aim than to persuade people to the contrary, is alike discreditable to the good sense and good feeling of the author.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—The large Lælia superbiens in the curvilinear stove is now in full bloom, and an extremely striking object it is, seven glorious flower-spikes with which it is furnished being all at one time in the greatest possible perfection. This fine plant has blossomed every winter for these last seven years, and therefore its flowering annually may henceforth be looked forward to with certainty. Those who wish to see it on this occasion should, however, lose no time in doing so, as it will soon begin to fade. It has already been in flower a fortnight The noble specimen of Dendrobium speciosum which bloomed so magnificently along with the above some two or three years ago, is again showing flower; but not near so finely as on that occasion. Angræcum virens, Barkeria Skinneri, and a few other Orchids, are also at present in blossom.

Inside Ewing's glass walls, Chinese Primroses planted out are now flowering as beautifully as they do in pots in ordinary greenhouses. The only protection they have had from the severity of the weather is the glass, which makes their situation 2° warmer than the open garden. It will thus be seen how hardy such plants are when they can be kept comparatively dry.

In the Rose house the plants have all been pruned; and, with a view to keep off mildew, they have been liberally dusted with sulphur, first damping the shoots and leaves to make it stick. The borders have also been forked up and put in order for the winter.

In the orchard house the raised beds on which the Roses grew before they were transferred to the Rose house, are now being levelled down and forked up preparatory to setting fruit trees in pots on them. Of the latter the Society has now a good collection, which this year is to have a fair trial in this house. Even Raspberries have been potted for the purpose of sharing in the experiment.

In the great conservatory the different Brugmansias are again covered, as they nearly always are, with their long, red, trumpet-shaped flowers; but of all the plants in this house, by far the greatest favourite, and justly so, is the Luculia gratissima, which is at present finely in blossom; and even in this cool-house the large clusters of delicate rose-coloured flowers which terminate nearly every shoot emit a fragrance which quite loads the air in their neighbourhood with sweetness. This is a plant which no conservatory bed should be without. All the care that it requires is merely to keep it clean, and every year to remove as much of the exhausted soil from the roots as possible without injuring or disturbing them, and to replace it with fresh material; but even this attention is only needed after the plant has stood for some years in the same place, and has begun to show symptoms of want of vigour. Its flowers being much prized for bouquets, subjects the plant to a regular annual pruning, which, however, seems rather to improve than injure it.

Chimonanthus fragrans and grandiflorus are at present in blossom on the conservative wall, where they are matted up to keep the flowers from being spoiled by exposure to the severity of the weather. The well known fragrance of the blossoms of this plant we need not say renders it quite worthy of this attention. On the same wall Jasminum nudiflorum is pushing forth a few of its round yellow flowers, but it is only under glass at this inclement season that they are developed in perfection; when this is afforded them they open in

sufficient numbers and so clear and beautiful as to produce a cheerful and even rather a striking effect.

In the orchard department, Pear trees on walls are being pruned, as are also open dwarfs in belts. Where loose bark has accumulated on the stems or limbs of the latter in sufficient quantity to offer a harbour for insects, it is being carefully scraped off, and the parts are to be dressed with the following composition, viz., half a peck of quick lime, half a pound of sulphur, and a quarter of a pound of lamp black mixed together with as much water as will form them into a thick paint. This mixture is recommended in "Lindley's Guide to the Orchard," to be applied in a warm state, or something more than blood heat. Some new varieties of Belgian Pears, received from M. De Jonghe, have been planted along the front of the Peach border, where they are to be trained as dwarf pyramids.

Woollen netting similar to that described and represented by a wood-cut a week or two ago, at p. 24, is being put in readiness for the protection of wall trees in spring.

With respect to the kitchen garden little can be said, as it is at present covered with snow. It is, however, very greatly improved, and we understand that special attention is to be paid in it this year to the proving and reporting on the qualities and peculiarities of all kinds of esculents. We therefore invite nurserymen and others to forward samples of their new seeds to the Society for trial, which they may be assured will be carefully made and faithfully reported. In this way, what is really meritorious will be distinguished from that which is not, and the result cannot fail to benefit all parties, as well as increase the usefulness of the Society. *In short the Trade has thus an opportunity of apprizing the public, upon authority above suspicion, what the value of their novelties really is.* We have no doubt they will avail themselves of it.

FLORICULTURE.

The Calceolaria.—Florists, and even gentlemen's gardeners, have lately evinced a disposition to throw the herbaceous kinds of Calceolarias out of cultivation, and to substitute for them shrubby sorts which are more easily managed, and against which I have not a word to say; but still I regret to see the other varieties, most of which are far handsomer than the shrubby kinds, so much neglected as they now are. I have therefore furnished the following remarks on their management, with the view of directing more attention to them than they have lately received. It is true they are somewhat difficult to winter, but nevertheless I feel certain that any one who will strictly carry out my plan of growing them need entertain no apprehensions of failure. Let us commence at the time they have done flowering, which is, under ordinary circumstances, about the latter end of June. As soon afterwards as circumstances will permit, divest them of their flower stalks and dead leaves, and top-dress them about an inch deep with silver sand and yellow loam in equal portions, taking care that all the ripe joints of the young shoots are covered for about half that depth; afterwards place them in a cool shady situation until the beginning or middle of September, giving occasional waterings during that period. By this time it will generally be found that most of the shoots so covered have emitted a sufficient number of roots to admit of their being removed with safety from the parent plant; this operation I perform in the same manner as is generally done by gardeners in the removing of layers of Carnations. I then plant them in 5-inch pots, or smaller if necessary, and place them in a frame on a gentle bottom heat of tan, taking care at this period to guard against the direct influence of the sun until they are fairly established in their pots. The compost I use for the first potting is, three parts of yellow loam, four of well decomposed leaf mould, one of cow dung, which has lain at least twelve months, and two of silver sand. This soil I vary as the plants strengthen and approach their flowering season, until the proportions are five of loam, two of leaf mould, two of cow dung, and one of silver sand. From the time the plants are well established in their pots I give them no particular attention beyond that of slightly fumigating them once a week, a routine to which I subject them during their whole period of growth, until about the beginning of January, when I shift them into larger pots and place them on the front stage of a Geranium house, the temperature of which is kept at 45° with an exceedingly humid atmosphere. I ought to observe, that in shifting I always sink the ball a little to admit of a top dressing of fresh mould being put over the ripe joints of the young wood, which very soon emit roots, an operation which tends materially to increase the size and strength of the plants. I am also very particular as to drainage, never allowing a particle of the old drainage to be removed; and by the time they are placed in their flowering pots, I have a complete open drain from within a few inches of the surface down to the bottom of the pot, with the exception of the layers of fresh turf, which I always introduce between the mould and potsherds. This temperature, and a careful attention to fumigation, I consider the most essential points in the cultivation of Calceolarias of this class; for if they once become infested by green fly, no art can prevent the disfigurement of their foliage, and few plants are more impatient of an excess of moisture at their roots than herbaceous Calceolarias are. It should be observed, however, that in fumigating, care must be taken to avoid doing so in excess; for if smoke is applied to them in the same quantity as would be proper for Peaches or other plants of a hardier nature, they will be certain to suffer from its effects. In watering, I am guided more by the appearance of their foliage than by the mould in the pots; if they are in a proper state, their foliage will be found every morning to be fringed with drops of dew, which is a certain indication of health. When this has not been the case, I have always found that my plants were either too wet or too dry. By using the above compost, attending to temperature and atmospheric moisture, avoiding an excess of water at their roots, and slightly fumigating once a week, I have grown many of the beautiful, but now old-fashioned, varieties, to the size of between 2 and 3 feet in diameter in the head of flowers. This, however, cannot be accomplished without following accurately the instructions just laid down, which I consider necessary to bring such plants to perfection. *S.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—In the present state of the weather a considerable amount of fire-heat will be necessary, the drying effects of which will be injurious to plants generally, and particularly those in bloom, unless counteracted by judiciously sprinkling the beds, &c. Do not, however, throw more moisture into the atmosphere than may be necessary to render it "sweet and healthy," for while fresh air cannot be admitted, any excess might be more injurious than the opposite extreme. Attend to maintaining a constant supply of flowers by introducing into gentle heat at short intervals proper quantities of the various plants suitable for forcing, as Rhododendrons, Azaleas, Kalmias, Deutzias, Dielytra spectabilis, Roses, Dutch Bulbs, &c., of all of which everybody who has a conservatory to keep gay in winter should have a good stock of well prepared plants. Large specimens of Clerodendrons, Allamandas, Vincas, Dipladenias, &c., that have fairly started into growth, should now be turned out of their pots, reducing the balls as much as can be done without very seriously injuring the roots, repotting them in the same sized pots, using rich soil. The plants should be placed in a mild bottom heat after repotting, and be very cautiously supplied with water at the root until they get into free growth. Afford them a thoroughly moist atmosphere, however, with an occasional sprinkling over head with a fine rosed syringe.

FLOWER GARDEN AND SHRUBBERIES.

Little can be done here in the present state of the weather beyond such operations as were referred to last week. Those who are fortunate enough to have the command of a gravel pit should get a good supply of this provided while the weather is unfavourable for most out-doors operations. Let everything in the shape of in-doors work, which can be done now to save time after the weather has improved, be attended to. See to having plenty of soil prepared for striking cuttings in, as also for potting off, and have plenty of draining materials prepared and sorted out in sizes. Where the stock of bedding out plants is short, the strongest stove plants should be selected and placed in a moist growing temperature, keeping them as near the glass as possible in order to secure strong growth and obtain good cuttings. If the plants are well rooted, it will be advisable to give them a shift, using rich soil; for it is of great importance to obtain strong cuttings, as they are not half the time becoming established plants as when weakly dwindling shoots have to be used for cuttings.

FORCING DEPARTMENT.

Vineries.—Discontinue syringing Vines that are showing fruit; but secure plenty of moisture in the atmosphere by frequently sprinkling the passages, &c. Be satisfied with as low a temperature as will be safe under the state of the Vines at night, and on cold cloudy days, but take advantage of sunshine to raise it considerably, and be cautious how cold air is admitted where the Vines are in leaf. As the Grapes are cleared from late houses, prune and wash the Vines with soft soap, and a little soot and lime, also thoroughly clean the woodwork, glass, &c., and have everything clean and ready for next campaign. Peach House.—Discontinue syringing where the blossoms are beginning to open, but secure a nice, moist, healthy state of the atmosphere by sprinkling the passages, &c., as may be necessary, but avoid anything like dampness while the trees are in bloom. Maintain a steady night temperature of 50° to 55° while the trees are in bloom. Take every possible opportunity of admitting fresh air, and where the external air can be made to pass over the heating apparatus, so as to get heated before coming in contact with the plants, a gentle circulation should be constantly kept up until the fruit is fairly set. Avoid the admission of currents of dry, cold air, however, which would be most injurious to the trees. Figs.—See that trees planted out are properly moist at the roots, and also keep those in pots and tubs carefully supplied with water, for any excess as respects the presence or absence of moisture at the root is very dangerous after the appearance of the fruit, and is the frequent cause of its dropping off. Maintain a moist atmosphere, and if necessary to water the border, use tepid water, giving enough to nicely moisten the whole of the soil. Let the temperature range from 50° or 55° at night to 60° or 65° by day, giving air whenever it can be done with perfect safety.

HARDY FRUIT AND KITCHEN GARDEN.

Where orchard trees are infested with insects, the bark should be well scraped with a blunt tool to remove as many of the larvæ of the insects as possible, after which the parts should receive a coat of the composition recommended in this paper last week, under the head of "Common Things," viz., hot lime and soot in equal quantities, mixed with cow's urine until it attains the consistency of thick paint. The composition should be well rubbed into the crevices of the bark, in order to make sure of its reaching every hiding place of the enemy, and if a little cow manure was worked up in the composition, it would be useful in causing it to adhere better. It is a tedious process to properly cover large old trees with this, but its effect in clearing them of insects will well repay the trouble, and an occasional coat to young trees will be useful in keeping them clear. The present weather is likely enough to destroy early sown Peas, and where this is apprehended, a quantity should be sown in strips of turf, and raised in a gentle heat, to be hardened off and planted out towards the end of the month. Also make a successional sowing of an early variety on a warm border as soon as the state of the weather permits. Daniel O'Rourke is the earliest variety we know. Likewise get in some early Mazagan Beans, and a sowing of some variety of Pea of good quality, as Champion of England, should be made in order to have these in as early as possible. Look over last week's directions, and push forward any out-doors work as fast as the weather will admit. See to having a bed prepared for forcing Potatoes, Radishes, &c., and put in a pinch of Lettuce, &c., in moderate heat to be hardened off, and planted out to succeed those that were raised in autumn.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Feb. 1, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 10th, 1831—therm. 65 deg.; and the lowest on the 9th, 1847—therm. 4 deg.

Notices to Correspondents.

Books: *J B.* We will inquire and give you our advice next week. You are very right to ask how you can lay your money out to the best advantage.—*Sub.* We never recommend dealers. Any respectable bookseller can procure "Roberts on the Vine" for you if he chooses.‡

Cucumber Roots: *H B.* Just received. Will be noticed next week.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*X A.* Bifrenaria Hadweni.—*W S H.* Unusual plants not in flower cannot be named.—*J A M.* Chimonanthus fragrans.

Pyramidal Pear Trees: *Sub.* If these are received from the nursery unpruned, which they ought not to be, as they should have their shoots shortened in August so as to require no pruning when planted, the side shoots should be shortened in February to within 6 or 9 inches of the stem, the latter for vigorous growing varieties, the leading shoot to 12 inches; the shortened side shoots will each of them put forth the first season of growth, say three or more shoots; all of these but one should be pinched early in July to the length of 2 inches, and one for a leading shoot to each side branch left to grow till the end of August, and then shortened to within 6 or 9 inches, according to the vigour of the tree. The shortened leading shoots of the tree will put forth from three to five shoots; these, all but one for the leader, must be pinched to within 6 inches early in July and the leader left to grow till the end of August, and then shortened to 10 or 12 inches. This, in as few words as possible, is the annual course of treatment. For a more detailed account, Mr. Rivers' pamphlet on the subject, advertised in another column, might be consulted with advantage. We may add that some varieties on the Quince stock form too many blossom buds; when this is the case thin them out in February with a sharp penknife.

Thermometers: *G C S.* Your thermometer tube should on no account be on metal, but on wood. For registration the common horizontal spirit thermometer, when well made, is the best. Don't hang the thermometer against any wall, but place it over Grass a foot from the ground, behind a screen which will keep off the sun by day, without interfering with radiation at night.

Vinery: *E.* Your bedding out plants will do no harm to your Vines so long as the latter are not forced into bud: but when that happens you will have to take out your bedding plants unless you have such a command of air as will prevent the latter being drawn up without injuring the tender leaves of the Vines.

White Blackberry: *S J.* We shall be glad to receive the cuttings you are so obliging as to offer.‡

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204A, Upper Thames Street, London.

CYANIC MANURE COMPANY.
WHITE'S PATENTS.
OFFICES, 37, CHARING CROSS, LONDON.
Directors.
The Hon. J. W. Fortescue. | General Macdonald, C.B.
G. P. Irvine, Esq. | Newton S. Scott, Esq.
Bankers—Messrs. Herries, Farquhar, & Co., St. James's Street.
Solicitors—Messrs. Vallance & Vallance, 20, Essex Street, Strand.
Agricultural Chemist—W. White, Esq.
Secretary—Mr. W. F. Mould.
Patent Cyanic Manure ... ... 8*l.* per ton.
" " Deodorising Powder ... 15*s.* per cwt.
" " Plant Preservative ... 12*s.* 6*d.* per cwt.
The Directors have the satisfaction of announcing that their arrangements will now enable them to execute orders to any extent. Applications for Agencies to be accompanied by references. Orders to be addressed to the Secretary, 37, Charing Cross, London.

WANTED, RESPECTABLE AGENTS for a MANURE, the character and wonderful results of which are so fully established by several hundreds of Testimonials, from all parts of the United Kingdom, as to command a sale for it.—Address, with occupation and references, A. R., 45, Fleet Street, London.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.
IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.
COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.
Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.
WARMING AND VENTILATING.

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.
NEWLY IMPROVED ECONOMIC STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.
Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35*s.* each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.
JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, a few doors east of the Pantheon.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.
MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.
Canonmills Bridge, Edinburgh.

WEEDS ON WALKS.
MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—MAW & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
John C. Cobbold, Esq., M.P. | William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S. | Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq. | Samuel Morton Peto, Esq.
Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute works of Drainage, Irrigation, Road-making, Enclosing, Reclaiming, and the Erection of Farm Buildings upon any Estates, under Settlement, Mortgage, or Disability, and without any investigation of Title, to charge the total amount of the outlay and expenses upon the property improved, to be repaid by annual instalments, varying according to the number of years over which Landowners may determine the repayment shall extend, within the limits of 31 years for Farm Buildings, and 50 years for Drainage, Roads, and other Improvements. Arrangements are also made with Landowners for the execution of the works by their own agents, and for the supply of the capital or repayment of their own advances, through the exercise of the Company's powers. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1855.—The Prize Lists for Stock, Domestic Poultry, and Roots, are now ready, and Copies may be obtained on application to JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham, February 3.

The Agricultural Gazette.

SATURDAY, FEBRUARY 3, 1855.

MEETINGS FOR THE ENSUING WEEK.
THURSDAY, Feb. 8—Agricultural Imp. Society of Ireland.

IN a useful and instructive article upon FIRES AND FIRE INSURANCES in the current number of the *Quarterly Review*, there is a paragraph or two on agricultural fires and incendiarism among farming stock. The information upon which the reviewer proceeds has been given to him principally by the manager of the County Fire Office; and as the subject is of course interesting to our readers, we extract the facts ascertained by the experience of this one company. Over a total insurance of eight millions, property amounting in value to 8819*l.* 11*s.* 4*d.* was destroyed by 128 fires between January 1, and November 30, 1854. Of these fires 49 (destroying 5214*l.* 6*s.* 11*d.*) were the work of an incendiary, 17 (destroying 181*l.* 5*s.* 10*d.*) were by lightning, 20 (destroying 1211*l.* 18*s.* 10*d.*) were by children and others playing with lucifers, 2 (resulting in a loss of 430*l.*) were by steam threshing machines, and the remainder are classed as "general."

Of these causes, lucifers and incendiarism (which will be reduced as education does its work) are the principal. The latter, it is assumed, will be in some degree checked by the practice adopted by some insurance offices of posting up large bills on those premises which they have insured, which after stating that no lucifers are to be used nor pipes smoked, go on to say—"*This farm is insured; the fire office will be the only sufferers in the event of a fire.*" On this the reviewer properly remarks that the crime is very far from being prompted by personal ill-will—it is often the result of mere general discontent and misanthropy. Kind treatment of labourers, however, and of neighbours of that class generally, though it may not altogether hinder incendiarism will certainly prove of service in the event of a fire by the hearty good-will with which assistance will be rendered towards its extinction. On lucifers as a cause of fires, it is stated that one large fire insurance company has lost 10,000*l.* a year since their introduction; and they are sufficiently mischievous in the hands of children, or, indeed, of carelessness of any age, to render the absolute denial of matches to farm labourers about the stacks and buildings a most reasonable and right precaution.

The following are the precautions suggested by Mr. BEAUMONT, secretary of the County Fire Office:

Forbid the use of lucifers and the practice of smoking in or near the rick yards. Ricks to be placed in single line, and as far from one another as conveniently possible. Hay ricks and corn ricks to be placed alternately. Rick-yards to be kept clear of all loose straw. A pond to be provided close to the rick-yard. The steam threshing machine to be always placed to leeward of the rick, and as far from it as may be; the loose straw to be removed continually from it, and two or three pailsful of water to be provided close to the ash-pan, which should be always full of water.

Some of these instructions will of course be modified by other considerations than the risk of fire: it is not, for instance, very likely that hay-ricks will be alternated with corn-ricks, or that the latter will, when the whole produce of the farm is brought together, be placed in single file upon the ground. The remarks about the use of the portable steam-engine, and the order about lucifers and smoking, are self-evidently right and reasonable.

Mr. BEAUMONT further gives instructions how to act when a fire breaks out in a rick yard. The main point is not to disturb the burning rick, which should at once be placed under the superintendence of the most trustworthy man on the spot, who is to see to its not being disturbed or scattered. Measures for the extinction of the fire by pressure and by water are of course to be applied; but the main and immediate labour should be directed to hindering the fire from spreading; and this is to be done by covering the neighbouring ricks with all the blankets, tarpaulins, &c., that can be procured from the house and from neighbours, soaking them constantly with water, and placing them especially on that side and those parts on which the wind blows.

The main purpose of the article in the *Review* is to detail the general statistics of fires, more especially within the London district; but this incidental reference to agricultural fire insurance seemed important enough to deserve this notice of it.

WE learn from the letter in another column that the sale of Mustard-cake for Rape-cake at Hull the other day was not fraud, but accident or negligence. The broker through whom the cake was purchased, and who at once indemnified the owner of the cattle for his losses, failed, on a second trial, to obtain a verdict against the merchants from whom the cake was procured. The cake, it appeared in evidence, was sold not as Rape-cake but as manure-cake. We have a full report of the trial before us, and of course the evidence is conflicting enough, but that version of the affair seems to have been believed by the jury; and so although it is asserted that Rape-cake was asked for, yet the sample and the bulk having been delivered as manure-cake, those who suffered from its use as food were not allowed to charge their losses on the merchants. The only use we would make of the occurrence is to point out not only the liability to error in dealings of this kind—a matter of importance where so much may hinge upon it, but the difficulty which there is even to experienced persons in detecting error. The broker through whom this business was transacted is innocent throughout of all but blundering, which in a person of his experience would seem remarkable were there not other instances equally

mistaken. The following, for example, is an extract from the evidence:—

Thomas [illegible] and crusher and oilcake manufacturer—I have manufactured Mustard-cake, not frequently, but have done so. When made it is sold to a dealer, easily distinguishable from Rape-cake. The difference in price varies from 2s. 6d. to 5s. per ton. Between Rape and Mustard, there is a little difference in the colour. Rape-cake is of a green colour; Mustard-cake is yellow.

Cross-examined. There are several kinds of Rape-cake, and several kinds of Mustard. A man in the trade could distinguish them. I never mix Mustard and Rape in manufacture. I sometimes buy damaged cake when I have a customer who wants cheap cake. I do not then mix the cakes.

By the Jurors—Generally speaking the quality is easily distinguishable by sight. I never saw any green Mustard-cake; never saw any so green as this; this is an average colour of green Rape-cake. Brown Rape-cake can be told from brown Mustard because it is so much browner. Mustard-cakes do not vary much in colour. Green Rape-cakes do not vary much in colour. Brown Rape does not vary much in colour. This is light coloured Mustard-cake. I will not taste it. (Laughter.)

Mr. Deacon—There is not a bit of Mustard in it. I will call Mr. Scott to prove that it is Rape-cake. (Laughter.)

The Jurors taste it, and says—It is Rape-cake.

Mr. Deacon—That is Rape-cake. (Laughter.) There is the infallible Mr. Jackson. (Renewed laughter.)

Jackson (taste)—I should still say it is Mustard-cake. It is stronger than the Rape.

Mr. Deacon—Don't eat all that cake.

We suppose Mr. Jackson to be, as represented, a person of experience, and it appears from his evidence that an examination, such as may be made by inspection, taste, &c., on the spot, fails to distinguish the wholesome Rape-cake from the poisonous Mustard. Indeed from Dr. Voelcker's letter at p. 42, it is plain that the difference does not exist in the dry cakes; the formation of the poisonous irritant—the characteristic volatile oil of Mustard—being the result of maceration in cold water, by which, or rather by the peculiar fermenting process which ensues, a harmless substance called myronic acid is converted into the irritating oil of Mustard. The attention which has been directed by the trial to this subject will be useful, as every beacon is that points out dangers, risks, and liabilities, whether from fraud or carelessness.

The *Dublin Farmers' Gazette* has, by its correspondents and otherwise, recently been usefully informing its readers on the Rearing and Feeding of Calves; and as the subject will soon, in the order of the season, be forced upon the attention of all stock breeders, we will contribute to the discussion a description given us of the method adopted in Berwick-shire by one of the most intelligent farmers in that county. It is no detraction from the value of the letter that its date is Aug. 21, 1843, for it describes a practice which was successful then, and is successful still, in what Mr. Mechi does not believe—the profitable manufacture of beef:—

I rear about 25 annually, and pursue substantially the same system, which I shall endeavour to give you in as minute detail as I can. I keep from eight to ten cows; our calculation being that each cow should keep from two and a half to three calves. As the growing of beef is our object, we do not trouble ourselves about pedigrees, but endeavour to have cows combining in as great a degree as possible those qualities most suitable for our purpose. They must be good milkers, otherwise we cannot rear a sufficient number of calves; they must have a ready tendency to fatten, and come early to maturity, otherwise we cannot sell the produce fat at two years old; and they must have good size, otherwise there will be a short-coming in the weight of beef. In other words, they must be well-bred short-horns, only paying more attention to their milking properties than is usually done by breeders of bulls. We do not in general attempt breeding bulls ourselves, but go to some one of the noted breeders in Northumberland, and purchase as good an one as we can get; use him for two or three seasons, and then fatten him, and return to the same source for a fresh one. In order to have as level a lot as possible, my practice is to allow the cottagers on my own farm, and some others in the neighbourhood, to send their cows to my bull gratis, on condition that I shall get the calf at fair market price, if I require it. In this way I usually have my entire lot the progeny of my own bull. I endeavour to have all my cows to calve, if possible, betwixt 1st February and 1st April. If they are much earlier, the cows get almost dry before the grass comes; if they are much later, the calves cannot be got off fat with the rest of the lot. If they could all be got in February, it would suit all purposes best.

As soon as a calf is dropped, I have it removed from its dam and carefully rubbed with wisps of hay until it is dry, imitating as closely as possible what the dam would do if allowed to get at it with her tongue. It is then put into a crib in the calf-house and covered over with dry straw, and gets a little of its own mother's milk from the pail as soon as possible. For the first fortnight it gets milk only, but as much of that as can be spared. If pains be taken, it will usually at this age begin to eat a little oilcake and sliced Swedish Turnips. The oilcake should be broken about the size of lump sugar as brought to table. The servant should have a piece ready to put into its mouth after drinking its milk, as it is then disposed to suck anything which it can get hold off. By doing this a few times, and putting a few pieces into its trough, it will soon begin to eat of its own accord, and should then get as much oilcake, Turnip, and hay as it will eat, for when it has fairly taken to this kind of food its allowance of milk can be diminished, so as to meet the necessities of the younger calves which will be coming on in succession. This is the more needful, as I never, if it can possibly be avoided, give them any liquid except unadulterated milk—warm from the cow. When there is a necessity for resorting to a substitute, I generally use sago boiled in water till it forms a thick jelly, and allowed to cool to the same temperature as the milk with which it is mixed at the time of feeding. My cows are milked three times a-day, and the calves fed as often, the milk being carried direct from the byre to the calf-house.

When the calves have attained to eight weeks old, their mid-day allowance of milk is usually withdrawn, as they can then eat dry food in sufficient quantity to meet their necessities, and it is of more importance to have the milk for the younger calves which are almost entirely dependent upon it. It is always with very great reluctance that I allow anything to be mixed with the milk by way of helping the quantity, as the certain consequence of doing so is, that a sour smell meets you on entering the house, giving evidence that there is indigestion to a greater or less degree. The cows at this season should be fed with white Turnips, as the quantity of milk is greater than when Swedish Turnips are used, and, moreover, much more wholesome for the calves. The milk from the latter is certainly richer, but a lengthened trial has satisfied us that it has a tendency to induce inflammatory attacks in the calves fed upon it. As the calves get from four to six weeks old we remove them from their cribs into a larger house, where eight or ten can be accommodated together and have room to pick about; and when the fat cattle are sold they are put into the most sheltered feeding yard, where they have still more room and are gradually prepared for being turned out to the home paddock. I am never in a hurry to put them to Grass, and have them brought in at night for several weeks after they are turned out. At four months old they are entirely weaned from milk, and are put upon a piece of good seeds, and continue to receive at least a pound of oilcake daily during the summer, or until they have so evidently taken with the pasture *as to be improving in condition.*

They should not lie out at night very late in autumn, but so soon as the nights begin to lengthen and get chilly they should be brought into a yard at night, and get some second cuttings of Clover, Tares, or such like, and Turnips whenever they are ready. Whenever put on Turnips the daily allowance of oilcake must be renewed and continued all through the winter and spring until they are again turned to Grass. This not merely promotes their growth, but as far as the experience of five or six years can determine the point, it appears to be a specific against blackleg, which was often so fatal in this neighbourhood as to deter many farmers from breeding altogether.

It is well to keep in view the purpose for which Linseed cake is used at the different stages of their growth. When first given the object is to accustom them to a wholesome and nutritious kind of food, which when once taken to enables you to rear a greater number of calves on a given quantity of milk; and then again, when the milk is entirely withdrawn, you can by increasing the allowance of cake entirely prevent that check to their growth and loss of condition which inevitably takes place when they are weaned from milk and have Grass only to depend upon. But I give cake during the following winter along with Turnips, for the *specific purpose of preventing* black-leg; for, saving this, I believe that Turnips, *ad libitum*, with a little bruised grain, would fatten them equally well at rather less expense. When put to Grass as year-olds, they grow decidedly better on seeds than on old pasture. However, if they have been well done to, and are *very forward in condition*, they will do better on the old pasture than they would if leaner. They should be put on Turnips again as soon as the latter are ready; and it is seldom that we give anything more than Turnips and straw. We feed them all in open yards with a good warm shed attached, care being taken to keep both yard and shed, but especially the latter, well littered, that they may always have a comfortable bed to tempt them to lie as much as possible. They are fed twice a day in troughs built along by the yard wall, into which the Turnips are put whole, and chopped by a transverse knife which cuts each Turnip into four pieces. Globe Turnips are used till near Christmas, and then Swedes till May, when they are usually sold.

I think I have now stated everything of importance connected with your inquiry, and much, I dare say, that you knew better about before than I could tell you. The leading feature of our system, as you will perceive, is to feed well from ever the animals are born, taking especial care to secure a progressive improvement. If at any time they get low in condition, there is not only a loss of time, but a needless waste of food ere the lee-way is made up. It is also of the greatest importance to select the calves with care, and *not to attempt to rear more than you can do thorough justice to all along.*

There has been no announcement made as yet in accordance with the Act for the provision of a Metropolitan Market instead of Smithfield: and on inquiry at the City architect's office, we were informed that no information exists there as to the period when the new market will be opened. It was rumoured the other day that a letter had been received from the Home Secretary objecting to some of the arrangements, and among others to the retention of the Monday as the market day.

DISTRIBUTION OF HORSE LABOUR.

We shall detail the mode of cultivation of each of the crops in due rotation on a farm of 240 acres, showing the quantity of horse-labour required in each month, when it is most proper to have the work done.

The Field No. 1: 30 acres; 25 acres in Swedes, and 5 acres in Turnips.

The kind of horse labour required for Turnips.	The months when the work should be done.	Days' work of a man and two horses.	
To be ploughed the first time ...	January & February	30	
„ carting 450 loads of manure	March	9	39
„ ploughing in the manure ...	March	30	
„ cultivating the ground with three horses	May	9	15
„ a double turn of the heavy harrow	May	6	
„ carting 300 loads of short prepared dung	June	6	33
„ cultivating deep to mix the dung on the surface ...	June	9	
„ a double turn of the harrow	June	6	
„ rolling	June	2	
„ drilling up the land making two drills at one bout ...	June	10	
„ horse-hoeing Swedes... ...	July and August		18

This is 20 days in January, 10 in February, 39 in March, 15 in May, 33 in June, 9 in July, and 9 in August; in all 135 days.

No. 2: 30 acres in Wheat after the Turnips.

The kind of horse labour required.	The months when the work must be done.	Days' work of a man & pair of horses.
To ploughing the land with a shallow furrow	October	30
„ a double turn of the harrow ...	October	6
„ drilling the seed in rows 10 in. apart	October	3
„ a double turn of the harrow ...	October	6

This field requires 45 days of two horses in the month of October.

No. 3, of 30 acres: 10 acres to be in Winter Beans.

The kind of labour required for Beans.	The months to do the work.	Days' work of a man and two horses.
To cultivating the land twice across each other	August	9
„ a double turn of the harrow ...	August	2
„ carting 200 loads of manure ...	August	4
„ ploughing the land	August	10
„ two double turns of the harrow ...	August	4
„ drilling the Beans	August	2
„ horse-hoeing twice	April	2

These 10 acres of No. 3 require 31 days' work of two horses in August, and 2 days in April.

No. 3: 10 acres in Carrots.

The kind of work required for Carrots.	Time when the work should be done.	Days' work of a man and two horses.
To carting 250 loads of manure ...	August	5
„ ploughing in the manure 8 in. deep	August	10
„ cultivating twice across	March	4
„ manuring the double time ...	March	4
„ rolling and drilling	March	3

This crop of 10 acres requires 15 days' work of a pair of horses in August, and 11 days in March.

No. 3: 10 acres in Potatoes.

The kind of work required for Potatoes.	Time when the work should be done.	Days' work of a man and two horses.
To carting 250 loads of manure ...	September	5
„ ploughing in the manure deep ...	September	10
„ ploughing the land the 2d time	February	10
„ harrowing a double time ...	April	2
„ cultivating twice across	April	3
„ drilling for and covering the Potatoes	April	6
„ horse-hoeing twice	May	2
„ drilling up the Potatoes	June	3

This crop requires 15 days' work in September, 10 days in February, 13 days in April, 2 days in May, and 3 days in June.

No. 4: 30 acres, to be in Wheat.

The kind of work required for Wheat.	The months when the work should be done.	Days' work of a man and two horses.
To ploughing the land twice after the roots are off	November	30
„ a double turn of the harrow ...	November	6
„ drilling the seed	November	3
„ a double turn of the harrow ...	November	6

This crop of Wheat requires 45 days' work of a pair of horses in November.

No. 5: 30 acres, in Mangold Wurzel.

The kind of work required for Mangold Wurzel.	The time to do the work.	Days' work of a man and two horses.
To ploughing first time ...	Oct., 10; Nov., 10; Dec. 10	30
„ harrowing a double time	Jan., 2; Feb., 2; Mar. 2	6
„ carting 450 loads of manure	Jan., 3; Feb., 3; Mar. 3	9
„ ploughing in the dressing	Jan., 10; Feb., 10; Mar. 10	30
„ cultivating	April, 4; May, 5	9
„ harrowing a double time	April, 3; May, 3	6
„ carting 300 loads of short manure	April, 3; May, 3	6
cultivating and mixing the short manure on surface	April, 4; May, 5	9
„ drilling up the land for plou.hing	April, 4; May, 5	9
„ horse-hoeing 4 times ...	May, 6; June, 6; July 6	18

This crop requires 10 days' work in October, 10 days in November, 10 days in December, 15 days in January, 15 days in February, 15 days in March, 18 days in April, 27 days in May, 6 days in June, and 6 days in July; in all 132 days of two horses.

No. 6: 30 acres, to be in Wheat.

The kind of work required for a crop of Wheat.	The months when the work should be done.	Days' work of a man and two horses.
To ploughing the land after the roots are off	December	30
" harrowing the land a double time	December	6
" drilling the seed	December	3
" harrowing the land a double time	December	6

This crop of Wheat requires 45 days' work of two horses in December.

No. 7: 30 acres Clover.

The kind of work required for the Clover crop.	The time when the work should be done	Days' work of a man and two horses.
To be rolled	April	2

This crop requires the labour of a pair of horses two days in April.

No. 8: 30 acres in Wheat after Clover.

The kind of work required for a crop of Wheat	The time when the work should be done	Days' work of a man and two horses.
To ploughing	September	30
" harrowing it three double times ...	September	18
" drilling the seed ...	September	3
" harrowing the land after the seed a double time	September	6

This crop requires 57 days' work of two horses in September.

Abstract of the amount of horse labour required during each month on the whole of the arable land.

	Jan.	Feb.	March	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
The Field No. 1	20	10	39	...	15	33	9	9				
" No. 2	...	...	...	...	...	...	...	...	...	45		
" No. 3	...	10	11	15	2	3	...	46	15			
" No. 4	...	...	...	...	...	...	...	...	...	...	45	
" No. 5	15	15	15	18	27	6	6	...	...	10	10	10
" No. 6	...	...	...	...	...	...	...	...	...	...	...	45
" No. 7	...	...	...	2								
" No. 8	...	...	...	...	...	...	...	...	57			
	35	35	65	35	44	42	15	55	72	55	55	5 5

From the above table it appears that 363 days' labour of a pair of horses is required to be done during the year, and the greatest amount of labour is required in September, being 172 days besides the horse labour in carting the harvest, which may require 26 days more, but part of this work may be spread over August and October.

The following table will show the number of working days, in which land that has been perfectly drained will be in a proper working condition in each month, the working hours each day, the extent of land which may be ploughed each day, and the acres ploughed per month.

Months.	Dry working days.	Working hours on each day.	Extent ploughed each day.	Acres ploughed per month.
January ...	14	8	1	14
February .	14	8	1	14
March ...	18	9	1⅛	20
April ...	20	10	1¼	25
May ...	20	10	1¼	25
June ...	20	10	1¼	25
July ...	20	10	1¼	25
August ...	20	10	1¼	25
September	20	10	1¼	25
October ...	18	10	1¼	22
November .	18	9	1⅛	18
December .	16	8	1	16
	216	...	...	254

By this table we find there are 216 dry working days in the year, and that a man and two horses can in that time plough 254 acres of land, and we have found that the greatest number of days' work required under this system of cultivation is in 72 days of a pair of horses in September; and as there are but 20 working days in that month, we shall require at least 3½ pairs of horses, so as to have a sufficient horse power to meet all circumstances of the weather. We therefore propose to have seven working horses, besides a horse which may be used in the gig, and work in the cart or plough when wanted. *J. M.*

STATISTICS OF CATTLE FEEDING.

In my remarks on feeding (*Agricultural Gazette*, Sept. 30 and Oct. 7), I adverted to the effect of costive and laxative food on the live weight of the animal. As my cattle have since then undergone a change of treatment and of habitation, I supply three weighings of my milch cows, from which this effect appears clearly exemplified:—

	Live Weight.				
	October 3.	October 31.	Weight less.	Nov. 28.	Weight more in 8 weeks.
	cwt. qr. lb.	cwt. qr. lb.	lbs.	cwt. qr. lb.	lbs.

During summer and up to the first week in October, these cows were turned out on a near pasture during day, and housed during the night. Each morning and evening they were supplied with steamed food, of which I gave a description in the *Agricultural Gazette*, Sept. 30. On this fare their evacuations were of proper consistency; during the remainder of October they were wholly housed, and were supplied with cut aftermath or eddish, together with three feeds of steamed food per day. On this fare they were relaxed, and when weighed on the 31st October the ten animals which were under treatment the whole of this time showed a deficiency of 59½ lbs. each on the average. During November their Grass was changed to 12 lbs. of hay, with 30 to 40 lbs. of Cabbages each, with the like allowance of steamed food. On this their evacuations were restored to their proper consistency. It will be seen on reference to the weights, Nov. 28th, that the same ten cows had not only regained the loss shown when in a relaxed state, but 45 lbs. each on the average, or 5½ lbs. per week on the whole eight weeks in addition.

The quantity of material supplied as food and in progress through the system will be found to have a main influence on the comparative live and dead weight of cattle. If we take into consideration a full grown animal in fair store condition, which has been on Grass or other bulky food, and has filled itself, and treat it for fattening, I am of opinion that the gain in weight will be wholly to useful vendible material, and that the quantity of material in process through the system will not increase, but when prime there will be a decrease. I cannot otherwise account for the circumstance, that fat cattle which yield largely of loose fat, which counts as offal, weigh heavier when killed, carcase weight, than those of the same live weight which have less of loose fat. The capability to contain a greater quantity of this material may be inferred from the circumstance that animals fed to satiety weigh 60 to 80 lbs. more in an evening than before their meal the following morning. I have known a beast, which in contending with the cold of October, had gorged itself on aftermath, on being changed to feeding in stall, weigh less by more than 1 cwt., evidently without loss of condition. The necessity of the weighings being timed at like hours will be obvious; mine always take place in the morning before a meal. I may now mention one satisfactory result attendant on these monthly weighings. It enables me to compute with greater accuracy the proportion of live and dead weight; for a well-fed beast I calculate on 21 to 12, or 100 to 57⅛, and modify this according to condition, &c. On four cattle sold in December at 18*l.* each, my purchaser supplied me with the weights of carcase and of loose fat, which I subjoin:—

	Live weight.			Computed weight.	Actual weight.	Loose fat.	Together.
No.				stones.	st. lbs.	lbs.	st. lbs.
2	10 2 0	at 21 to 12		84	82	88	93
3	9 3 0	... ...		78	79 2	80	89 2
7	10 1 0	... ...		82	81	98	93 2
8	10 3 0	... ...		86	85 1	64	93 1
				330	327 3		

It will be observed that the computed weight differs only from the actual weight, 21 lbs. on the whole four. Now, though I do not in every instance pretend to a like accuracy, yet I think it improbable that I err to the extent of 5 per cent.; indeed, I have no hesitation in ensuring a respectable purchaser against any such deviation.

Nos. 7 and 8 differ 56 lbs. in live weight, 33 lbs. in carcass or dead weight, and only a single pound in vendible material, carcase and loose fat together. The two animals being very similar in thickness of hide, and strength of bone, the only mode of explaining the difference in the live weight and vendible material appears to be by supposing that the riper beast, No. 7, contained with more of fat, less of waste offal, or material in process through the system, or that with the increase of internal fat, there occurs a displacement of this material.

I now proceed to explain my views on a subject of importance to feeders—the relative cost of live or store stock to that of fat. In order to assure your readers of my competency on this subject I may state that I make my own bargains both as buyer and seller; and that, on my purchases arriving at home from market or fair, I attend to the weighings, to ascertain their comparative cost. On looking over my purchases for some time, I find that on comparing the live weights of lean or store cattle which have had one or two calves—a description which I find answer my purpose best for stall feeding—their cost averages less by 2*l.* to 3*l.* each than that of fattened animals of the same live weight. On comparing the estimate of carcase or dead weight of the two, the result is different. Take for example a beast of 9 cwt. when fat; I should compute her weight as 21 live to 12 dead weight. The opportunities of ascertaining the comparison of live and dead weight of lean stock are by no means so frequent as of fat. The scale of weights in "Morton's Cyclopædia" give those of half fat at 100 live to 50 dead weight: it has come within my own observation that partly fed animals have yielded less than one-half of their live weight. I am therefore disposed to estimate the relative weights of store stock in the condition in which I usually buy them, as 100 to 43 or 46.

Live Weight.

	cwt. stones	stones	£ s. d.
A fat beast of 9 or 126, at 21 to 12, =	72, 4*s.* ...	14	8 0
A lean " of 9 or 126, at 100 to 43, =	54, 4*s.* ...	10	16 0

Now, when beef is at 6*d.* per lb., I should expect to purchase a beast of 9 cwt. live weight for 12*l.* It will thus appear that store stock are cheaper by 2*l.* to 3*l.* each, reckoned on the live weight; yet reckoned on the dead weight they are dearer by 1*l.* to 1*l.* 4*s.* I should compute the store animal of 9 cwt. live weight to weigh, when fatted, 12 cwt., to attain which would require 24 weeks feeding, at a gain of 14 lbs. per week. The 12 cwt. would then be 168 live at 21 to 12, equal to 96 dead weight, and the value, taken also at 6*d.* per lb., would be increased to 19*l.* 4*s.* for 24 weeks, or at the rate of 6*s.* per week. If the animal have undergone a change of food, some little should be allowed for this. I have no hesitation in saying that such a gain per week on stall feeding is not more than my practice leads me to calculate upon, or than I usually obtain. If I assume a higher proportion for store stock, say 50 per cent., the increase at 14 lbs. per week would consist of

11 lbs. per week	or 24 weeks,	33 stones,	meat or carcass weight
3 lbs. "	" 24 weeks,	9 "	of offal
14		42	

On looking over the different items of offal of a full grown animal, I cannot find that they are capable of increase to anything like the extent of 72 lbs. I except the tallow or loose fat, with the increase of which, as I have already observed, there is a concurrent increase of the carcase or dead weight.

An animal of 9 cwt. in store condition may probably contain 30 to 40 lbs. of loose fat; after 24 weeks of feeding, I should calculate on a yield of 100 to 112 lbs., being an increase of 3 lbs. per week, which will be in addition to the gain of meat or carcase weight; if then there be a gain in weight of 14 lbs. per week, there will be an additional gain in loose fat of 3 lbs. per week, making together 17 lbs. per week of vendible material It will be observed that the proportion of live to dead weight, whether this be 100 to 50, or 100 to 43, does not affect the money gained per week. If I purchase an animal of 9 cwt. for 12*l.*, and after 24 weeks feeding sell it for 19*l.* 4*s.*, the return for food will be at the rate of 6*s.* per week.

These calculations are applicable to full grown animals, which have had their fill of bulky food, but not to young growing stock, or to such as have been hungered or driven to a distance. This will appear from the following observations, on 12 heifers 2½-years old, which I bought at a Easter fair in 1854; they had been brought thither from a distance of from 20 to 30 miles, and travelled nearly a like distance home, being on the way but scantily supplied with hay. Their weight on arrival was 6½ cwt. each on the average; as they were intended for grazing in a pasture at some distance from the homestead, they were kept in stall till the 16th of May, on hay only with water, when their weight was found to average 7 cwt. 1 qr. 4 lbs., or 88 lbs. each more than on arrival. It will be clear that this gain of weight was almost wholly due to the process of filling, and with little or no addition to the carcase weight. *Y.*

(*To be continued.*)

Home Correspondence.

Steam Cultivation.—I have just read the observations of your correspondent "A Farmer in Embryo," on the subject of steam cultivation. I wish your correspondent to refer to the articles on steam cultivation in Nos. 5 and 38 of the *Agricultural Gazette* for 1850. He will there see how lucidly and logically Mr. Hoskyns has defined the "Method of the Horse," the "Method of the Machine," and the "Method of the Man" in executing work. His explanations, illustrations, and deductions are indisputable; he demonstrates as clearly as possible that the "Method of the Horse" is to go "right ahead;" but that the "Method of the Machine" is to go "right round!" After this clear and faithful explanation of how the different powers operate, if your correspondent reads on, he will observe Mr. H. proceeds to make or fabricate a very good and available species of mechanism for the purpose of tilling the land by steam-power; but how does he then describe this machine as used on the land? Your correspondent at this, the critical point, will discern how strong the "Old Adam" is, even in such a man as Mr. Hoskyns — for he proposes (in direct antagonism to his own deduction) that his steam cultivator should be dragged "right ahead," just after the method or manner of the horse-cum-plough, cutting up a ribbon of earth of definite width, but probably half a mile or more in length. Now what can Mr. Hoskyns have to urge in defence of his using a steam machine precisely after the method of a horse with the plough? Set a man to dig a rod of land, and who ever saw him take that quantity out in a ribbon of earth 1 spit wide and 90 yards in length, by going "right ahead," after the manner of the horse? No, you will generally find the individual standing stock-still nearly in one spot, until he has dug a rod of land. Why does the man behave in so non-agricultural a manner? What induces him to move his heavy carcase about so little in executing a given amount of work? I will not enter into the discussion now; but I should like to know how it happens that Mr. Hoskyns has proposed to use a steam cultivator precisely after the method of the plough. *C. Burcham*, 4, *Seymour Street, Euston Square.* [Does not the man in digging to and fro over a *plot* move just about as much as if he dug from one end of the field to the other along the edge of a furrow?]

Law Expenses.—Mr. Jno. Ay, of Winscombe, complains that a purchase he has lately made of land at the price of 410*l.* has cost him in law expenses 74*l.* Now, no one can judge between him and his solicitor, who, although not named, must be known to those acquainted with the locality and with Mr. Ay, which I am not, and I submit that in justice to the solicitor Mr. Ay should

go a step further and send you his contract and the bill, which, if you will publish, I will undertake to remark upon, not as between him and his solicitor, but as regards the landed interest of this country. A vendor is sometimes put to heavy expenses. I have known cases where, in a purchase to the amount of thousands, the whole amount would have been absorbed if the purchaser's solicitor had not had sufficient moral courage to waive the legal rights of his client. A purchaser is, however, differently situated, and generally forewarned, and the amount mentioned appears to be indeed excessive without explanation. *A County Solicitor of 35 Years' Practice.* [There is no queston between Mr. Ay and his solicitor. This, we may mention, was expressly told us by him in an accompanying note. The case was described, not for its personal bearing at all, but simply as illustrative of the general subject.]

Spade Husbandry.—A correspondent (J. Hamilton) in your Paper of the 6th inst. declares his intention of cultivating 50 acres with the spade. With your permission I will state a course of cropping which I have found beneficial, and possibly it may be in some respects new to him. My land (9 acres) is a stiff clay mixed with flint, with a chalk subsoil several feet beneath the surface. The course I have followed is five-fold. 1. Beans.—For these the ground is well manured and dug with the Kentish spade in the autumn. The Beans are put in in rows 23 inches apart with a one-horse drill plough; they are hand and horse-hoed, and every weed carefully extracted. As soon as the Beans are cut the horse-hoe is again sent to work across the Bean stubble. 2. The land being now quite clean, the Wheat is drilled in by the same drill plough, without digging the ground. The advantage from this plan is saving of expense in digging the land, a firm seed-bed, freedom from wire-worm and seedling weeds. As soon as the Wheat is carried a man goes over the ground, and carefully digs up every weed. 3. The ground is then prepared for the third crop (Oats) thus:—It is dug two spits deep with a spud or fork, about one spit in three of the subsoil being thrown on the top, the rest merely turned. This work can be done for about 4½*d.* or 5*d.* a rod [!]; 2 cwt. of guano can be added if necessary. 4. The fourth crop is a root one, for which the ground is weeded, manured, and dug roughly in the autumn, and it works down finely in the spring. 5. The roots are followed by Wheat and Barley in equal proportions. This completes the rotation. My stock is confined to my horse, cows, and pigs, who consume the Oats, Beans, Barley, and roots, and make a large supply of manure. *P. R.*

Lois-Weedon.—Notwithstanding the rather wide discussion of the Lois-Weedon inquiry, I think there is still much to be said in the matter. I must think that even among the most scientific, the best instructed, there has been some misapprehension, some overlooking, and among the more practical certainly there have been very often mistakes, and a short-sightedness which, in spite of the very plain instructions of Mr. Smith, has led to error and failure in attempts to work out his plan. Even Mr. Smith himself, if I may say so without presumption, may do more than the needful in bringing up so often and so much of the cruder subsoil, and thus, in the cost of an annual double digging, adding an obstacle to the more general adoption of his plan, to the more general acceptation of his principles. In a subsoil even moderately replenished with the inorganic food of plants, a far less quantity of it exposed to atmospheric influence would surely supply crops of greatest demand with enough of it. Indeed, the amount of organic matter that the air can supply is but sufficient to act on a very small part of the inorganic substances that are brought up, and I see not the necessity for bringing up more of the latter than the former can saturate. Mr. Piper in his experiment, so far from bringing up any subsoil, does not even bring up the under active soil. His light manuring may in some degree furnish a succedaneum for deep digging; but is it not possible that the mere keeping open the surface to atmospheric inflow may be sufficient to induce an organic action in the subsoil equal to the demands of the crop? In the late lecture on Mr. Smith's system at Oxford, Dr. Daubeny seems to overlook that Mr. Smith uses up his ammoniacal manure on those crops to which the natural supply is not sufficient. "I do not throw away my manure," says Mr. Smith, and I must think his objection to its general application is rather weak. Dr. Daubeny admits that the organic supply from the air is sufficient, which is indeed all Mr. Smith contends for, but observes, "before such a result" (the general applicability of the system,) "can be arrived at with any kind of confidence, trials must be made on limestones and on granites as well as on clays and loams, and on light soils as well as on heavy ones. Until this has been done, it is impossible to predict in any particular case that a sufficient amount of ammonia can be absorbed by the soil through the mere process of pulverisation, to answer our purpose and to provide materials for an abundant crop." Is it possible to conceive any soil under due pulverisation, its surface being kept open and unpuddled, can refuse to absorb all the ammonia that falls on it? It is not of this capability of absorption, but of retaining that there can be any question. Now, under this system of Mr. Smith's of continual working the surface during the growth of the crop, the retention of ammonia seems of less moment than the absorption of it, for the plants are there ready to drink it in as it falls. The retentiveness of the soil is foreign to the question, excepting in so far as it holds with respect to all tillage and the fruitfulness of all soils. In the same lecture a letter of Mr. Cutterbuck's raises an objection on the score of labour and its interfering with the necessary labour on green and root crops at the time they require it, but the heavy labour, the double digging, takes place in the winter, when certainly the tillage of root and green crops do not demand manual labour. Any difficulty in spring and summer labour I think may be removed by using in the intervals a horse and a drill grubber, or other similar implement, all that is necessary then being to keep the surface open and clean. There cannot be a question that three-fifths of the land is under crop, but I go farther than Mr. Cutterbuck, and assert that in effect the whole land is cropped, and in this I conceive lies a great advantage of the system, that while a full crop is obtained a fallow is got too. The crop draws in its nourishment from all the circumambient air of the whole field, while to the roots flow all the soluble matters of the whole ground, as well from the worked intervals as from the parts actually occupied by them, or the whole theory falls to the ground, for it is built upon the organic sufficiency of the atmospheric matters absorbed by the whole field, and on their operation in rendering soluble and accessible to the roots of the plants the inorganic substances in the whole of the ground. But the greatest benefit conferred on agriculture by the Lois-Weedon plan has been overlooked. It is not as a whole in itself that we must prize it, but as a part: it is in a connection with the general cropping of land—as a clean and disintegrating preparation for other crops. After a few years of such a system of grain growing, of Barley or Oats where the land is not fitted for Wheat, how clean and well prepared is the land for the reception of small seeds, whether those of our ordinary green crops or of Clovers and Grasses; how highly oxygenised, carbonated, and ammoniafied with an abundant supply of inorganic matters in a soluble state or ready to assume it! *J. M. Goodiff.*

Is "Under-ground Manuring" a Novelty?—I see by the *Gardeners' Chronicle* of Saturday last that a Mr. Wilkins has taken out a patent for under-ground manuring, and that he has had ability enough to induce the good people of Oxford to subscribe a sum of money to carry out what he calls his experiment. As the gardeners near Chelmsford have been in the habit of using this plan for the last eight or 10 years, in consequence of the late Mr. Wix, solicitor, of Chelmsford, who was an excellent gardener, having got the prize there for early Celery grown in this way, I should like to know if a toll is now to be levied upon those who have long been accustomed to the use of this mode of using liquid manure. My gardener tells me it is now eight years since it was so used by my desire. Mr. Wix's plan is to place two rows of common land draining pipes one on each side of the Celery, and the liquid is introduced by the upright pipe, as described in Mr. Wilkins's plan. The objection to any permanent laying down of pipes is that it is well known by agriculturists, although probably not by a chance audience either at Oxford, Reading, or London, that the roots of Mangold Wurzel run a long way for their food, and that, consequently, these roots would soon block up the pipes; and if they were kept out by cement or collars, or any other scheme, the object of introducing the liquid manure in a proper manner would be most certainly defeated, as you say it can never be adopted to any extent except in gardens, and I confess I see no advantage after eight years' experience (of this now called new science) in having the pipes permanently fixed. I am decidedly of the contrary opinion. I must enter my protest against this scheme being considered a novelty. Although Mr. Wix has been dead some years, it might easily be ascertained when, where, and how he adopted the plan. As this scheme is altogether upon a contrary principle to that adopted at Tiptree Hall, no doubt it is open to try various extensions of this mode of growing plants. Any man with a few pipes may easily satisfy himself of the advantage of growing Celery by this plan. I have no doubt of the truth of all the circumstances stated by Mr. Wilkins; I only enter my protest against its being considered a novelty. If you think it worth while you are at liberty to state what I have said in the *Gardeners' Chronicle. J. T. Tyrell, Borcham House, Jan.* 29.

Poisonous "Rape" Cake.—Observing in your last week's paper a reference to some Mustard cakes which a Russian firm* had sold for Rape cakes to a broker in Hull, and which broker had sent them to a farmer, who had fed some beasts on them which had after a short time died, we, as the sellers of said cakes, beg to enclose you a report of the second trial we have had respecting them, from which you will see the firm in question got a verdict. The cakes they sold as manure cakes, invoiced them as such, and after doing all which is necessary as sellers, they are to be held accountable for the ignorance manifested by a broker, who twice sampled the bulk. They would feel obliged if, in your editorial capacity, you would notice this trial, because for the agriculturist it is an important one, and shows the necessity of sending their orders to persons well acquainted with cakes. *James Butler, 60, Waverley Street, Hull.*

Farmers' Clubs.

Wakefield.—*The Effects on the Turnip Crop of various kinds of Manure.*—At a recent meeting of this club Mr. Hunt, of Wortley, read a paper on this subject, from which we made the following extracts:—

"I have to explain to you a few experiments I have tried this season with different kinds of artificial manures. The land having been previously manured all alike with 18 tons of farm manure per acre, the results were computed by Mr. Barratt and myself, as follow:—To lot 1 was applied 2 cwt. of best Peruvian guano; to lot 2, the same cost of Mr. Simpson's Turnip manure; to lot 3 the same cost of sulphate of ammonia; to lot 4 the same cost of Sheffield bone-dust; to lot 5 30 bushels of wood charcoal saturated with liquid manure from the cattle tanks. After a careful examination we both arrived at the same conclusion, that the Turnips manured with the saturated charcoal were at least equal in bulk to the lot manured with guano, but superior in quality in consequence of the guanoed Turnips being more run to long necks. Mr. Simpson's lot we considered a good second. The bone-dust lot and the sulphate of ammonia lot not near so good. The cost of the charcoal may be considered doubtful, as I have the opportunity of obtaining it from Lord Wharncliffe's woods and plantations without payment, but I may remark that previous to my using it a person was allowed to make it for sale, by paying 1*s.* per cart load, which would contain about 60 bushels. It is necessary to explain that the material I speak of is not made from the cordwood, but merely the small branches, which are generally left after woodfalls and thinning of plantations. The burning of this into charcoal I let to a person, supplying him with a horse and cart to convey it to a shed at the farm, where he passes it through a riddle in order to separate the larger lumps from the small, and I pay him 2*d.* per bushel upon the whole. I then take the first opportunity of putting the large lumps through the bone mill, which process reduces them almost to a powder, which is then returned to the bulk. Having two liquid manure tanks at the farm, and on an average 40 to 50 head of cattle feeding during the whole of the year, of course a large amount of liquid manure is produced, which, during the summer months, is applied to the frequent cuttings of Grass consumed by the cattle. After I have ceased cutting Grass, which this season took place about the 10th of November, I apply the liquid to the charcoal until it becomes completely saturated; this I continue to do until I again require the liquid to apply to the Grass land, in order to obtain as early a cutting as possible. I have not had sufficient experience to be able to state the quantity of liquid a given amount of charcoal will absorb; but Mr. Dawson has stated that when the charcoal is fresh made it will absorb about 80 times its weight. I have tried sawdust and other matters as an absorbent for the liquid, but have never found anything equal to charcoal. I also find it an excellent deodoriser, so much so that, when a heap containing upwards of 1000 bushels has been completely saturated, no smell can be detected. As I before stated, the burning and riddling the charcoal costs me 2*d.* per bushel, therefore if we add 1*d.* per bushel for other labour, it will be 3*d.* per bushel, which, at 30 bushels per acre, amounts to 7*s.* 6*d.* per acre. I do not add any cost for the liquid, as that article I think may be valued at such various prices by other people. For my own part, I profess to produce it over and above a fair profit in my feeding operations."

Mr. Hunt then described his method of preparing land for the Turnip crop:—

"I endeavour to have the land cleared of twitch, &c., in the autumn previous, when I commence as early as possible to cart and spread upon the land the full quantity of solid manure I intend it to receive; and as fast as the ploughs can do their work, I have the same ploughed in as deep as possible (not less than 1 foot where the soil will admit). I then allow it to remain in its rough state until the spring of the following year, and when dry enough it is dragged, harrowed, and rolled; after this it remains until the time for sowing arrives. I then (without any more ploughing) ridge up lightly with a common plough one way, and cover in the saturated charcoal in the usual way on the return of the plough, when the seed is deposited by the drill as quickly as possible when the weather is dry. I have invariably found by this system a much finer mould on the surface obtained than after spring ploughing, in consequence of which the Turnips get a quicker start, which we all know has a good deal to do with the future prospect of the crop. It was frequently remarked during the late extremely dry summer, when Turnips generally gave up growing, that the Turnips in the Wortley Farm continued to grow. This I attribute to the manure having been ploughed in in the autumn to a good depth, and by not being disturbed by spring ploughing the moisture it had obtained during the previous winter was not removed, but was quietly sought for and abstracted by the roots of the Turnips striking down to it. It has been frequently said that the cultivation of a farm ought somewhat to resemble the cultivation of a garden in the preparation of soil for Turnip growing, and I think the remark is particularly well applied. Now, if we watch a market-gardener or a seedsman preparing his soil for the reception of seeds to be sown in the spring, we invariably find him applying his manure and digging it in to a good depth in the autumn, leaving the surface as rough as possible, to be acted upon by the atmosphere during the winter; but we do not find him in the spring of the following year destroying by more digging the loose surface thus obtained. Instead of which, he contents himself with simply using the rake to level the surface, knowing well that the exposure to the atmosphere during winter is a much more efficient pulveriser than the facing process he is able to submit the soil to. Such I have found the case where I have prepared the soil for Turnip growing as above stated."

* The firm stated as being a Russian firm is not so; one member is a German and the other an Englishman.

Reviews.

Remarks on the Tuberous Plants proposed as Substitutes for the Potato, &c. By F. F. Mérat, Member of the Central Society of Agriculture, Paris.

The Potato crop of last year has proved so generally successful that we may venture to entertain the hope it may be continued to us in renovated vigour and productiveness. Looking back to the many notions which have occupied men's minds as to the probabilities of finding some other tuber-bearing plants which by culture might replace the diseased and declining Potato, we have been amused, and in some respects instructed, by the perusal of the treatise published by a French gentleman under the title above given.

We picture to ourselves so many raw striplings presenting themselves as substitutes for good men and true, to a recruiting officer, and rejected as unfit for service from some serious defects. First the Dahlia advances for inspection. Forty years ago, the author informs us, it was supposed that in this plant was discovered a rival of the Solanum of Peru—its large tubers were offered in France as nutritive for man and beast, but rejected as an esculent when tasted; and no wonder—though retained as a handsome showy sentry in a garden. Next comes the Boussingaultia basellöides, vastly above our ordinary military standard, even before it was lowered to 5 feet 4 inches—of gigantic proportions, worthy of the sesquipedalian name, being about 18 feet high, with

grand leafy covering, but of villainous flavour.—Rejected accordingly.

The Apios tuberosa.—American by birth, known to us more than three centuries, and almost naturalised in Austria and the north of Italy; admissible under the Foreign Enlistment bill, but not worth our possession, as it is found to skulk in holes and corners of hedges and copses, where its progeny does not exceed the size of an ordinary egg, after four years' growth. The tubers, in sober fact, are represented to be no larger than Nuts, when boiled, sweet like Chesnuts, woody in fibre, capricious in growth, and by no means nutritive—very unworthy to stand beside an Irish Lumper.

The *Psoralea esculenta*, from the banks of the Missouri, where the native Indians are said to feed upon its tubers, which are about the size of a pigeon's egg, covered with a very tough envelope. The inner part, however, which has a dry, farinaceous look, may be alimentary, but is so slow in growth, so tasteless, hard, and woody, even after some hours' boiling, that it, too, cannot be accepted.

Lathyrus tuberosus, which is not of American extraction, bears tubers externally resembling those of the preceding plant, over which it may possess some trivial advantages. It is indigenous to some parts of France, and is sold in some markets to children; but M. Mérat states also that after cultivation in his garden during four or five years, it showed little evidence of amelioration. The haulms of all these plants are useless as fodder; in this respect, however, they are not inferior to the Potato. "We see then," observes our author, "that of the preceding tubercules (all, excepting the Lathyrus, borrowed from America) there is not one capable of yielding aliment in any remarkable degree. If, as is alleged, some savage tribes feed upon these American tubers, what does this prove? That they have apparently no better means of sustenance. Do we not see them, in other regions of the globe, feeding upon even worse substances—swallowing unctuous clay, larvæ, insects, &c. Are we, therefore, to do the same, who possess excellent cereals, &c. Unless, indeed, long cultivation should produce on these roots offsets such as have attended the cultivation of the Potato we have nothing to expect from them. Genuine agriculturists must emphatically pronounce against them, and disabuse the public of illusions which can only be mischievous." He excepts from condemnation the Peruvian plant *Ulluco*, as possibly containing the qualities which, with culture, might fulfil at least some of the conditions necessary to qualify it to serve (but still imperfectly) instead of the Potato. In 1847 the French Minister of Agriculture distributed some tubers of the Ulluco to public garden establishments; and these tubers produced others similar to those of the parent plant—some underground and others axillary (and when the stem was losing its vitality), but both equally capable of reproducing. The Ulluco strongly resembles the Potato; the taste, however, of the former in the raw state is worse than that of the Potato in the same uncooked state; nor does it become well flavoured and farinaceous by boiling, however prolonged this process; on the contrary it only grows harder, and clogs and becomes watery and very disagreeable to the taste. This is the best of a bad lot, and though as the Solanum tuberosum was a tasteless root when first dug up from Sir Walter Raleigh's garden at Youghal, there is a possibility that the Ullucus tuberosus (distinguished from the Ullucus Kunthi, the Napi lissa of naturalists), might become presentable at table, if under the foregoing candid expressions of discouragement it were worth while to train and nurture it, the general opinion will probably be that it ought not to be placed on the muster roll of our esculents. M. Mérat is a decided admirer of the Potato—into the culture and malady of which he has fully and judiciously inquired in the course of his publication.

Miscellaneous.

Mr. Hutton's System of Cattle Feeding.—Mr. John Hutton, of Sowber Hill, near Northallerton, has been taking into hand, for some years, poor, wild, worn-out farms, as his tenants dropped, until he has about fifteen hundred acres or more, and has followed out the system of steam-boiling Linseed and meal, combining this with chaff, and so feeding a large number of cattle. He has thus renovated the poor, worn-out soils, and reduced the whole to a state of garden cultivation, combined with the successful feeding of prime short-horn steers. A party of some 29 agriculturists lately inspected his farming operations, and the clean, healthy, and happy condition of 50 well-fed short-horn steers, ready for market, the sleek and almost fat condition of the straw fold or store cattle in his yards—many worse are sold for fat—the healthy condition of his draught horses, are evidences of the value of the Linseed compound on which they are fed—the fat cattle to the utmost limit, and the store stock and horses once a day. To suit the expenses of the times the following is the formula of his feed, and, as will be seen, the cost of feeding is at this dear season not more than 6*s.* per week:—

Cost of keeping a Fat Beast for One Week.
April 18, 1854.

	s.	*d.*
26 lbs. of meal, at 1*d.* per lb. ...	2	2
13 lbs of Linseed, at 1½*d.* per lb. ...	1	7½
Turnips (from 70 lbs. to 80 lbs. per day) ...	1	6
Coals ...	0	1½
Labour on each beast ...	0	7
	6	0

The food given to the draught horses is 1 lb. of Linseed and 3 lbs. of meal, at noon, at the cost of 4½*d.* per day. The small quantity of roots per day—taking the minimum of 70 lbs.—would, in 20 weeks, amount to some 4½ tons only, thus finding all the roots necessary for feeding four cattle on 1 acre of a 20 ton per acre crop. *Journal of the Chemical Society.*

Calendar of Operations.

JANUARY.

Border of the Fens, *Jan.* 29.—A fortnight of frost and snow in January seems to be regarded generally with feelings of satisfaction, and if such weather should prevail for four or five weeks we should be reconciled by the expectation of enjoying favourable weather in the spring, to compensate largely for present severity; and we know that all heavy land will be greatly fertilised by the agency of frost if ploughed up a good depth, and, indeed, loamy soils also must derive much benefit from the same cause, if previously turned up. This may seem a truism not worth repeating, but we saw this morning two fields that occasioned this remark—one was a Wheat stubble, where no game is preserved, undisturbed since harvest, the other, a large piece of 30 acres, had been scarified and left with all the Grass and rubbish. Now we cannot but think this to be an abuse of scarifiers, as no doubt if such implements had not been in vogue this field would have been ploughed 5 or 6 inches deep, and would have been then better for all purposes than it now is; and in this instance the excuse of horses being otherwise engaged in the farm will not hold good. Yards are everywhere being emptied of manure, but the disposal of that manure varies very much; we before described our method, which we continue to practise, endeavouring to improve by varying the place of deposit, the quantity in each heap, and the degree of pressure applied to hasten or retard fermentation according to the stage of its decay and moist or dry condition. The object of all should be at this period of the year to make manure, whereas we see abundance of cases where manure is carted to arable and Grass fields direct from the yards, so that you see at one end of the field heaps of soiled straw, the colour scarcely changed, in another part dry friable dung, and elsewhere it may be, good manure of a dark colour. Stock of all kinds demand the greatest care and attention; shelter from wind in any quarter cannot be too much insisted on; beasts tied or shut up to fatten ought to lie warm, with sufficient ventilation, but store stock and young horses in yards with open hovels will generally be found to prefer the open yard, and should have liberty to take the air as much as they please, shelter being provided in case they want it, and to keep out draughts of wind, which do them as much harm as we should receive from sitting near an open door or window during cold weather. Jobbing labourers now find work rather scarce, as farmers can only just employ their regular hands, carting manure, or earth, or gravel being the staple occupations while the ground is covered with snow. Hedging furnishes something to do for one or two men, and improvements, where the tenure of a farm admits of their being made, will always be undertaken by improving tenants; roads are recommended by some, but roads are permanent improvements, and cannot be lightly undertaken without leases or some security for a return corresponding to the outlay; nobody denies the blessing of good roads, but some expectation of being remunerated must exist; for any man laying out money to benefit his successor without adequate advantage to himself is foolish, to say the least of it; and in farming, every man who has good-naturedly parted with his money knows full well how easy it is to lay it out, but with uncertain occupancy when will he see it again? Ordinary labourers now receive 13*s.* a week; Wheat 70*s.* per quarter; beasts make 8*s.* a stone; Linseed cake, 13*l.* a ton; pigs, 6*s.* 6*d.* to 7*s.* a stone; Barley-meal, 1*s.* to 1*s.* 2*d.* per stone; Potatoes, 8*s.* per sack of 2 cwt. *J. W., Peterborough.*

West Sussex, *Jan.* 30.—We have lately had a slight fall of snow with moderate frosts, which have been very seasonable, both for checking vegetation and allowing of our carting on the fields. There is no fear now of the Wheat being too forward; it will be in the very best state of progress to meet a favourable spring, and it will also be looking for a few April showers, for the land is very dry. I should think it has not been drier in the memory of man. At this time of the year, even on our clay lands, the ditches are dry as they were in the summer; and a few miles back among the downs water is getting expensive, being sold by the bucketful. And as the winter is now advanced without rain, fears are entertained about the supply next summer. Turnips are also checked in time; they were beginning to look rather green. They have kept better than we expected; many of them were rotted in the autumn, no more have gone since. The ewes and lambs have done well, as might be expected in this dry weather. The lambing season is nearly over. Fatting cattle do very well, they have 1¼ bushel of Swedes and Mangold Wurzel cut together, and given twice a day, and 5lbs. Linseed-cake and what hay they will eat, which is about 10lbs. each, and on this they do better than when they had three bushel Swedes and 4lbs. cake with hay *ad lib.* Peas are now being put in as the weather permits. And the little frost that we have had has been suitable for carting out dung to the fields. This with chalk carting, road mending, and the necessary barn work, is our present occupation. Wheat thrashing is far advanced, and our market has lately been well supplied. At another time I may give a description of our Chichester market, which for order and business-like system I believe is not surpassed by any county town in England. *G. S.*

Notices to Correspondents.

Boarding for Stalls: *Mr Young*, of Leeds, keeps his horses on boarded floors with some straw on them, and finds it a great economy in straw, and also advantageous to the health of the animals. He is an extensive livery stable keeper. He lays three ground sleepers (for a 6-feet width) the whole length of the stall, from wall to outside of gutter. They are of Larch or Oak 3 inches thick and 4 inches wide, and cross rails are nailed above them with what are called diamond nails—4 nails through into each sleeper. These cross boards are of Elm, 6 or 7 inches wide, 1½ to 2 inches thick, and from 1¼ to 2 inches apart, to allow the wet to get through.

Cow: *Liverpool.* We fear she is past all surgery. The mesenteric glands are probably diseased. The following may be tried:—Calomel, opium powdered, half a drachm each, to be given daily in thick flour gruel for four or five days. A few Beans and Rape-cake may be given with the food. *W. C. S.*

Dextrine: *Dextrine.* We presume the effect of the acid on the starch to be its conversion into dextrine, which if washed clear of the acid may no doubt be used as food. The freedom from acid will be ascertainable by taste.

Potatoes: *S F* says:—"I am preparing to plant a crop of Potatoes, and am very desirous to prove the principle of culture recommended by your correspondent "S.," Forfarshire, which appears to me very judicious. His four points I shall exactly observe; but as I feel anxious to carry out his system to the utmost, I would venture to ask him to state the depth he plants his Potatoes, and how the hoeing is effected."

Poultry Books: *T P.* Mr. Baily's address is Mount Street, Grosvenor Square. Your bookseller will obtain Tegetmeier's work.

Salt: *J A Carr.* Place a lump before her, and let her take as much as she chooses. That is the best way of determining the proper quantity.

Salt and Lime: *An Old Subscriber.* Chalk and salt should be just as efficient as lime and salt; in both cases time is needed for the assumption by the original mixture of the altered form of combination, to which its efficiency is due.

Water: *D C L.* Wind will not fill the wells except it be accompanied by water!

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" Pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to Waterer and Godfrey, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2*d.* stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their Patrons and the Public that their NEW CATALOGUE OF SEEDS for 1855 is now ready, and will be forwarded post free on application.

E. G. H. & Son take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list; and among the Flower Seeds only those whose beauty and merit are universally acknowledged, together with a carefully selected stock of the principal new varieties.

E. G. H. & Son beg respectfully to call particular attention to the following choice seeds of Florists' Flowers, which have been saved from a fine collection of named plants, and also to the annexed New and Choice Flowers, which they can confidently recommend, and in their Catalogue will be found the names of 20 beautiful ornamental Grasses. Also 12 variegated and ornamental foliage plants, for decorating the flower garden during the summer months, with full descriptions and other information respecting the following

CHOICE FLORIST FLOWERS.

Holcus Saccharatus (New Sugar Cane), 1*s.* and 2*s.* 6*d.*
Dioscorea Batatas (Japanese Yam), 2*s.* 6*d.* each tuber.
February 3.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, Mason and Builder, Pimlico Marble and Stone Works, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

"FRIGI DOMO," a Canvass made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of Emma Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey, and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

HOT-WATER PIPES at wholesale prices, with Elbows, Syphons, Tee Pipes, and every requisite connection. Cast Iron Boilers, 55s. each. Improved Soot Doors and Furnace Doors. Builders' Castings of every description kept in Stock at — Mr. LYNCH WHITE'S, Old Barge Iron Wharf, Upper Ground Street (near Blackfriars Bridge), London.

SHEET GLASS (15 oz.) of good quality in 100 feet boxes.

10 in. by 8 in. and under	... ...	15s. per box.
11 in. by 9 in. to 22 in. by 14 in.	... ...	17s. "
Larger sizes to 28 in. by 18 in.	... ...	19s. "

Also similar sizes in 21 oz. Sheet at 24s. per box. Boxes charged 2s. each, and returnable at the same price, if delivered free. CRYSTAL WHITE GLASS, Crown and Sheet Glass in Crates, British and Patent Plate, &c. &c. White Lead, Oils, Turpentine, Colours, &c.—G. Farmiloe & Son, 118, St. John Street, West Smithfield.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

HETLEY AND CO. are supplying 16-oz. Sheet Glass of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

Sizes.—Inches.		Inches.		Per foot.		Per 100 feet.
		Under 6 by 4	at	1½d.	is	£0 12 6
From 6 by 4		" 7 " 5	"	2d.	"	0 16 8
7 " 5		" 8 " 6	"	2¼d.	"	0 18 9
8 " 6		" 10 " 8	"	2½d.	"	1 0 10
10 " 8		" 12 " 9	"	2¾d.	"	1 2 11

Larger sizes, not exceeding 40 inches long.
16 oz. from 3d. to 3½d. per square foot, according to size.
21 oz. " 3½d. to 5d. " " "
26 oz. " 3¾d. to 7½d. " " "

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in sheet or Rough Plate Glass.

Propagating Glasses, Beehive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in Glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to James Hetley & Co., 35, Soho Square, London.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

6 by 4 and 6½ by 4½	... ...	10s. 6d. per box.
7 " 5 " 7½ " 5½	... ...	12 0 "
8 " 6 " 8½ " 6½	... ...	13 6 "
9 " 7 " 9½ " 7½ and 10 by 8	...	15 0 "

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2s. each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,
116, Bishopsgate Street Without.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

DOUBLE ITALIAN TUBEROSE ROOTS, 1s. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. Comiatti's Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

WOOLLEN NET FOR THE PROTECTION OF WALL FRUIT TREES FROM FROST, 2 and 3 yards wide, can be had of Weatherhead, Walters, & Co., Derby. See *Gardeners' Chronicle* of Oct. 28, 1854.

HALL'S GARDEN NETTINGS; the best and cheapest for all purposes of shelter and shade from Frost, Hail Storms, and Gales of Wind. No. 0, 5d.; No. 1, 5½d.; No. 2, 6d.; Nos. 3 and 4, 7d. All 56 inches wide, and in lengths of 10, 20, 30, and 60 yards.—Manchester.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1d. per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

BLOSSOM OF FRUIT TREES. — WORSTED NET to effectually protect the blossom of wall fruit trees from frost and blight, and the ripe fruit afterwards from wasps and flies, 7d. per square yard, in various widths. All kinds of garden, fishing, and sheep nets, made by machinery, and at very low prices.—R. Richardson, 21, Tonbridge Place, New Road, King's Cross, London.

THE WORSTED GARDEN NETTING.—1 inch Mesh, four stranded Worsted Netting, 2 yards wide, 5d. per yard; 4 yards wide, 10d. per yard. This is the lightest, neatest, and most approved article for protecting the bloom of Peach, Nectarine, and other Trees from frost or blight ever used. The Worsted Netting, if properly fixed, will resist more frost, and, with slight alteration, admit the air better than any other material.

Directions for fixing.—Run a cord in both edges with two yards of net to one yard of cord. Fix the top edge. Permanently attach a weight or tie down. The bottom edge at night will close the mesh. Let it loose in the morning, the mesh will expand, and admit air and light as required. See woodcut in *Gardeners' Chronicle* for Jan. 13th. I can fix the above like the cut at 1s. 8d. per yard, without poles.

SUPERIOR ELASTIC HEXAGON GARDEN NET, 76 Meshes to the square inch, effectually excludes Birds, Wasps Flies, &c., from Fruit Trees, Flower or Seed Beds.

GARDEN NETS, FISHING NETS, SHEEP NETS, AND RABBIT NETS (made by hand, as machine-made knots slip), supplied at very low terms. Samples sent free.

W. Cullingford, 1, Edmund Terrace, Ball's Pond Road, Kingsland, near the Gate, London.

Six Tents to sell cheap.—Old Tanned Nets repaired 5s. per 100 yards.

GALVANISED WIRE GAME NETTING.—7d. per Yard, 2 Feet Wide.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7d. per yd.	5d. per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by Barnard & Bishop, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

GARDEN ORNAMENTS.—Several Hundreds of VASES, FIGURES, and SUN-DIAL PEDESTALS, which have stood wholly exposed to the late frosts, may now be inspected at

AUSTIN AND SEELEY'S Show Yard,
Keppel Row, New Road.

☞ A few articles which have been standing as patterns for many years will be sold at reduced prices. Any gentleman unable to visit the yard may have sketches sent, if he will describe the object required, and the price.

MOORE'S PATENT VENTILATORS FOR CONSERVATORIES, HOTHOUSES, ETC.

JAMES VEITCH, Jun., fully impressed with the correct principle of ventilation for Plant Houses, &c. afforded by MOORE'S PATENT VENTILATORS, has had a house fitted up with them at Chelsea, which it will be a pleasure to him to show to any persons visiting his Nursery.

For the admission of air, in upright sashes, he believes it to be the most complete and best plan at present in use. In appearance it is neat and elegant, easily worked, and not liable to get out of order; but what is of far more consequence than this, these Ventilators admit the air in such a manner that they can be used in all weathers, and with them the admission of air is so under command that plants cannot fail to be benefited by their adoption.

James Veitch, Jun., *desires it to be fully understood that he has no personal interest whatever in the adoption of the above Ventilators, but believing them to be a decided improvement on all other plans, he is desirous of giving the public an opportunity of seeing and judging for themselves.*—Exotic Nursery, Chelsea, Feb. 3.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 30s. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel,	Length of Barrel, under nose.		£ s. d.
2½ in. short	1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12
2½ " long	3 " 3 "		1 15
3 " ditto	3 " 6 "		2 12
3½ " ditto	3 " 6 "		2 15
4 " ditto	3 " 6 "		3 5
2½ " short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2 12
2½ in. long ditto	ditto	ditto	2 15

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

AT MR. MECHI'S ESTABLISHMENT, 4, Leadenhall Street, London, are exhibited the finest specimens of British Manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury suitable for presentation. A separate department for Papier Mâché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c., as usual. Shipping orders executed for merchants and captains. An extensive assortment of superior Hair and other Brushes for the Toilet.

GLASS.

THOMAS MILLINGTON, Importer of Foreign Sheet Glass, requests attention to the present Prices of Glass and Stock sizes, which are cheaper and better than those of English manufacture:—

Scion, choice and arrangement of
Stock, preparation of.

APPENDIX.

A selection of varieties
Comparison between budding and grafting.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

NOTICE.—NO CHARGE FOR WATERPROOFING.

OVER-COATS, CAPES, &c.—One of the largest stocks in London of every description, first-class garments, at lowest charges; also of Youths' ditto, all made thoroughly impervious to rain, without extra charge, or made to order at a day's notice.—W. BERDOE, 96, New Bond Street, and 69, Cornhill (only).

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, &c.?—COUPELLE'S CRINUTRIAR, though extensively imitated, is universally acknowledged as the only preparation to be really depended upon for the unfailing production of Hair and Whiskers in two or three weeks; as also checking Greyness, Baldness, &c., and rendering the Hair beautifully luxuriant, curly and glossy. Mr. WILLIAMS, 8, Lowther Street, Liverpool.—"I can now show as fine a head of hair as any person, solely from using your Crinutriar." Sergeant CRAVEN, Longford Barracks, Ireland.—"Through using your Crinutriar, I have an excellent Moustache, which I had before despaired of." Mrs. CARTER, Pangbourne, Berks.—"My head, which was quite bald, is now covered with new hair." Price 2*s.* per package, through all Druggists and Perfumers, or sent post free on receipt of 24 penny stamps by ROSALIE COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2*s.* per Package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

HOLLOWAY'S OINTMENT AND PILLS HAVE EFFECTED ANOTHER CURE OF BAD LEGS.—Mr. Mason, Chemist, of Hastings, states in a letter to Professor HOLLOWAY, that a relation of his, residing in Goodwin Street, Bloomsbury, Birmingham, was for several years affected with Bad Legs; he applied a variety of remedies, but to no purpose, as the wound increased to an alarming extent. However, at last he tried Holloway's Ointment and Pills, and by the use of these never-failing medicines the virulence of the disease was quickly subdued, and, by persevering with them for a time, they effected a sound and permanent cure.—Sold by all Vendors of Medicine; and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

FURNISH YOUR HOUSE WITH THE BEST ARTICLES AT DEANE'S IRONMONGERY AND FURNISHING WAREHOUSES. Established A.D. 1700. A Priced Furnishing List, free by post.—DEANE, DRAY & Co. (Opening to the Monument,) London Bridge.

HOT-AIR, GAS, VESTA, JOYCE'S STOVES.—STOVES for the economical and safe heating of halls, shops, warehouses, passages, basements, and the like, being at this season demanded, WILLIAM S. BURTON invites attention to his unrivalled assortment, adapted (one or the other) to every conceivable requirement, at prices from 10*s.* each to 30 guineas. His variety of register and other Stoves, Fenders, and Kitchen Ranges is the largest in existence.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS devoted to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

THE COMFORT OF A FIXED WATER-CLOSET FOR 1*l.*—Places in gardens converted into comfortable water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & Co.'s Sanatorium, 46, Leicester Square, London.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

ASTHMA, COUGHS, COLDS, AND INFLUENZA SPEEDILY CURED, AND INSTANTLY RELIEVED BY THE USE OF SPENCER'S PULMONIC ELIXIR.

This fine medicine will be found admirably adapted to promote expectoration, ease the breathing, loosen the phlegm, abate fever, and allay the tickling sensation which occasions the cough, without tightening the chest; and for all temporary and local affections, such as wheezing, irritation of the throat, palpitation of the heart, hoarseness of the voice, influenza, &c., it affords immediate relief; while in more chronic disorders, as periodical coughs or inveterate asthma, it is equally valuable in its effects, although of course a little longer perseverance in the use of the article is required.—Prepared only by T. ROBERTS & Co., Crane Court, Fleet Street, London; and by all respectable medicine-vendors and chemists in the kingdom. In bottles at 1*s.* 1½*d.* and 2*s.* 9*d.* each; the bottles at 2*s.* 9*d.* contain nearly as much as three small ones.

*** Ask for SPENCER'S Pulmonic Elixir.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL, prepared for MEDICINAL USE in the LOFFODEN ISLES, NORWAY, and put to the test of Chemical Analysis.

This pure and unadulterated, transparent, light brown Cod Liver Oil, long known and justly appreciated on the Continent, has now acquired the general confidence of the Medical Profession in this country, by whom it has been extensively and successfully prescribed, and with almost immediate and remarkably beneficial results—in many instances where ordinary Cod Liver Oil had been copiously, though ineffectually administered.

It owes its superior efficacy not only to its method of preparation, but to the fact—clearly established by chemical analysis and therapeutic experiments—that the liver of the species of cod fish from which it is exclusively procured naturally contains a larger quantity of iodine, of the elements of the bile and other essential remedial properties, than is found in other kinds of the GENUS GADUS. It is of the finest quality, free from any admixture, or the usually repulsive, sickly, and nauseous flavour or after-taste of the Pale Oils, or of the coarse Brown Oil, commonly sold, though totally unfit for medicinal purposes.

Being sold by IMPERIAL MEASURE it is as low in price per ounce as any other genuine Cod Liver Oil, whilst its regular and speedy effects render it incalculably cheaper. Medical and Scientific Testimonials of the highest character delivered or forwarded, GRATIS, on application to Dr. de Jongh's Sole Agents and Consignees, ANSAR, HARFORD, and CO., 77, STRAND, London, by whom the Oil is sold wholesale and retail, in bottles capsuled and labelled with Dr. de Jongh's stamp and signature, and in THE COUNTRY by respectable Chemists and Vendors of Medicine. Where difficulty occurs in procuring the Oil, four half-pint bottles will be forwarded to any part of England, CARRIAGE PAID, on receipt of a remittance of 10*s.*

Half-pints (10 ounces), 2*s.* 6*d.*; Pints (20 ounces), 4*s.* 9*d.*; Quarts (40 ounces), 9*s.*

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All Sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last eleven years, and is applicable to every kind of single and double Rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7*s.* 6*d.* in postage stamps, cash, or Post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 3 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

NEW WINTER SOAP.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d.* each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

TO PARENTS AND GUARDIANS.—The return of youth to the respective boarding-schools induces a solicitude for their personal comfort and attraction. Now it is that ROWLANDS' MACASSAR OIL, for accelerating the growth and for improving and beautifying the hair, ROWLANDS' KALYDOR, for improving the skin and complexion, and removing cutaneous eruptions, and ROWLANDS' ODONTO, or PEARL DENTRIFICE, for rendering the teeth beautifully white and preserving the gums, are considered indispensable accompaniments for the attainment of those personal advantages so universally sought for and admired. Beware of Spurious Imitations. The only Genuine of each bears the name of ROWLANDS' preceding that of the article on the wrapper or label.—Sold by A. ROWLAND and SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

MESSRS. SHOOLBRED AND BRADSHAW, 34, Jermyn Street, PATENTEES. Manufacturers of every description of ELASTICAL SURGICAL BANDAGES, as recommended by all the most eminent surgeons, in acknowledging the very extensive support they have received, beg to call attention to the various improvements they are making in patent Elastic Stockings, Knee Caps, Socks, and Ladies and Gentlemen's Spine Supporters. A new description of Belt, invaluable for prevention of Cholera and the cure of Rheumatism, Lumbago, &c. N.B. Every description of India-rubber Bandages vulcanised on the newest principle.

BASS'S EAST INDIA PALE ALE. BARCLAY'S PORTER AND STOUT, in 18 Gallon Casks, Bottles, Half-Bottles, and Imperial Pints.

BERRY, BROTHERS, & Co., 3, St. James's Street, London.

LIQUID AMBER.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price, and height, to Mr. JEYES, Nurseries, Northampton.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 16*s.* per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and loam at moderate prices.—KENNARD, BROTHERS, Swan Place, Old Kent Road.

WANTED TO RENT, from Lady Day, a SMALL FARM near London. A good House is required, with 40 to 100 acres of Land (Arable and Pasture), and the requisite Outbuildings; and within 25 miles from town.—Apply, by letter, to the Editor of the *Agricultural Gazette*, 5, Upper Wellington Street, Strand, London.

WANTED, about Lady-day next, in a strictly single-handed place, where a cow is kept and assistance only given occasionally in mowing and weeding, a very active and industrious Man, as GARDENER, who is well acquainted with the duties of his calling, and has a decided taste for flowers. He will have the care of a Conservatory, Greenhouse, and Stove, on a small scale; in addition to a Flower-garden on the "bedding-out" plan, with a walled Fruit and Vegetable garden. No one need apply whose character and abilities will not bear the strictest investigation, or who is not a member of the Church of England, unless a Scotch Presbyterian. Wages 16*s.* a week, with a house free if a married man.—Letters to be addressed to A. B. C., Post Office, Kingsbridge, Devonshire.

NURSERY AND SEED BUSINESS,

ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station. Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

TO BE SOLD, the BUSINESS, GREENHOUSES, PITS, FRAMES, and STOCK therein, containing a choice collection of Plants in the finest condition; also the Lease of the ACACIA ROAD NURSERY, situated in the best part of St. John's Wood, and close to the Regent's Park. There is an excellent Residence, with Stable, Coach, and Potting-houses. Well worthy the attention of any person wishing to carry on the business. A part of the purchase money may remain on security if required. Further particulars may be obtained of the proprietor, ROBERT YEO, Esq., 10, Victoria Terrace, Belsize Road, St. John's Wood, London.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. FOX'S, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

DORKING FOWLS.—Eggs, from remarkably large and weighty birds, of the best coloured breed, will be disposed of at 15*s.* the dozen, box included.—Address W. G., Railway Inn, Holme, Stilton, Hunts.

POSTPONEMENT OF SALE.

MR. J. WILLMER begs to announce that the Sale at the Sunbury Nursery is in consequence of the inclemency of the weather postponed till the 13th and 14th of February, at 12 o'clock precisely each day.—Further particulars and Catalogues had by enclosing two postage stamps to Mr. J. WILLMER, Auctioneer and Valuer, Sunbury, Middlesex.

BROMPTON PARK NURSERY.

TO GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to an unreserved Sale by Auction, on the premises, the Brompton Park Nursery, Brompton, near the "Hoop and Toy," on MONDAY, February 5, at 11 for 12 o'clock precisely, by order of the Royal Commissioners for the Exhibition of 1851, in consequence of the land being required for the formation of new roads, a portion of the valuable Stock growing on the above celebrated Nursery, consisting of FRUIT TREES and EVERGREENS, comprising Standard and Dwarf trained and untrained Apple, Pear, Plum, Peach, Nectarine, Apricot, Cherry, a quantity of Vines, Clematis, and Ivies in pots, Rhubarb, &c.—May be viewed three days prior to the Sale. Catalogues may be had of the principal Seedsmen in London, and of the Auctioneers American Nursery, Leytonstone, Essex.

PETER LAWSON AND SON,

QUEEN'S SEEDSMEN, WOOD FORESTERS, &c., FOR SCOTLAND,

AND TO THE HIGHLAND AND AGRICULTURAL SOCIETY.

1, George IV. Bridge, Edinburgh; and 27, Great George Street, Westminster, London.

THE following is a List of new and extremely rare and valuable CONES and SEEDS of CONIFERÆ and other Plants, all hardy, and suited for cultivation in this country; forming the most interesting Collection ever brought to Europe. They were gathered, with great care and discrimination, in October last, in North-West America, and have been received in the best condition. The collector, a gentleman devoted to Natural Science, is presently preparing a Memoir of his Expedition, which will shortly be read before the Botanical Society of Edinburgh, and afterwards, with the permission of that body, published, with drawings, &c., in some of the leading Journals. Some of the species have been described, and are known to scientific men, and have also been introduced, but in very limited quantities, by the Horticultural Society of London and the Oregon Expedition; still, from their extreme rarity, their general appearance and value are very little known in this country. We append, therefore, a short description of each from some established authority, where such can be obtained. We place the Cones and specimens of Leaves, &c., at the disposal of a few learned Societies and Museums, and shall be happy to divide the remainder among purchasers of the Seeds, free of charge; but there are so very few, that, except to very early applicants, we cannot recommend any dependence to be placed on this offer. The consignment being limited, we must ask the favour of immediate commands, which will be duly and faithfully executed in the order in which they are received. To our ordinary Customers the usual credit will be given; but unknown Correspondents are requested to favour us with a reference. In all cases 5 per cent. will be allowed for cash, which may be remitted by Post Office Orders, Bankers' Cheque, or otherwise.

LIST OF NEW AND RARE CONIFERÆ.

1. PINUS NOBILIS, Dougl. (Noble Silver Fir). A noble tree, justly so named by the discoverer. It is as majestic in form as the Araucaria imbricata. According to Douglas, it forms vast forests on the mountains of northern California, and along the river Columbia, where it attains a great height, and produces excellent timber. It is quite hardy, and is a crowning beauty of Pinetums. Seedling plants are very rare in Europe. (SYN.—Abies Nobilis, Lindl. Picea nobilis, Loud.) Entire Cones, as gathered from the trees, each 5*l.*
2. PINUS GRANDIS, Dougl. (Great Californian Silver Fir). A native of northern California, where it grows in low moist valleys, and attains the height of from 150 to 200 feet. This noble tree has beautiful shining green leaves, is quite hardy, but very rare in this country, especially seedling plants. (SYN.—Abies grandis, Lindl. Picea grandis, Loud.) Entire Cones, as gathered from the trees, each 5*l.*
3. PINUS LAMBERTIANA, Dougl. (Lambert's Pine). This giant of vegetable production attains upwards of 200 feet in height by 60 feet in circumference. It is found on mountains in lat. to 42° lat. in North-West America, at a distance of 100 miles from the sea. It attains its greatest height in soil consisting of pure sand, where it perfects its seeds, which are large and used as food. It has a clean stem for two-third parts of its entire height, terminating in an open pyramidal head. Branches in whorls, rather pendulous; bark smooth, of a light brown; leaves 4 to 5 inches long, of a grass-green colour. Cones often 12 to 16 inches long by 12 inches in circumference, rather tapering and drooping on coming to maturity, although upright at first. The timber is white, soft, and light, exuding a resin which, when roasted, is used as a substitute for sugar by the natives. Hardy, but rare as seedlings in this country. 50 clean seeds, quite fresh, 1*l.* 5*s.*
4. PINUS TUBERCULATA. Growing at an elevation of 5000 feet; very little known. Cones containing seeds, in fine order, each 2*l.* 2*s.*
5. PINUS MONTICOLA, Dougl. (Mountain Weymouth Pine). A tree of great height, inhabiting the high mountains near the cataracts of Columbia, North-west America. It has a slight similarity to the Cembra Pine of Siberia, but is smoother in the leaves, and grows twice as fast. Cones 6 to 8 inches long, cylindrical, smooth, generally growing in whorls from the axils of the verticillate-standing branches. Hardy seedling plants are very rare in this country. 50 picked seeds, quite fresh, 2*l.* 2*s.*
6. PINUS JEFFREYI, Oregon Committee. A magnificent hardy tree about 150 feet high and 4 feet in diameter, found in Shasta valley, North California, by Jeffrey. The seeds of this lot are in fine order; plants of this truly valuable tree are very scarce in this country. Cones with seeds, each 3*l.* 3*s.* 50 picked seeds, 2*l.* 2*s.*
7. PINUS, new Sp. (provisionally named P. Beardsleyi). The tree is of great beauty and size; one which was cut down measured 123 feet in height, and 44 inches in diameter at the stump. Another tree near it measured 17 feet 4 inches in circumference at three feet from the ground. The stem was a very handsome column, about thirty feet to the first branch; timber good and clear. It was found on the top of the mountain, same altitude as P. Jeffreyi, Monticola, and grandis, and higher than Benthamiana or Lambertiana. Cones with seeds, each 2*l.* 2*s.*; 50 picked seeds, 2*l.* 2*s.*
8. PINUS, new Sp. (provisionally named P. Craigiana). This tree in its growth somewhat resembles the preceding. It was found upon the same mountain, about a quarter of a mile farther down. The prickle on the cone points toward the tip, while that on the preceding cone points backwards. Cones with seeds, each 10*l.*; 50 picked seeds, 2*l.* 2*s.*
9. ABIES, new Sp. (provisionally named Abies Hookeriana). A new species allied to A. Pattoniana, but quite distinct, and, like it, a tree of exceeding beauty and gracefulness. The height was about 50 feet; 20 inches in diameter at the stump. It was growing at a great altitude, and surrounded by snow on 16th October. Timber hard and tough. 6 cones with seeds, 3*l.* 3*s.*; 50 picked seeds, 2*l.* 2*s.*
10. PINUS, new Sp. (provisionally named Pinus MacIntoshiana). Of this, only one tree, about 15 feet high, was found; and of the few cones upon it every one was secured. Cones with seed, each 5*l.*; 25 picked seeds, 2*l.* 2*s.*
11. THUJA CRAIGIANA, Balfour (Libocedrus decurrens, Torrey). Lindley says this is a "Magnificent new species." It is characterised by its curiously compressed branchlets, and imbricated shining boat-shaped leaves; tree 40 feet high by 3 in diameter, timber very durable. 100 seeds, 2*l.* 2*s.*; 50 ditto, 1*l.* 5*s.*
12. CUPRESSUS, new Sp. (provisionally named Cupressus Lawsoniana). This was the handsomest tree seen in the whole expedition; and it is a subject of much regret that it was found impracticable to obtain more than a very few seeds. It was found on the banks of a stream in a valley on the mountains; is about 100 feet high, and 2 feet in diameter; the foliage is most delicate and graceful. The branches spread upwards like a Spruce, and hang down at the tips like an ostrich feather—the top shoot drops like a Deodar. The timber is good, clear, and workable. Seeds, each 5*l.*
13. CUPRESSUS, new Sp. (provisionally named Cupressus MacNabiana). This appears to be the same as one introduced by Jeffrey. Seeds, each 10*s.* 6*d.*
14. TAXUS (? new Sp. provisionally named Taxus Lindleyana). A true Yew; 5 feet 10 inches round the base; was growing well under taller trees; and would, consequently, make a good filler-up where ordinary underwood does not readily grow. Wood admirably adapted for every purpose requiring hardness and elasticity. Used by the aboriginal Indians of the interior for bows and shafts of weapons. 50 seeds, 2*l.* 2*s.*
15. JUNIPERUS (probably the same as one introduced by Jeffrey). Seeds, each 5*s.*
16. PINUS BENTHAMIANA, HARTWEG. (Bentham's Pine). A noble Pine, attaining more than 200 feet in height, by 28 feet in circumference; found on the mountains of Santa Cruz, and others in California, ranging above P. Sabiniana, and in some places associated with P. Lambertiana. Branches numerous, large, spreading, rather irregular, covered with a rough bark. Leaves thickly set on the branches, dark green, usually 11 inches long, strong, rather flat, with a slightly elevated mid-rib on the inside. Cones 6 inches long, ovate, conical, straight, leaning, sessile, in clusters by three and four together. As it is quite hardy, it is likely to prove a valuable timber tree in this country. Decidedly one of the most ornamental of Conifers. Seedling plants still very rare in this country. 12 seeds, 2*l.* 2*s.*
17. ABIES DOUGLASI, var. religiosa. The cones of this variety are more ovate than the species, and the leaves broader, longer, and of darker green. 6 seeds, 10*s.* 6*d.*

LIST OF NEW AND RARE MISCELLANEOUS SEEDS.

18. ASH (supposed to be new), 12 seeds, 10*s.*
19. BIRCH (supposed to be new). Packet of seeds, 7*s.* 6*d.*
20. MAPLE (supposed to be new). Of remarkably rapid growth, some of this year's shoots are of an immense length; 6 seeds, 7*s.* 6*d.*
21. AZALEA (white). Packet of seeds, 7*s.* 6*d.*
22. DARLINGTONIA CALIFORNICA. This new Sarracenia has never yet been introduced into either this country or the Continent, and was only first described in the Smithsonian Contributions to Knowledge last year. Small packet of seeds, 5*s.*
23. LILIACEÆ (no name). Found growing in marshy places on the banks of Trinity River; height, 7 to 8 feet. Packet of seeds, 2*s.* 6*d.*
24. TULIP TREE (supposed to be new and distinct. Seeds, each, 1*s.*
25. CERASUS, sp. (GRAPE CHERRY). A hardy shrub, with large leaves, and edible berries, about the size of Frontignan Grapes. Seeds, each, 1*s.*
26. ERICACEÆ (MANZANITA). The Indians use this berry as food in the shape of meal, first separating the seeds. Seeds, each, 1*s.*
27. CLEMATIS, species found on the banks of Swift Creek. Packet of seeds, 2*s.* 6*d.*
28. GRANDMAMMA'S VALENTINE. Swift Creek. Seeds, each 1*s.*
29. SPIGNET. 12 seeds, 3*s.*
30. BRYONIA, Sp. Creeper. 12 seeds, 3*s.* 6*d.*
31. YELLOW EVERLASTING. Seeds, per packet, 2*s.* 6*d.*
32. BLACK FRUIT, about the size of Quince. Seeds, each, 1*s.*
33. CLEMATIS, Sp. Seeds, each, 1*s.*
34. BERBERIS MURRAYI (Mahonia). Very fine. Seeds, each, 2*s.* 6*d.*
35. LINUM, Sp. Seeds, each, 1*s.*
36. ROSA, Sp. Seeds, each, 1*s.*
37. PLATANUS, Sp. Seeds, each, 2*s.*
38. SAMBUCUS, Sp. Small foliage. 12 seeds, 2*s.* 6*d.*
39. CERASUS (Laurel). 12 seeds, 4*s.*
40. RHUS VIRIDIFLORA (the Yedra poison). Seeds, packet, 2*s.*
41. MATRICARIA. (A new Camomile). Very bitter, used as medicine. Packet, 2*s.*
42. VIBURNUM, Sp. From the Sacramento. 12 seeds, 4*s.*
43. LILIACEÆ, Sp. From the Sacramento. 12 seeds, 4*s.*
44. ERICACEÆ, Sp. from Harrison's Traps. 12 seeds, 4*s.*
45. LUPINUS, Sp. Blue true sort. 12 seeds, 2*s.*
46. GNAPHALIUM, pure white. Packet of seeds, 4*s.*
47. COTONEASTER, Sp. Seeds, each, 1*s.*
48. LONICERA, Sp. Trinity Mountain. 12 seeds, 6*s.*
49. PAPAVERACEÆ, Sp. Very large pods. Packet of seeds, 2*s.* 6*d.*
50. PYRUS, Sp. 12 seeds, 4*s.*
51. A species of CEANOTHUS (probably thyrsiflorus). In packets, 1*s.* and 2*s.*
52. A very beautiful velvet-leaved blue TREE LUPINE. Packet, 2*s.* 6*d.*
53. A yellow TREE LUPINE, in habit like the Laburnum, both in growth and abundance of flowers, which possess an agreeable fragrance. Packet, 2*s.*
54. NUTTALLIA CERASIFORMIS. A beautiful hardy border plant, with bay-like leaves, and small stone fruit like a Cherry. Packet, 1*s.* 6*d.*
55. A beautiful climbing CUCURBITACEOUS PLANT, allied to Sicyos, with large seeds, contained in a spiny capsule. Packet, 1*s.* 6*d.*
56. CLUB-HEADED WHEAT, cultivated by the old Californians, 200 seeds, 20*s.*
57. WHEAT (a variety of Triticum durum), with solid stalks 200 seeds. 15*s.*

EXPECTED SHORTLY, CONSIGNMENTS OF PINUS CEPHALONICA AND P. PINSAPO, VALONIAN OAK, ARAUCARIA IMBRICATA, AND CRYPTOMERIA JAPONICA, which, if received in good order, will be offered for sale as under:—

58. PINUS CEPHALONICA ...	... per 100 seeds	£0	2*s.*	6*d.*
59. „ PINSAPO	... „	0	7	6
60. ARAUCARIA IMBRICATA	... „	2	10	0
61. CRYPTOMERIA JAPONICA	... „	0	5	0
62. VALONIAN OAK	... per dozen	0	1	0

In the meantime, we shall be happy to receive orders, to be executed on arrival of the Seeds.

Note.—The small seeds can easily be forwarded by post; but where the Cones are ordered, the mode of transit must be distinctly stated. The seeds being fresh, will, it is expected, germinate readily; but for the information of those not having a gardener to treat them in heat, a cold frame, or even a sheltered spot in the open air will do perfectly well, though they may take longer to spring. The soil should be lightish, and care taken to prevent excess of moisture.

MELVILLE'S HARDY SCOTCH BROCCOLI *will stand the most severe winter, and therefore invaluable.* 100 Seeds for 1*s.*

For full description, see "RENDLE'S Price Current and Garden Directory for 1855."

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MELVILLE'S TREBLE CURLED GARNISHING BORECOLE.—*This is the choicest and most useful Vegetable for garnishing ever introduced, and should be grown in every garden.* 200 Seeds for 1*s.*

For description see "RENDLE'S Price Current and Garden Directory for 1855."

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MELVILLE'S NEW INTERMEDIATE HYBRID CABBAGE.—*This is a valuable addition to our stock of Vegetables, and should be had by all who have gardens.* 200 Seeds for 1*s.*

For description see "RENDLE'S Price Current and Garden Directory for 1855."

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s.* per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s.* per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s.* per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

RANUNCULUSES, ANEMONES, LILIUM LANCIFOLIUM, CALOCHORTUS LUTEUS, CALLIPRORA FLAVA, GLADIOLUS, TRITONEA AUREA, DIELYTRA SPECTABILIS, VALLOTA PURPUREA, ANOMATHECA CRUENTA, AND AURICULAS.

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY, begs to say that he has a fine Selection of the above BULBS, &c., which he can supply at Moderate Prices. His Catalogue will be forwarded on application.

PYRAMIDAL PEAR TREES,
GRAFTED ON THE QUINCE STOCKS.

J. AND J. FRASER have still to offer strong trees of the above PEARS: a Descriptive Catalogue of the sorts may be had on application. To prevent disappointment early orders are requested, as the Stock of some of the varieties is getting low.—The Nurseries, Lea Bridge Road, Essex.

LAURELS AND ROSES.

DAVID FERGUSON, LANDSCAPE GARDENER and CONTRACTING PLANTER, Stowe, Buckingham, in answer to inquiries, begs to state that he has good LAURELS for laying, 1 foot to 4 feet in height, at 1*l.* to 3*l.* per 1000, if 10,000, 20,000, 50,000, or 100,000 are taken.

Fine RED GIANT DES BATAILLES and other ROSES, 4*l.* per 100, or 35*l.* per 1000.

DWARF BUDDED, on the WILD ROSE, 2*l.* per 100, or 17*l.* per 1000.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their Stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out.

Their Seeds may be fully relied on as being in every respect of first-rate quality, and true to their sorts. Catalogues may be had on application.—Pine Apple Place, Edgeware Road, London.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s.*; 12 varieties, 2*s.* 6*d.*; and from good double sorts, 1*s.*

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s.* per packet; separate, 2*s.* Fine Quilled African Marigolds, 6*d.* per packet.—Saffron Walden Nurseries.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.

J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).

CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

DR. SYNTAX CUCUMBER.—The above celebrated variety has been nearly lost to gardeners for several years past. It is known by all experienced growers of Cucumbers to be the very best sort in existence for early work.

A paper sent free per post on receipt of 13 stamps.

SNOW'S HORTICULTURAL BROCCOLI.—Half-ounce Packet sent free per post on receipt of 24 stamps.

NORTHAMPTON MARKET BROCCOLI.—This variety is grown by the market gardeners here, and excites the admiration of all who see it. Visitors say "they never saw such Broccoli anywhere else." Half-ounce Packets sent free per post for 14 stamps.—JOHN JEYES, Nurseries, Northampton.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, February 3, 1855.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

SCOTTISH ARBORICULTURAL SOCIETY.—The Society have agreed to offer Prizes (open to all) for ESSAYS on the following branches of Practical Forestry; the Essays to be, in every case, founded on the experience of the author:—

I. DRAINAGE | II. PRUNING | III. THINNING
IV. STRIPPING AND CURING OF OAK BARK.

Essays intended for competition must be sent to Mr. JAMES ALEXANDER, 1, Waterloo Place, Edinburgh, the Secretary, on or before 1st of August, 1855, each bearing a certain motto, and accompanied by a separate sealed letter, bearing the same motto, and containing the name and address of the author.

The Society also invite communications on subjects connected with Forestry, for which special prizes are not offered.

The Laws of the Society, and other information may be obtained on application to the Secretary, as above.

TO THE MEMBERS OF THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—ELIZABETH CURTIS begs to return her grateful thanks to all the members who so kindly favouring her with their votes, have enabled her to become a Pensioner of the above Institution.—Clapham, Feb. 10.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.
** Plans and Estimates furnished.

DAVID FERGUSON, LANDSCAPE GARDENER and CONTRACTING PLANTER, Stowe, Buckingham.

CEMETERIES.

WILLIAM MASTERS AND SON having been engaged upon extensive Cemetery works, are prepared to undertake the LAYING OUT and PLANTING NEW GROUNDS, as well as the Ornamenting such as are closed by the recent Act of Parliament, by contract or otherwise.—WILLIAM MASTERS & SON, Landscape Gardeners, Canterbury.

NOTICE OF REMOVAL.

WILLIAM HILL, HORTICULTURAL SURVEYOR, BUILDER, and HOT-WATER ENGINEER, late of Greenwich, respectfully requested to be addressed.—Streatham Hill, Surrey.

R. PARKER begs to offer the following:—CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Strong established plants, in 4-inch pots, at 4*s*. per dozen. A choice collection of named Cinerarias in strong established plants, purchaser's selection, at 9*s*. per dozen.

ROSES, consisting of the best varieties of Hybrid Perpetuals, Teas, Bourbons, &c., well established in pots. Purchaser's selection, at 12*s*. per dozen. List of names forwarded upon application.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

PRESENT PRICES OF AGRICULTURAL SEEDS.—SEE MESSRS. SUTTON'S DESCRIPTIVE LIST, on the last page of this day's *Gardeners' Chronicle*.

SUTTON'S SHORT SEED LIST.

SUTTON'S SHORT SEED LIST, *containing only the most desirable sorts, will be sent post free, in return for one penny postage draft or receipt stamp.*
SUTTON & SONS, Seed Growers, Reading, Berks.

BASS AND BROWN'S SEED AND PLANT LIST FOR 1855, sent free by post for three penny stamps.
It contains as usual a large number of the most attractive and popular new articles, with much descriptive and useful information.
The AUTUMN PLANT LIST also for three penny stamps.
BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

MESSRS. J. AND H. BROWN'S NEW PRICED CATALOGUE can be had by post. American Plants, Coniferæ, Orchidea, Stove and Greenhouse Plants, Fruit Trees, &c. A separate List of Garden and Flower Seeds.
Albion Nursery, Stoke Newington, London.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

DOWNIE AND LAIRD beg to intimate that their NEW LIST of FLORIST FLOWERS, &c., for 1855, is now ready, and may be had on application.—17, South Frederick Street, Edinburgh, Feb. 10.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.
P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

PETER LAWSON AND SON, the QUEEN'S SEEDSMEN, &c., Edinburgh, respectfully intimate that they are supplying their English customers and the public, at their London Establishment, 27, Great George Street, Westminster, with VEGETABLE and FLOWER SEEDS of the best description, and at moderate prices. Catalogues may be had on application.
27, Great George Street, Westminster, Feb. 10.

PERENNIAL RYE-GRASS SEED.

STUART AND MEIN, SEED MERCHANTS, Kelso, have on hand 50 quarters of good PERENNIAL RYE-GRASS SEED, about 15 lb. per bushel, which they can sell at a moderate price.—Apply, with reference, pre-paid, as above.

CAMELLIAS.

CHANDLER AND SONS beg to inform their friends and customers, that they have a large stock of young CAMELLIAS this season, now coming into flower, and in a fit state to travel without injury. Fine plants well set with buds, 3*s*. 6*d*. to 5*s*. and upwards each.—Wandsworth Road, Vauxhall.

JOHN DOBSON AND SON'S SEED CATALOGUE FOR 1855 may be had on application, enclosing one stamp.
Woodlands Nursery, Isleworth.

JOHN DOBSON AND SON will have much pleasure in forwarding their NEW GENERAL CATALOGUE OF FLORISTS' FLOWERS, on receipt of one stamp for postage.
Woodlands Nursery, Isleworth.

PHLOX OMNIFLORA COMPACTA, New White Phlox. The above is strongly recommended for bedding purposes, being very dwarf. Strong plants in March, price 3*s*. 6*d*. each. Further particulars may be had on application to JOHN DOBSON & SON, Woodlands Nursery, Isleworth.

GRAPE VINES FROM EYES.

R. GLENDINNING has a large Stock of the undermentioned Vines, extra strong in pots, with well ripened wood, 5 ft. and upwards in the canes. Some of the kinds are new, and which have been proved and found of first-rate quality:—

Black Hamburgh	Cabul
The Pope's Hamburgh	Gromier du Cantal
Wilmot's Hamburgh	Welbeck Tripoli
Mill Hill Hamburgh	Grove End Sweetwater
Victoria Hamburgh	Pitmaston White Cluster
Barnes's Muscat	Chasselas Musqué
Reeves's Muscadine	Black Prince
Raisin de Calabre	Muscat non de jura
White Frontignan	Chasselas de Fontainebleau
Grizzly Frontignan	Royal Muscadine
Black Frontignan	Large White Sweetwater

Chiswick Nursery, London.

GEORGE TAYLOR, JUN., FRUIT SALESMAN, St. John's Market, Liverpool.
Purchaser of every description of Choice Garden Produce during the Season. Growers having Fruits and Early Vegetables to dispose of, may apply or forward as above.
TERMS, CASH.

CHEAP AND GOOD CINERARIAS.—Fine flowering plants from Turner's best seed in large 60 and 48 pots, just coming into bloom, at from 4*s*. to 6*s*. per dozen. Also fine plants of named varieties, consisting of Mr. and Mrs. S. Herbert, Adela Villiers, Garland, Constellation, Lady H. Campbell, Kate Kearney, Flora M'Ivor, Étoile de Venus, &c., at 9*s*. per dozen.—WOOD & INGRAM, Nurseries, Huntingdon.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. CORBETT'S Foreign Warehouse, 18, Pall Mall.
N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren very large and firm heads. Price to the trade 24*s*. per lb., smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

R. PARKER, FLORIST, Dalston, has VERBENA and SCOTCH RANUNCULUS SEED saved from the best Show Flowers of last year, at 2*s*. 6*d*. and 5*s*. per packet.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.
Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.

J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).
CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

CHOICE CALCEOLARIAS.

J. COLE begs to offer a few dozen of his unbloomed Seedling HERBACEOUS CALCEOLARIAS from his choice stock; they were the admiration of all who saw them last summer. They are not potted off, though strong enough for large 60-sized pots. The Seed was saved from selected stock, carefully impregnated. J. C. offers them at 4*s*. per dozen, or 25*s*. per hundred. A remittance solicited from unknown correspondents.—Keyfield Nursery, St. Alban's, Herts.

GENERAL SEED ESTABLISHMENT, NORTHAMPTON.

JOHN JEYES begs leave to inform his Patrons and Friends that his general stock of Seeds is now complete, and that he shall feel obliged by their early orders. He has a good supply of all those various Seeds his Establishment has long been celebrated for, such as Matchless Cabbage, Imperial Cos Lettuce, Conqueror Pea, Blood Red Beet, Dwarf Prolific Bean, Snow's Green Cos Lettuce, do. Broccoli, Northampton Market Broccoli, Giant Asparagus, &c. &c.

TRUE PENZANCE BROCCOLI, *saved by one of the best growers in the neighbourhood of Penzance*, 1*s*. per packet, from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MANGOLD WURZEL SEED, LONG RED, and YELLOW GLOBE, warranted genuine, and the growth of 1854. Price 45*l*. per ton.—Apply to R. S. HEWS, Kelvedon, Essex.

DIOSCOREA BATATAS, or Chinese Potato, 2*s*. 6*d*. each, or five for ... ... 10*s*. 6*d*.
HOLCUS SACCHARATUS, sealed packets of 500 Seeds 1 0
" " " 1200 Seeds 2 0
THOMAS JACKSON & SON, Kingston-on-Thames.

WANTED, Ten Thousand OSIER SETS for immediate planting, delivered at any station on the South Western Railway.—Apply, stating the price, to F. F., Avon, Ringwood.

WANTED, 50,000 each, 2, 3, and 4 feet transplanted LARCH FIRS.—Application, stating price and where delivered, to A. B. HURST & Co., Seedsmen, 6, Leadenhall Street, London. Feb. 10.

T. AND G. SWAILES having a large stock of the undermentioned, would sell at low prices—BEECH, one-year seedling fine; ASH, transplanted, 3, 4, and 5 feet; ELMS, Wytch and Scotch, &c., 3, 4, and 5 feet; HOLLY, transplanted, 1, 2, and 3 feet. Prices on application.
Beverley Nurseries, Feb. 10.

PYRAMIDAL PEAR TREES,
GRAFTED ON THE QUINCE STOCKS.

J. AND J. FRASER have still to offer strong trees of the above PEARS; a Descriptive Catalogue of the sorts may be had on application. To prevent disappointment early orders are requested, as the Stock of some of the varieties is getting low.—The Nurseries, Lea Bridge Road, Essex.

FRUIT TREES, FOREST TREES, AND SHRUBS, GARDEN AND FLOWER SEEDS, PERMANENT PASTURE GRASSES, and FINE DWARF LAWN GRASSES.—Catalogues of the above may be had on application to WILLIAM BARRATT, Saint John's Nursery, Wakefield.

JOHN HOLLAND can supply, in strong plants, the heaviest Lancashire Show GOOSEBERRIES (named), of excellent flavour, and large size, at 6*s*. per dozen, on receipt of Post-office order, payable to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

TO BE SOLD, at Prices that will be sure to give satisfaction, 10,000 STRONG CURRANTS of the following sorts, viz.:—Red and White Dutch, common Black and Black Naples, Wilmot's Superb Red, Champaign and Ruby Castle. Also a quantity of strong dwarf-trained Pears and Plums of the best sorts, Fastolff and other Raspberries, strong standard Pears, and a quantity of prime Seed Potatoes, well kept, of the best sorts.—For further particulars, apply to JAMES LAKE, Nurseryman, Bridgewater.

IMPORTANT TO SEEDSMEN AND OTHERS.

TO BE SOLD immediately by the grower, at a low price for cash, 200 Bushels of GREEN GLOBE TURNIP SEED, all of the growth of 1854; first-rate in sample and condition, and stock warranted. To be sold in small or large quantities, at the option of the purchaser.—Apply to Mr. W. TAYLOR, Nashenden Farm, Rochester, Kent.

DICKSON'S EARLY FAVOURITE PEA (NEW).

FRANCIS AND ARTHUR DICKSON AND SONS, Seed Merchants, &c., Chester, have much satisfaction in introducing the above new Pea which they believe they are perfectly justified in saying is the best and most prolific Early Pea in cultivation.

It has been tried side by side with all the best early and second early Peas of the day, and has been pronounced by many eminent gardeners who saw it under the circumstances to be much superior to any variety of its season hitherto introduced.

It comes in about a week later than the "Early Emperor" (sown at the same time), grows about 4 feet high, and produces a wonderful profusion of pods, which contain on an average 10 Peas of excellent quality and flavour.

For opinions of Dr. Lindley and Mr. Thompson, see *Gardeners' Chronicle* of 20th January, 1855.

Price 8s. 6d. per Quart; per Pint, 2s. Messrs. Hurst & M'Mullen, Seedsmen, &c., 6, Leadenhall Street, wholesale London Agents; and to be had from most Nurserymen and Seedsmen throughout the United Kingdom.—N. B. The Trade supplied on liberal terms (196, Eastgate Street, Chester, and 14, Corporation Street, Manchester).—February 10.

TWO NEW CUCUMBERS—"SIR COLIN CAMPBELL" AND "GENERAL CANROBERT."—For the full Description of the above two unequalled Cucumbers, and the List of EDWARD TILEY'S Collection of Cucumbers and Melons, which have all been thoroughly proved, see Advertisement and List in the *Gardeners' Chronicle* of January 13, 1855.

Sir Colin Campbell ... . 3s. 6d. per packet.
General Canrobert ... ... 3 6 „

A packet of either of the Melons mentioned in the former Advertisement will be given to the Purchaser of the above two Cucumbers. A remittance in cash or penny postage stamps must accompany every order, and the whole or any part (as the case may be) will be immediately forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somersetshire.

DR. SYNTAX CUCUMBER.—The above celebrated variety has been nearly lost to gardeners for several years past. It is known by all experienced growers of Cucumbers to be the very best sort in existence for early work.

A paper sent free per post on receipt of 18 stamps.

SNOW'S HORTICULTURAL BROCCOLI.—Half-ounce Packet sent free per post on receipt of 24 stamps.

NORTHAMPTON MARKET BROCCOLI.—This variety is grown by the market gardeners here, and excites the admiration of all who see it. Visitors say "they never saw such Broccoli anywhere else". Half-ounce Packets sent free per post for 14 stamps.—John Jeyes, Nurseries, Northampton.

FLEMING'S HYBRID CASHMERE MELON.—The above new Melon was raised by Mr. Fleming at Trentham, and exhibited by him for the first time at the Great Meeting of the Horticultural Society of London at Chiswick on the 10th June last against a multitude of competitors, when it was awarded the first prize, and pronounced by the judges to be very far superior to all others produced, and decidedly the best Melon known. The entire Stock is in the hands of the undersigned. Packets of Six Seeds, 2s. 6d., of 15 do., 5s.

R. GLENDINNING, Chiswick Nursery, London.

NOW READY.

WILLIAM AND GEORGE DAVISON can supply complete collections of KITCHEN GARDEN SEEDS, to suit the various sized Gardens, at the following prices:—

No. 1 Collection	... £3 0 0	No. 3 Collection	... £1 2 6

SEED & HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. Jackson.

EXTRACTS:—

"One of the fields of this farm, the property of Mrs. Stanbury, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. Baxter.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. Gordon, K.C.B., Marlee House, Blairgowrie.

"Sir,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. Jackson, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. Jackson's process may be widely known, as it is a great boon.—I am, &c.,

John Shanks,
"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. Austen, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854.

Sold by Messrs. Charlwood & Cummins, Seedsmen, Covent Garden; and John Keenan, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

SEED POTATOES.

SUTTON AND SONS, Seed Growers, Reading, have a large STOCK of the best early kinds of POTATOES, very true and free from disease. Prices, &c., with instructions on cultivation, will be found at page 20 of Sutton's Seed and Plant List, just published, price Sixpence (or gratis to purchasers).

Sutton & Sons, Seed Growers, &c., Reading.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15s., bags included.

To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5s. per bushel of 56 lbs.—Apply to John Holland, Bradshaw Gardens, Middleton, near Manchester.

Post-office Orders to be made payable at Middleton, Lancashire.

MYATT'S NEW SEEDLING POTATO, BROCKLEY KIDNEY.

W. AND J. MYATT can dispose of a limited quantity of the above excellent new Potato, which they have proved to be a first-rate variety, and has been selected as the best out of a many thousand seedlings raised at Manor Farm.

In flavour it is quite equal to the Ash-leaf, and for produce very far superior; it is a compact strong grower, and ripens off quickly, making it an invaluable summer variety. To be sent out in peck bags, 3s.; bushel, 56 lbs., 10s.

Also, EARLY MAY or BRITISH QUEEN, the earliest round Potato, middling size, suitable for planting whole, 5s.; Early Shaw, 5s.; York Regent's, 5s.; Hen's Nest, a good field Potato, 5s. per bushel; Red Ash-leaf, 2s. 6d. per peck. These are all one year's growth, from Yorkshire or Scotch sets, and will be delivered free to any railway terminus in London.

Post Office Orders are requested from unknown correspondents, payable at Deptford, to William Myatt.

Manor Farm, Feb. 10.

SEED ESTABLISHMENT, WISBEACH, CAMBRIDGESHIRE.

CHARLES SHARP begs to call the attention of the Nobility, Gentry, and the Trade to his unrivalled collection of SEED POTATOES, which have been grown and selected with great care, and perfectly free from disease. The undermentioned prices include hampers and package. Terms to the Trade known on application.

POTATOES:—

		British Queen ...	... 8s.

The largest and best produce in cultivation.

THE NEW CHINESE POTATO (DIOSCOREA BATATAS.

MR. JOHN HENDERSON has the pleasure of informing the Nobility, Gentry, and Clergy, that the opinions already expressed by him (in the columns of this journal) respecting the excellent qualities of the above new esculent (which he has had the honour of introducing into this country) are fully borne out by the most eminent Horticulturists and Botanists of the day, among whom he may mention Dr. Lindley, Professor Decaisne, of the Museum of Natural History, Paris; M. Louis Vilmorin, the well-known and scientific horticulturist, and M. Pépin, of the Jardin des Plantes, Paris.

Mr. J. Henderson also begs to call attention to the leading article in the *Gardeners' Chronicle* of the 13th ult., giving a full description of experiments made last year in order to test the value of this new vegetable; and which proves that in produce it is greater than the ordinary Potato, of hardier growth, and in its eating, cooking, and keeping qualities far its superior.

Tubers, with description of the Chinese mode of culture, to be obtained of Mr. John Henderson, Kingskerswell, South Devon, at the following prices for cash:—

Four tubers, 10s.; ten do., 1l. 2s. 6d.; fifty do., 5l. 5s.

Post-office orders are requested to be made payable at Newton Abbott, South Devon.

NEW ASHLEAF—THE "EARLY CHAMPION."

JOSEPH WILSON, Seedsman, Ipswich, begs to state that his stock of early SEED POTATOES comprises the following splendid varieties, grown expressly for seed purposes and free from disease. The "Champion" Ashleaf, 12s., a new variety, sent out for the first time this season; they are about 10 days earlier than any other Ashleaf, finer in flavour and more prolific. Jackson's improved early Ashleaf, 9s.; the Short top Ashleaf, 7s. 6d.; Nonpariel Kidneys, 6s. 6d.; Moss Kidneys, 6s. 6d.; British Queens, 7s. 6d., the earliest round variety known. Early Frame and Ashleaf Seedlings, 8s. per bushel. Free to London; no charge for sacks. A remittance must accompany all orders.

J. W. begs to say that the whole of the varieties offered have been grown especially for him, and that he has no connection whatever with any other Seedsman.

NOTICE.

EDWARD TILEY having received several letters wishing to know if his new seedling "Champion Kidney" Potato is the same as the one advertised by Mr. Joseph Wilson, of Ipswich, under the name of "The Early Champion Ashleaf," begs to say that it is not, for he purchased the whole stock from the Grower, who obtained it in the first instance from the seed of the Potato Apple, and has never parted with any of the produce but to him. E. T. feels confident that it will give the greatest satisfaction to all purchasers who may favour him with orders for the same.

TILEY'S SEEDLING POTATO—THE CHAMPION KIDNEY.—Never before sent out.

This Potato bears a great resemblance to that fine old Potato, the Ashleaf Kidney; it possesses the following good qualities over the Ashleaf. If planted at the same time it will be ten days earlier, all the sets always vegetate well, and do not die off in the ground as the Ashleaf does; 2 pecks of seed will produce a greater weight of Potatoes than 3 pecks of the Ashleaf. It is quite equal to that in flavour, and is eatable during the whole winter. Sets that have had the shoots broken off five or six times during the spring will vegetate again as if it had been the first shoot. About twenty Gentlemen and Gardeners who had seed to plant last season have assured me that they never before grew any Potato to equal it, and should continue to grow it as a first early Potato. Numerous orders have been already received from persons who saw it growing during the last summer. It has been grown and thoroughly proved for the last four years, and found to be less liable to disease than any other Potato that has been grown. Out of 25 sacks grown this season there was not a single diseased Potato among them.

Sold in quantities of not less than 1 peck; they will be sent Hamper and Package free, at 5s. 6d. per peck, or 4 pecks for 1l. hamper free. A remittance in cash must accompany all orders, or small amounts in penny postage stamps. Purchasers would do well to name the nearest railway station to their residence.

EDWARD TILEY, Nurseryman, Seedsman, & Florist,
14, Abbey Church Yard, Bath, Somerset.

THE LARGEST STOCK AND LOWEST PRICES IN ENGLAND.

JOHN WESTWOOD, the FLORAL NURSERY, Acton Read, Turnham Green, near London, having an enormous and well selected stock of SOFT-WOODED PLANTS, and most extensive premises (the glass covering 3 acres of land), is enabled to offer it to the public and the Trade at prices far lower than any hitherto heard of, but as it is impossible to convey by advertisement anything like detailed or sufficient information of the advantages or resources of his establishment, he respectfully requests all who desire to purchase plants to apply for his Catalogue for 1855 (which is now ready), and he will immediately forward it postage free.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6s. per doz.; HOWARD'S PRINCE ALBERT, 12s. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford, Feb. 10.

NEW SHRUBBY CALCEOLARIAS.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that a Descriptive Catalogue of his beautiful new Shrubby Calceolarias is now ready, and may be had upon prepaid application.
Very choice Calceolaria and Pansy Seed, 2s. 6d. per packet. Postage stamps are respectfully requested in payment of the seeds.

NEW RIDGE CUCUMBER, VECTIS.

THOMAS TAYLOR begs to inform the public he has produced this fine Cucumber, grown it for three years, and can confidently recommend it as the best ridge Cucumber ever offered to the public, being equal in quality and flavour to many of the frame varieties, and very prolific. T. T. is now ready to send it out at 1s. per packet, 12 seeds, post free.—THOS. TAYLOR, Nurseryman, Weston-super-Mare, Somerset.

CHARLES SHARPE AND CO., SEED GROWERS, beg most respectfully to invite the attention of the Trade to their very superior stocks of Carrot, Mangold Wurzel, and Turnip Seeds, all of which have been carefully grown by themselves. Prices may be had on application.
DIOSCOREA JAPONICA.
C. S. & Co., have received from abroad a quantity of Roots of the above, and will be glad to supply the Trade. Prices on application.
Nursery and Seed Establishment, Sleaford.

GERANIUM—"ENGLAND'S GLORY."

BAINBRIDGE AND HEWISON have purchased this beautiful bedding Geranium. The colour of the flower is pale flesh, or maiden's blush; the leaf of the horse shoe kind, and very glossy; the individual flowers are smooth, of great substance, and of exquisite form. It is an abundant bloomer, an exceeding large trusser, and throwing its flowers well above the foliage. It resembles much the Hydrangia, and is considered the best Geranium out for bedding or conservatory.
Plants in June, 1855, 5s. each. The usual allowance to the trade when three Plants are taken.—York Nurseries, Feb. 10.

VEGETABLE AND FLOWER SEEDS.

JAMES DICKSON AND SONS beg to intimate to their Patrons and the Public that, having now completed their stock of GARDEN and FLOWER SEEDS for this season, from the best growers and truest stocks, they are now prepared to send them out, making arrangements for carriage likely to meet the views of all parties who may favour them with their commands. Priced Catalogues may be had on application.
J. D. & Sons would also call attention to their AGRICULTURAL SEEDS, which have been carefully grown under their own inspection, from selected stock, priced lists of which will be ready shortly.—Nursery and Seed Warehouse, 32, South Hanover Street, Edinburgh.

POLYANTHUS SEED.

JAMES WOODS has again this year to offer a quantity of POLYANTHUS SEED, saved with more than ordinary care, from named and good laced flowers, which he can recommend with confidence, having had numerous Testimonials from different parts of the Kingdom of good and valuable flowers being raised from his seed. He will be able to send seed to grow 200 plants, with directions for sowing. Price 1s. per packet, or sent free, on receipt of 18 postage stamps to JAMES WOODS, Florist, Harwich, Essex.
P.S. Plants of Polyanthus will be sent out in April, with blooms on each plant, with name or otherwise, from 6d. to 3s. 6d. per plant.
J. W. has a small quantity of Auricula Seed, saved from a fine collection of Alpines, at 1s. per packet as above.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.
We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

W. DRUMMOND AND SONS' NEW DESCRIPTIVE CATALOGUE, containing select varieties only, of VEGETABLE and FLOWER SEEDS is now ready, and may be had post free on receipt of one postage stamp. This Catalogue will, at a glance, furnish the Gardener with all the necessary material for drawing out his Seed List correctly and without trouble. In reference to it the *Gardeners' Chronicle* remarks:—
"It is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon for the sake of both buyer and seller;" and this opinion has been cordially responded to by all our old and many new customers.
W. DRUMMOND & SONS' Seed and Implement Warehouse, Stirling.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.
The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.
WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices:—
Mixtures for laying Land down to permanent Grass, for light, heavy, and other soils (allowing 2 bushels and 12 lbs. to the acre ... ... 30s. per acre.
Mixtures for Park or Field Lawns (allowing 2 bushels and 12 lbs. to the acre) ... ... 32s. per acre.
Mixtures for improving and renovating old Grass Land, 1s. per lb.
Mixtures (finest sorts) for forming Lawns... ... 1s. 3d. per lb.
These Seeds are are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.
G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE will shortly be ready, and will be forwarded free on application.
GEORGE GIBBS & CO., SEEDSMEN,
26, Down Street, Piccadilly, London.

DAWE, COTTRELL, AND BENHAM, beg to inform their friends and patrons that their Descriptive Retail LIST of FLOWER, GARDEN, and AGRICULTURAL SEEDS is now ready, and may be obtained, post free, on application.
D., C., & B. also beg to offer the following CHOICE ROOTS at very low prices.

Anemones, single purple, very fine ...	per dozen ...	3s.
" " scarlet, " ...	" ...	2s.
" " mixed, " ...	per lb. ...	3s.
Gladiolis florabundus, large	per dozen ...	2s.
" Gandavensis, very fine ...	" ...	5s.
and many other choice varieties.		
Iris Germanica, splendid var., mixed,	per dozen ...	4s.
Ranunculus, mixed, double, very fine,	per 100 ...	5s.
Tuberoses, fine double, Italian ...	per dozen ...	3s.

36, Moorgate Street; and 304, Laurence Pountney Lane, Cannon Street, London.—Established at 28, Cornhill, 1720.

NEW PLUMS.

MR. H. DOWLING, FRUIT GROWER, Woolston Lawn, Southampton, begs most respectfully to return his sincere thanks to the Nobility, Gentry, and Public generally, for the liberal patronage he has received, and informs them that owing to his Garden being about to be cleared for building, he has to offer the above at unusually low prices. Fruit Growers and the Trade will find this a rare opportunity to supply themselves with them. H. D. has received Testimonials from those that fruited them this season. He can with confidence recommend the Black Gage and Angelina Burdett as superior to any other Plum for prolificness and flavour; good strong Trees, and the prices can be obtained at Mr. CHARLES TURNER'S Royal Nursery, Slough; of Mr. HENDERSON, Pine Apple Place, London; or the Grower, at Woolston Lawn, Southampton.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out. Catalogues may be had on application.

Lilium giganteum Seed	per 100 seeds ...	5s. 0d.
White-topped Clary	per packet ...	1 6
Limnanthus sulphurea odorata...	" ...	1 6
Dianthus Dunnetti superbus ...	" ...	1 6
Escholtzia tenuifolia	" ...	1 0
Leptosiphon aureum	" ...	1 6
Whitlavia grandiflora	" ...	1 6

Pine Apple Place, Edgeware Road, London.

SPRUCE FIRS from 6 to 9 feet high, well-rooted and quite safe to remove, being well adapted for screens, filling up old plantations, or for immediate effect.
FINE BEECH fit for hedges or plantations, 6 feet and upwards.
G. WHEELER, Nurseryman, Warminster, Wilts, having a surplus stock of the above, is disposed to sell them on extremely moderate terms, which may be obtained on application.
G. W. has a good stock of SCOTCH FIRS, 2 to 3 feet, a large stock of RHODODENDRON suitable for cover in woods, plantations, drives, &c., from 1 foot and upwards, with fine strong American Azaleas, at very moderate prices.
SEEDLING CALCEOLARIA, raised from the finest spotted kinds, will be sent carriage free on receipt of a Post Office Order for the amount, at 30s. per 100.

	Per doz.
BULBS OF TIGRIDIA PAVONIA. Red Tiger Flower...	2 0
" " CONCHIFLORA, Yellow ditto	4 0
" " WHEELERI, Scarlet ditto ...	4 0

Carriage free for cash.
CUCUMBERS, first-rate.—THE KING, a very handsome Black Spine, and Ingram's Hybrid White Spine, a most prolific kind, both approved and esteemed sorts, at 1s. per packet.—G. WHEELER, Warminster, Feb. 10.

TO THE TRADE.

JOHN HARRISON begs to offer to the Trade the undermentioned plants, of which he has a large stock.

Rose Manetti, strong cutting	25s. 0d.	p. 1000
Raspberry, Northumberland Fillbasket, the best variety in cultivation, 20s. per 100 ...	160 0	"
Do. Fastolff, 8s. per 100, or	60 0	"
Do. Wilsher Red Globe, ...	10 0	per 100
Do. Magnum Bonum	10 0	"
Rhubarb, Victoria, strong	25 0	"
Do. Royal Albert, do.	30 0	"
Currants, Victoria, 1 year old...	6 0	"
Do. do. 2 years old, strong ...	12 0	"
Do. Black Naples, 1 year	6 0	"
Do. do. do. 2 years	10 0	"
Do, do. Bang-up, extra fine	12 0	"
Arbor-Vitæ, 1½ to 2 feet	15 0	"
Juniper, Swedish, 1½ feet	25 0	"
Cupressus Funebris, 1½ feet	100 0	"
Delphinium Barlowi, strong	40 0	"

Roses of all the best varieties in cultivation, of which J. H. has a stock of many thousands, one year established in pots, and fit for immediate forcing.—Nursery, Darlington, Feb. 10.

NEW CINERARIAS.

C. H. GARDINER, of Fant Nursery, Maidstone, will commence sending out plants on the 1st of March next of the following first-class flowers, raised by Mr. Frost, gardener to E. L. Betts, Esq., of Preston Hall, and pronounced by competent judges to be equal if not superior to any in cultivation.
LADY JULIA CORNWALLIS—White, with great depth and width of petal, finely margined with porcelain blue, light blue disc, fine shape, extra size; first-class flower. 10s. 6d.
MISS BANNERMAN—Clear white, with well defined margin of rosy crimson, dark disc, large fine-shaped petals; habit good; one of the best. 10s. 6d.
MRS. R. RICKETTS—White ground colour, with broad margin of rich plum; good form and habit. 10s. 6d.
SIR W. MIDDLETON—Deep purple, with distinct ring of crimson round the disc; large fine-shaped petals of extra size and good habit; first-class flower. 10s. 6d.
MATILDA—White, with purple lilac edge; light disc; good shape and habit. 5s.
FORGET-ME-NOT—Fine shaped petals; colour crimson purple; good habit and fine form. 7s. 6d. If the set of six be taken, the price 2l. 10s.

RANUNCULUSES, ANEMONES, LILIUM LANCIFOLIUM, CALOCHORTUS LUTEUS, CALLIPRORA FLAVA, GLADIOLUS, TRITONEA AUREA, DIELYTRA SPECTABILIS, VALLOTA PURPUREA, ANOMATHECA CRUENTA, AND AURICULAS.

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY, begs to say that he has a fine Selection of the above BULBS, &c., which he can supply at Moderate Prices. His Catalogue will be forwarded on application.

IPOMŒA RUBRO CÆRULEA.

GEORGE ROBERTS begs to acquaint the Seed Trade that he can supply the above choice seed at a considerable reduction on the prices of past years.
32, Moorgate Street, London.

CONQUEROR OF THE WEST CUCUMBER.—A Packet, containing 12 good seeds of this first-rate Framé Cucumber, which for productiveness is second to none, will be sent post free, on receipt of 12 postage stamps, addressed to JAMES LAKE, Nurseryman, &c., Bridgewater.

GENUINE SEEDS.

THE MEMBERS OF THE "SEED GROWERS SOCIETY," continue to supply genuine AGRICULTURAL, VEGETABLE and FLOWER SEEDS at Growers' prices. Lists with price and terms of business may be had on application to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.
G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

MAY'S MAGNUM BONUM LETTUCE.—Parties who were disappointed last season in receiving the above, can now have it by early application, in Packets 1s. each, free by post. We have numerous letters to show, received from parties who had it last season, to say that it is the most magnificent Lettuce they ever saw.—Address, HENRY MAY, The Hope Nurseries, near Bedal, Yorkshire.

HOLCUS SACCHARATUS, OR CHINESE SUGAR CANE.—*For a full description, see the leading article in the* GARDENERS' CHRONICLE, *by Professor Lindley, page* 35, *January* 20, 1855.
WILLIAM E. RENDLE & Co., Seed Merchants, have just imported from France an excellent parcel of Seeds, which will be sold in sealed packets at 1s. and 2s. 6d. each, post free.—Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MELVILLE'S HARDY SCOTCH BROCCOLI *will stand the most severe winter, and therefore invaluable.* 100 Seeds for 1s.
For full description, see "RENDLE'S Price Current and Garden Directory for 1855."
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MELVILLE'S TREBLE CURLED GARNISHING BORECOLE.—*This is the choicest and most useful Vegetable for garnishing ever introduced, and should be grown in every garden.* 200 Seeds for 1s.
For description see "RENDLE'S Price Current and Garden Directory for 1855."
WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MELVILLE'S NEW INTERMEDIATE HYBRID CABBAGE.—*This is a valuable addition to our stock of Vegetables, and should be had by all who have gardens.* 200 Seeds for 1s.
For description see "RENDLE'S Price Current and Garden Directory for 1855."
WILLIAM E RENDLE & Co., Seed Merchants, Plymouth.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN AND FLOWER SEEDS *may still be obtained, as see last week's Gardeners' Chronicle.*
JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 10, 1855.

THE WINTER MEETING of the HORTICULTURAL SOCIETY last Tuesday in Regent Street, under the new arrangements, was perfectly successful, as will be seen from the report in another column. It was quite a representation in miniature of the great exhibitions at Chiswick. Richly as the tables were covered with beautiful objects, there is no doubt that the display would have been still finer had the weather been more propitious; but exhibitors cannot carry tender plants of great value through sleet and a north-east wind without exposing them to danger; and it was impossible not to admire the horticultural enthusiasm which produced so much in such a season.

The only difficulty that the Society seems likely to encounter resides in the very limited space at command. It is however to be hoped that the number of hours, four or five according to the season, during which the meeting lasts, will enable visitors to see everything with no more inconvenience than attends a London evening party.

AMONG the interesting subjects introduced at the meeting of the Horticultural Society were the fine diagrams of WELLINGTONIA used by Mr. BATEMAN in his interesting lecture, of which we last week gave a report; with the addition of the following remarks, by a Fellow of the Society, upon the supposed age of the trees now existing in California.

It appears that "in *Silliman's Journal*, vol. xviii. p. 286, is a correction of the exaggerated estimates made of this subject. It states that—

"1st, the hollowed section exhibited at Philadel-

Phia, which formed the basis of the former calculation, was not from the famous Wellingtonia, but from a Sequoia sempervirens growing much nearer San Francisco.

"24. Dr. Torrey has now had an opportunity of counting the whole of the layers on a *complete radius* of a trunk of *the* Wellingtonia, and he finds they are only 1120, not 3000 in number.

"In proof of the fallacy (which has of late years been occasionally alluded to) of calculating the number of rings in a tree by counting those of a portion of the radius, and of estimating the remainder by measurement, Dr. Torrey gives the following data on the rate of growth of the Wellingtonia:

The 1st 100 layers	occupied	17½	inches.	
2d	"	"	14	"
3d	"	"	12¼	"
4th	"	"	13	"
5th	"	"	16¼	"
6th	"	"	8¾	"
7th	"	"	7¾	"
8th	"	"	11	"
9th	"	"	10	"
10th	"	"	11	"
11th	"	"	11¼	"
Remaining 20 layers			1	"

1120 layers occupied 135 inches, or 11 feet 3 inches, the semi-diameter of the trunk.

"In illustration of the still greater fallacy of calculating the age of a tree from the thickness of its stem, without even knowing the rate of growth of any part of it, whence arose the fabulous estimates of the age of the Adansonia, I may mention that I lately counted the rings corresponding to the known age of a Quercus pedunculata of 62 years of age, which had the very same diameter as other trees of the same species growing within a few miles of it, with between 110 and 120 rings.

"The Wellingtonia remains, however, the oldest tree in a state of health whose age has been *ascertained*, and 1120 years is no mean age, although I believe some of the stunted, battered, half-rotten, but ever re-shooting up Olives of the Mediterranean, to be much older than that."

More than 20 years ago the writer of the present article pointed out (Introduction to Botany), in the following observations upon the growth of exogenous trees, how great are the errors to which De Candolle's method of computing age is liable.

"With regard to judging of the age of a tree by the inspection of a fragment, the diameter of the stem being known, a little reflection will show that this is to be done with great caution, and that it is liable to excessive error. If, indeed, the zones upon both sides of a tree were always of the same, or nearly the same thickness, much error would, perhaps, not attend such an investigation; but it happens that, from various causes, there is often a great difference between the growth of the two sides, and consequently, that a fragment taken from either side must necessarily lead to the falsest inferences. For example, I have now before me four specimens of wood taken almost at hazard. The measurements of either side, and their age, as indicated by the number of zones they comprehend, are as follows:—

	Diameter of		Total.	Real Age, or Number of Zones.
	Side A.	Side B.		
Benthamia fragifera	9 lines	36 lines	45 lines	40
Pyrus foliolosa	8 "	22 "	30 "	36
Magnolia insignis	11 "	20 "	31 "	17
Alnus napalensis	11 "	23 "	34 "	8

"Now, in the first of these cases, suppose that a portion of the side A were examined, the observer would find that each zone is 0.225 of a line deep: and, as the whole diameter of the stem is 45 lines, he would estimate the side he examined to be 22.5 lines deep; consequently, he would arrive, by calculation, at the conclusion that, as his plant was one year growing 0.225 of a line, it would be 100 years in growing 22.5 lines, while, in fact, it has been only 40 years. And so of the rest."

The statements of Dr. Torrey as above given from *Silliman's Journal*, confirm in every particular the justice of the foregoing remarks. Nevertheless, we are still at liberty to believe in the possibility of trees living to the age of 3000 years and more, although we have no positive proof that they have actually done so. In the garden of the late Sir Robert Vaughan, at Nannan, in Merionethshire, there once existed a gigantic Oak, which was said by tradition to have been the very tree in which Owen Glendwr confined the Welch chieftain, Howel Sale, taken prisoner by him in the time of Henry IV. Let us suppose this tree, which was of course hollow, to have been only 3 feet in diameter in 1410 (and it could not have been less, and was probably much more), and let us take the annual growth of old Oak trees to be 1 inch of semi-diameter in 20 years, it must in that case have been 360 years old in 1410; to this add 403—the number of years that intervened between 1410 and 1813, when it was blown down, and we shall obtain a total age of 763 years. It was, no doubt, much older,* and there is no physical reason why, if a tree can grow for 763 years, it should not, in the absence of accidents, acquire four times as great an age.

Nor is it necessary to limit to Wellingtonia the evidence of trees having actually enjoyed a prodigious longevity. The so-called Cypress of Montezuma, in the garden of Chapultepec (Mexico) measured, not many years ago, forty-one feet (English) in circumference; but it dwindled to nothing before the gigantic trunk of a Taxodium near Santa Maria de Tesla, in the province of Oaxaca, which was first mentioned by Exter, who found its circumference to be 117.10 feet (French). De Candolle thought that, in this case, either several trees might have grown together, or that the measurement had been taken round the dilated base of the trunk; but Zuccarini assures us that Baron Von Karwinski twice measured this tree, and sent him a drawing of it, which enabled him to remove all such doubts. "The measurement," he says, "was always taken above the dilatation, and on each occasion the girth was found somewhat to exceed 117 feet. The dilated base was not measured, but from the drawing it must have a circumference of at least 200 feet, and thus the diameter of the trunk must be about 39 feet, and of the enlarged base about 60.5 feet. The dilated base surrounds the whole trunk equally, so that it cannot readily be supposed that the size is owing to the accretion of several trunks. Now, if we take as a basis for computation the statement of Michaux, given by De Candolle, that the most thriving specimen of the tree in France attained in 45 years a diameter of 1 foot, or 144 lines, and consequently, that annual rings were formed of the thickness of 3·2 lines, and supposing a similar increase of wood to occur up to the most recent period of growth, it would appear that the trunk in question, which has a diameter of 5352 lines, would be 1672 years old. This supposition, however, is rather improbable, since perhaps none of the Conifers in the latter periods of their growth ever deposit so much as 12·8 lines of wood within four years. If, again, we assume the annual increase to average only one line, we get 5352 rings, and, consequently, that number of years is the age of the tree; but if we take the mean of these two numbers, we should arrive at 3512 as the most probable number of years of age, and at an annual addition of ligneous rings of 1.6 lines in thickness, which is sufficiently considerable." (*Ray Papers*, 1846, *p.* 21.)

All this is however conjectural in the absence of an actual counting of the rings; as is the age of the great Brazilian Leguminous trees found by Von Martius, and computed by one calculator to be 4000 years old, while another, employing a different mode of estimation, could not reduce it below 2052 years. But these were pygmies by the side of the Taxodium of Tesla.

These remarks do not diminish our interest in Wellingtonia; they only reduce fabulous history within the limit of fact, itself sufficiently surprising, and show that, colossal as are the dimensions of "the great tree," they are equalled by other trees concerning which there is no room for doubt.

Advices from Shanghai, of Nov. 18, inform us that Mr. Fortune had just returned from the Tea districts in Che-Kiang, with another large collection of seeds and plants for the East India Company. It appears, from a report from Dr. Jamieson, that 23,892 Tea plants had reached the Himalayas in good condition, along with 178 healthy seedlings of the Chinese Chesnut (a species of Castanea), 628 plants of the Hemp Palm, several grafted specimens of the Yang-mae, or eatable *Myrica*, and various other plants. Among the latter is the true *green* Indigo (so called) a plant hitherto so little known that it has been supposed to be *Sophora japonica*, the dye of which is, we understand, yellow, not green. Our letters do not say what the green Indigo really is, but we shall probably learn ere long.

New Plants.

112. Senecio mikanioides, *Otto. Walpers' Repertorium*, vi. 264; *aliàs* Mikania senecioides *of Gardens; aliàs* Delairea odorata, *Lemaire Hortic. univ., May* 1844; *aliàs* Breonia palmata *of Belgian Gardens.*

This plant having been made the subject of a communication in the last number of the "Revue Horticole," and being almost unknown with us, the following notes upon it may prove useful. It is a climbing greenhouse shrub from the Cape of Good Hope, suited for purposes such as those to which *Lophospermum* is applied. The leaves are deeply cordate and angular. The flower heads appear in large loose long stalked axillary corymbs; are yellow and sweet-scented, but having no ray want breadth of colour. According to M. Verlot, of Orleans, its cuttings should be struck in heat in February or March, put into small pots as soon as they have struck, and planted out in May, when they immediately push vigorously; with us June should be read for May. Last year 10 plants were employed to cover a paling (*barrière*) 36 feet long and 4 feet wide; they were repeatedly stopped to make them throw out laterals, and in three months they had covered the space. The plant may also be pegged down, and made to cover slopes and beds with verdure. It will not, however, flower out of doors, even at Orleans, but must be brought into the greenhouse in the autumn. The flowers, which smell like Heliotrope, will then open in December and January. The plant, though only a climbing Groundsel, seems to be worth growing for winter decoration.

* There is an apocryphal story of an Oak tree having been felled in the Ardennes, within whose trunk were found coins struck 276 years before the foundation of Rome. That tree was, therefore, estimated to have been 3600 years old.

VEGETABLE PATHOLOGY.—No. LVIII.

264. Apostaxis.* *Distillation.*—Under this denomination it is proposed to consider all abnormal emissions of nutritive or secreted fluids. The circumstances under which the phenomena take place may be very various, and the consequences of more or less gravity, according as they are temporary or chronic, or may be complicated with other diseased action.

265. Apostaxis (*Constitutional and Functional*),—Weeping.—The nutriment of plants is received from the ground, in the form of a very attenuated solution, which in its progress through the system levies contributions from matter previously assimilated; insomuch, that when it has arrived at the leaves, though still highly aqueous, it is charged more abundantly with extraneous matter than it was on its first imbibition. That the sap may serve for the proper nutriment of the plant in its return from the leaves, it is necessary that a large portion of the water should be eliminated, an effect which is produced by the process of exhalation, in consequence of which the watery particles pass off in the state of vapour, as may easily be observed by the condensation of this insensible perspiration on a glass or any other cold polished surface. The fluid in such cases is found not to be pure water, but to contain a slight per-centage of heterogeneous matter. This process is absolutely necessary to health, and where it is impeded it is a fruitful source of mischief. It is in a high degree dependent upon outward atmospheric condition or other external causes, to which we shall have to advert hereafter; for it is altogether uncertain whether in any case constitutional weakness prevents it from taking place, the effect of which would be to produce a general dropsy. The affection or condition which we have under consideration is of a precisely contrary nature, and can, when slight, scarcely be considered a disease. It is not, however, a normal condition, or one which, if chronic, could be productive of any other than evil results. Under the circumstances of which we speak, so far from the exhalation being impeded, it is exaggerated into a copious dripping of a watery fluid from the leaves, to which the name of weeping has been applied. It is not to be confounded with the showers of manna which in hot weather descend from many trees, and to which probably the tales of the poets are for the most part applicable, but is simply an overflow of the ascending unelaborated sap, occurring principally if not exclusively at the tips of the leaves or serratures, and thus simulating in some measure the formation of dew. It is peculiarly common in the Vine when cultivated in conservatories, and may be seen in especial abundance in such plants as Canna, where the watery fluid sometimes almost streams from the leaves. It is observed principally when water has just been applied to the roots, and depends upon the upward current being too strong to be arrested by the walls of the more external vessels, so as to wait for the natural exhalation due to external agency, insomuch that the fluid matter bursts forth bodily, the points of least resistance probably being the more or less acuminate portions of the foliage through which it drips. It is very probable that there may be some lesion of the cells at these points, or otherwise the natural course should seem to be rather through the stomates. It would be interesting to institute a comparison between the condensed fluid arising from evaporation, and the fluid thus exuded; but we are not able to find that such an estimate has at present been made. The waste of matter due to the phenomenon is probably never very large, but a little attention would soon show at what time of the day, or under what condition the evaporating power of the atmosphere is such as to admit of this sensible passage of the fluid, and at such times and under such conditions water should not be applied to the roots. As, however, the phenomenon is far more visible in some particular plants than in others, and is not exhibited in all at the same time and under similar conditions, it depends probably in great measure on constitutional peculiarities over which the cultivator has no control.†

266. A similar affection takes place in the buds of

* Derived from ἀπο from and σταζω to flow.

† An aqueous fluid is copiously secreted in Nepenthes, Sarracenia, and Heliamphora, and not improbably is derived from the plant itself in Dischidia and some other cases where the fluid contained in open cavities is supposed to be altogether extraneous. What relation some of these cases may have to the phenomenon in question is at present uncertain; in others the fluid has peculiar properties, and is evidently a real secretion.

Vines, and of some other trees, in consequence of the exuberance of the spring sap. It is perhaps well in such cases that nature should find a ready outlet for fluids which might produce bad consequences if stagnating in the cells without any aqueous exhalation. In both instances perhaps it would be more proper to consider the matter as an abnormal phenomenon than as a real malady. *M. J. B.*

COMMON THINGS,

Centradenia rosea.—Though not very showy, this is really a useful little plant, which, under ordinary cultivation, may be made to blossom abundantly all through the winter and spring. Cuttings struck early this month, and properly attended to, will be bushy plants by the end of June, at which time they should be in 5-inch pots, and should be removed from the stove or propagating house to a light and airy greenhouse shelf. If large specimens are not wanted, they should not be shifted after this, but should be allowed to become somewhat pot-bound, and they will not require any further attention, except moderate waterings till the end of September, when a few of the plants may be introduced to a light and warm shelf in a stove or intermediate house, where a temperature of 65° or 70° by day can be given. The rest may follow successively; and it is worthy of remark that they do not open well except in tolerably bright light; they, therefore, do best placed on a shelf near the glass. For soil take equal parts of loam, sandy peat, and vegetable mould, mixed with a good sprinkling of powdered charcoal.

Club in Broccoli.—The following is a good way of preventing this troublesome disease. In the autumn never omit to ridge up the ground intended for spring sowing, in order that it may have the benefit of the winter's frost to pulverise it. When the time for sowing has arrived level the ground roughly, then dig it over regularly, and form it into beds; when that is done, burn any prunings of shrubs and trees that may have been collected during winter, and spread the ashes on the beds to the depth of 2 or 3 inches. Then with a Potato fork well mix the ashes with the earth to the depth of 4 or 5 inches, sow the seed in the usual way, rake all in smoothly, and the operation is finished. It may be added that the fresher the ashes are the better, and that those from green wood are preferable to those from dry. It will be evident that the alkaline bases found in the wood ashes are what produce the effect.

CHOIX D'UN AMATEUR PEAR.

There are some historical details relating to the origin of certain varieties of Pears which are only verbally known in the countries in which the varieties have been obtained. If one does not take the trouble to give an exact account where it will be recorded in pomological works of the day, his knowledge will be lost in some few years. After a certain lapse of time, when the variety begins to fruit in various gardens, questions will be asked respecting the name of this Pear, when and where was it raised?

Towards the end of his career, the late Van Mons, not expecting to see the fruit of his seedlings from the latest sowings in the nurseries of Louvain, and fearing that after his decease these seedlings would not be preserved, sent grafts of a certain number of the most promising of these seedlings to his friend and pupil, M. Bouvier, of Jodoigne. One portion of these was sent in 1837. Being worked on strong seedling stocks, most of the varieties fruited in 1842 and 1843. The grafts, it will be understood, were well selected and carefully worked.

Neither the first nor the second fruiting was thought sufficient by M. Bouvier for determining the relative merits of the seedlings; but of the third production, which was very abundant in 1844, that being a most favourable season, he submitted many of the fruits to his amateur friends and connoisseurs like himself; and he then, without hesitation, said of the above-named variety, "This is my choice" (*ceci est mon choix*); and being unanimously approved, it was agreed that the variety should be called *Choix d'un Amateur*, adding the words Van Mons, the grafts having been taken from one of the seedlings raised by the professor at Louvain. As possessor of the nurseries, M. Bivort was charged with sending out this new variety, and it was announced in his catalogue 1845-6. Since then it has been cultivated in our nurseries, and has been observed up to the time of its fruiting.

In 1849, a good graft having been placed at 7 feet high on a strong stock, we had the satisfaction of seeing last summer, on the branches of this graft, about a score of handsome fruit.

As this variety is not described in any special work, nor even in any catalogue, as far as I am aware, and as the fruit is but little known, I shall endeavour to give a description of the tree, and of the fruit and its qualities.

The seedling itself we have not been able to discover, neither in the collections of the successors of Van Mons nor in the gardens of Louvain, where, after the decease of the professor, it had doubtless been lost, together with many other valuable sorts. The strong stem grafted in 1837 has been in vain searched for in the garden of the late M. Bouvier. We have been informed that his successors divided the best of the trees, which were consequently sent in different directions. We can therefore only describe such of the characters of this variety as may be done with confidence from a pyramid of seven, and a standard of five years from the graft, and in a bearing state.

By the colour of its wood, the form of its branches and shoots, by its leaves and the general habit of the tree, this variety is as distinct from all others as the Beurré d'Hardenpont, Marie Louise, Docteur Trousseau, Prince Albert, Leopold I., and Comte de Paris, are distinct among themselves.

The tree is hardy and vigorous, and forms a handsome pyramid. Its shoots are long and spreading; the upright stem is erect, and of stiff growth. The colour of the trunk is greyish olive brown, and the two-year-old branches partake of the same hue. The one-year-old wood is pale greenish brown, sprinkled with grey dots, but these disappear the second year. The upper parts of the shoots are bright brown, with very distinct white spots. The buds are about an inch apart; on the bearing wood they approach to half that distance. The wood-buds are very large, but pointed; the fruit-buds are still larger and rounded; both have a greyish appearance. The fruit-buds are large, plump, and can be known decidedly in the second year of their formation, a sign that the tree is a good bearer. The flower is large and sets readily, which proves its hardiness. The leaves are of a delicate green, undulated, and channelled, and possess all the characters of those of varieties which produce the finest fruits. It is very productive as an orchard standard. A strong graft, taken from the stem of the stock plant and worked on a vigorous stock, had the shoots properly disbudded, pinched and not much shortened, and produced in the summer of 1854 a score of fruits after 50 had been thinned off in May. Part of the fruit gathered on the 18th of September commenced to ripen on the 25th of that month. Another part, gathered on the 28th September, ripened from the 10th to the 25th of October.

The general form of the fruit is oblong-ovate, full towards the stalk, and swelling towards the eye. It is from 3 to 3½ inches in length and 2 inches in diameter. The stalk is from 1 inch to 1¼ in length, strongly attached to the spur, so that, till fit for gathering, the fruit is not apt to be blown down. The eye is regularly formed in a shallow cavity. The skin is thin, smooth, pale green when the fruit is gathered, becoming gradually paler as the fruit approaches maturity. The flesh is snow-white, melting, juicy, vinous and sugary, very free from grit, except a little near the core, which is small. The seeds are small, roundish, but well filled, which indicates that the variety has sprung from a good race; their colour is black or brownish black.

In short this variety may be considered as a valuable acquisition. Although it ripens at the same time as many other excellent sorts, the Choix d'un Amateur will maintain a distinguished place in the collections of good judges who have tested the fruits, of which none of the 20 gathered was found in any way imperfect; and it well deserves the name of Choix d'un Amateur, applied to it by M. Bouvier. From its form it could not be ranked in any of the classes of Pears designated by a generic name [such as Bergamotte, Bon Chrétien, &c]. It is necessary to remark that this variety does not succeed on the Quince stock. *J. de Jonghe, Brussels, Jan.* 16, 1855.

Note.—It is probable that as the tree gets older the fruit in favourable seasons will be larger and less variable in form. This observation is applicable to all varieties of Pears recently obtained from seed; for with regard to the qualities of such we cannot decide with certainty till after having obtained fruit for several successive years from healthy, vigorous, well established trees.

CLIMATE OF FOREIGN COUNTRIES.—No. III.

Nice, *Feb.* 2, 1855.—The snow mentioned in my last as having fallen here on the 21st ult. has since quite disappeared, and is now succeeded by beautiful warm weather. Yesterday was equal to any of our English summer days. In confirmation of my statement that the temperature had been unusually low, I may observe that a person who has been resident here for the last five years informed me that the thermometer in a room without fire has not been known to be under 50 until recently, when it fell to 45°.

At Paris, on the 24th ult., a partial thaw succeeded to the late frost, but severe weather has again set in there. On the 26th the thermometer fell to 23°, on the 27th to 20°, on the 28th to 18°, on the 29th to 12°. The Seine began again to freeze over. It has been nearly the same at Lyons, and also very cold at Brussels. On the 22d at Strasbourg it was down to 18° below zero of centigrade or zero of Fahrenheit. The same at Turin on the 24th, and again on the 29th and 30th 31° below freezing. Here the min. was 5° above freezing, and at a distance of only about 120 miles, the difference being no doubt mainly attributable to the peculiar situation of Nice and the proximity of Turin to the Alps.

I hope that the following description of the London weather, which I take from the correspondence of the French newspaper *La Presse*, is a little overdrawn. You may, however, like to see what account is given to foreigners of the climate of our fatherland. Writing from London 26th January, the correspondent says:—"It has snowed for the last four or five days without interruption; a thick fog and rime envelopes the city. It is mid-day, and I can hardly distinguish the letters I trace upon the paper. This lugubrious atmosphere naturally makes the spirits to be in unison with the sentiments which now prevail in England."

The increase and decrease of the power of the sun's rays here in the day will appear from the following account of a thermometer hung therein on the 26th ult.: 9 o'clock, 94°; half-past 9, 107°; 10 o'clock, 114°; half-past 10, 119°; half-past 11, 124°; at 12, 121°; half-past 12, 117°; 1, 110°; 2, 90°; 4, 74°.

New Potatoes are now sold in the market, at 9*d.* the kilogramme, being rather more than 2 lbs. weight English; Green Peas (in pod), 1*s.* 3*d.* for the same quantity. In the vicinity of Nice there is a valley partly covered with the beautiful single blue Hepaticas (triloba), which are now coming into flower. Crocuses (wild) are also in blossom. Some Snowdrops in pots I saw yesterday treated as greenhouse plants; they are, however, found wild on some of the hills. Primroses also are in flower, but are rather scarce. Violets, the sweet single blue, are becoming quite plentiful on the banks, and the Anemones in the Olive grounds. There is a beautiful bright yellow flower now also in blossom (under protection) called "Jonquil ferruginea," upright in growth, the flowers nearly the size and shape of the Petunia—a charming winter plant.

NOTES UPON THE LATE REPORT TO THE TREASURY ON THE PRESENT STATE OF THE ROYAL WOODS AND FORESTS.

In the instructions to the Commissioners when authorised to inspect Alice Holt Forest, and to give their opinion on the point of dispute between Mr. Brown and the Deputy Surveyor, the Commissioners are, with a semblance of impartiality, desired to have *no intercourse with either of the parties interested:* from page 5, however, it appears that they did call to their assistance the Deputy Surveyor's officers, men openly opposed to Mr. Brown.

(P. 13.) The Commissioners are directed to decide on various questions of controversy which have arisen between Mr. Brown and the Deputy Surveyor of Bere Forest, and are directed *to resort to the latter and his officers for explanation and information;* of course Mr. Brown being absent. What is the worth of a verdict given under such circumstances?

In spite, however, of the "foregone conclusion" of the referees, their statement on one of the most important points rests solely on information supplied by the Deputy Surveyor: for instance (p. 15) great credit is attached to that officer for his "skill in dealing with difficult local circumstances;" and at p. 16 "the drainage" is said to have been "originally well laid on and abundant," while in the following paragraph the "drainage up to a recent period has been greatly neglected." We doubt the existence of such sagacity on the part of the Commissioners as would enable them to discover from inspection the exact time during which a drain lay neglected, and when it again began to receive proper attention.

The paragraph (page 15), "The amount of income, &c.," is utterly unsound, and proves the determination of the Commissioners to adhere to the good old plan of eschewing all profitable returns. What private gentleman does not consider profit from thinnings a criterion (among others) of good management?

(P. 20.) Where one "dead branch is caused" by *injudicious* thinning, 50 are killed by *defective* thinning. Branches are killed by the *absence* of air and light, not by their presence.

(P. 20.) The intense ignorance displayed by the

Commissioners in their remarks on pruning dead timber is sufficiently exposed in the *Gardeners' Chronicle*. See also remarks on Gs 340, line 9 from bottom

(P. 21.) The proposal to "leave" a few sticks of good Oak timber "to go" with "worthless Beech" in order to sell the latter, is worthy of a rascally auctioneer. Turn an honest penny if you can by selling judicious thinnings, but be assured that if the officers of the forest adopt the suggestion they will proclaim themselves *knaves* by making the offer, but find no merchants such *fools* as to accept it.

Page 23 settles Mr. Lipscombe's case, for though Mr. Kennedy may have "failed to bring any specific charge against Mr. Lipscombe," (p. 22) the very scanty knowledge of the Commissioners has detected enough to justify his decision.

Page 27 appears to be a piece of patchwork—each Commissioner giving his own opinion. One says "the management has for a very long period been dictated by skill, energy, and judgment." Five lines lower down another disapproves of what he considers "a violation of good management." One says it is "a question of controversy (we are not told between whom, certainly no one outside the Royal forests controverts the matter) to what extent underwood may safely be grown in plantations," another is of opinion that any "chance of injury from the introduction of a second crop should be carefully avoided," which chance it appears has been incurred by the care of surveyors "whose management has for a long time been dictated by skill, energy, and judgment." * *

ON THE PRUNING OF FRUIT TREES DURING THE FIRST YEAR AFTER PLANTING.

No rule is without its exception; and the writer of an article on this subject in a late number of the "Revue Horticole" is in my opinion wrong, when he lays it down as a general rule that every tree which has been transplanted ought to be cut down to the height of a foot, or a little more above the level of the soil. Such treatment is very good in some cases but not in others. It seems to me to be very good in two cases, viz.:—

1. When the trees, after being taken from a nursery, have been long exposed for sale; for then their roots are tired, somewhat dried, and the lateral branches have often suffered by carriage from place to place.

2. When the plants that leave the nursery as pyramids have been deprived of their lower lateral members, which are indispensable to the formation of a regular pyramid.

In these cases cutting down is the best mode of treating a Pear tree, whether it be in the shape of a pyramid or of a fan-trained tree; but why have recourse to it when unnecessary? It can be easily dispensed with, as a few examples will show.

In November, 1851, a nursery was destroyed, but all the plants in it, good and bad, were replanted; both plans, viz., cutting down and not cutting down, were tried, and the results obtained by the latter mode of treatment were as follows:—The worst plants were not cut down until the month of March in this year, and their renewed growth was directly proportional to the mode in which they were taken up, and of the state of vitality of their roots; nor did they disappoint the hopes which had been entertained of them.

The good pyramids taken up with care were replanted with all necessary precaution. In March, 1852, they were not cut down but pruned one-fifth shorter than they were before. The flowers which appeared the first year were taken off, in order that the fruit might not absorb the sap which should be expended in the elongation of the wood. In 1853 these pyramids were pruned just as if they had been of old standing, and they produced a certain quantity of fruit. These trees are now in as satisfactory a state as possible. It is true that only the fruit on the vigorous branches has been kept, and that, as in 1852, all the flowers on the more feeble branches have been destroyed. By this means, and by pinching in April, May, June, and July, the equilibrium of the sap has been maintained, and a perfect harmony has been established in the wood of the trees.

It did not appear prudent to delay the pinching until August, as advised by M. Jussiaume; by this time the vigorous buds have gained so much on the more feeble ones that it is too late to establish the equilibrium, which the development of strong parts has destroyed.

The best plan to be followed by those who intend to plant fruit trees is to choose the best formed plants from the neighbouring nurseries, and to plant them from the month of November with the necessary precautions, which are but too often overlooked. Thus if a tree is to be replaced, the old soil should be removed and a new soil rich in humus should be substituted. If at the time of plantation the ground is very dry, it is advisable, when the plant is well in its place at the proper depth, to water the earth at the foot of the tree from a pot with a rose; the roots will thus be consolidated, and will strike before winter.

In November, 1852, some fan-trained Pear trees, and not less than 5 yards in extent, were also transplanted at the same place—Petit Bourg. Treated as above, they recovered perfectly, and this year fruit has been kept on the stronger branches; the quantity exceeded all expectation. The trees were, it is true, transplanted with the greatest care, and then all the roots were taken up for a yard and a half at least from the stem.

The same plan was followed on an occasion when an old orchard (*Normandie*) was destroyed; the trees from it were transplanted here and there in the kitchen garden, and they have yielded excellent fruit.

The pyramids which were not cut down yielded this year as many as eight Pears each, of good quality. Amongst them were some Duchesses (d'Angoulême) which were not less than a foot in circumference, and to all appearance the next gathering will be much more abundant.

These facts lead to the conclusion that cutting down is not indispensable, and that it is not wise inconsiderately to sacrifice that which is useful, and so to defer, for perhaps four years, the production of the means of enjoyment.

I am aware that the necessity for cutting down is attributed to the horizontal position which the lateral branches of the bottom of the pyramid must be compelled to take, in spite of their tendency to grow upwards. But this necessity is by no means so obvious when it is remembered that there are many trees which, without being cut down, have their branches brought from a vertical to a horizontal position by the weight of their fruit. So much is this the case in many instances that the branches have either to be propped up from below or tied back from above. *E. Bardon, in Revue Horticole.*

CONSUMPTION OF FUEL IN THE ROYAL BOTANIC GARDENS, KEW.

My attention was lately directed to an advertisement of Messrs. John Weeks & Co., in the *Gardeners' Chronicle* for Saturday, Jan. 27, last page (and probably it exists in previous numbers), which is calculated to convey very erroneous notions of the consumption of fuel in our Palm-house; and, if true, showing us to be guilty of a most extravagant and unjustifiable use of the public money.

The object of Messrs. Weeks is to prove "the extraordinary efficiency and economy of their heating apparatus," and that, in their establishment at Chelsea, "it does more work with one boiler than is done by 12 boilers in the great Palm-house at the Royal Gardens of Kew." Then he proceeds to draw the following comparison:—

1. THE HOUSES AND PITS AT MESSRS. WEEKS & CO.

Measure in length	1,000 feet
Superficial feet of surface covered	13,480 "
Surface of glass exposed to the atmosphere	16,000 "
Length of pipe to heat the whole	5,000 "
Fuel consumed in 24 hours during the winter months, at a cost of 3*s.* per day	3 sacks of coke.

The boiler requires attention only once in 12 hours, and then but for one hour; thus occupying a man but for two hours out of the 24, at a cost of say 8*d.* per day.

2. THE GREAT PALM HOUSE, KEW,

Measures in length	355 feet (we reckon 362 feet)
Superficial feet of surface covered	23,900 "
Surface of glass exposed to the atmosphere	42,200—we say 45,000 "
Length of pipe to heat the whole 15,000 feet—we say 17,158 feet, besides 1076 feet of tank	
Fuel consumed in 24 hours during the winter months, being two parts coke and one part coal, at a cost of 4*l.* 16*s.* per day	72 sacks

The boilers, 12 in number, occupy the whole attention of two men daily, at a cost say of 10*s.* per day.

It should here be observed that, in the above calculations — inaccurate as we know them to be as concerns Kew—the difference in height between Messrs. Weeks' small greenhouses and pits and the 66 feet of elevation of the Palm-house, along with the tropical heat of the latter as compared with the cool temperature of the houses in the nursery in the King's Road, are facts altogether unnoticed.

Then follows the most astounding assertion:—"It results from the foregoing statements that the apparatus of Messrs. Weeks, with one boiler, is doing about as much work as four boilers do in the Palm-house; and that with three, or, at most, four boilers, such as Messrs. Weeks now have in use in their nursery, the great Palm-house could be heated at a cost, in fuel and labour, of 14*s.* 8*d.* per day, effecting a saving say of 1095*l.* per annum"!!

It is difficult to know the exact data on which Messrs. Weeks found their calculations. We will grant that they expend only 14*s.* 8*d.* per day during the winter months, in their nursery establishment, for fuel and labour. They cannot suppose that if it costs us "5*l.* 6*s.* per diem for the winter months," as they express it, the same expenditure should go on throughout the year.

Allowing then, for

The winter (six) months, at 5*l.* 6*s.* per diem ...		£967 0 0
Summer months (six), say one half...		483 10 0
Cost for the whole year		1450 10 0
Taking Messrs. Weeks' mode on the same principle:—		
Six winter months, at 14*s.* 8*d.* per day	£133 0 0	
Ditto summer	66 10 0	
		199 10 0
		£1251 0 0

By this calculation we are placed in a worse plight than by Messrs. Weeks' showing, to the amount of 156*l.*; for he reckons our loss in fuel and wages at 1095*l.* only. But let us come to facts.

ACTUAL COST OF FUEL AND LABOUR AT KEW.

The average yearly cost of fuel for the whole establishment for the last six years is	£756 0 0
Cost in 1846 and 1847, before the Palm-house fires were lighted, average for two years	394 0 0
Leaving for the Palm-house	£362 0 0

But since 1846 and 1847 the number of fires in the garden has increased considerably, in consequence of new structures, additional dwelling-houses, the Museum, and fires in the Herbarium rooms and Library; so that the Palm-house can in no way be calculated to average more than 300*l.* a year. Thus, then, say—

Fuel...	£300 0 0
2 stokers	91 0 0
Night attendant for eight months	32 0 0
Total cost of Palm-house for fuel and labour...	£423 0 0

Can Mr. Weeks be serious in saying that we could, by adopting his principle of heating, save 1095*l.* per annum out of 423*l.*?

I am far from wishing it to be understood that with the experience we have now acquired we should not be able, had we another such structure to erect, to correct several grave errors, and to economise our fuel; but how a business man like Mr. Weeks could have fallen into such enormous errors and miscalculations as we have here endeavoured to rectify, and how he can tax us with such a gross misapplication of public money, I must leave that gentleman to settle in his own mind. Were it fair to suppose that he has made mistakes of an opposite character in his calculations, and in favour of his own case, the fact might turn out, after all, to be that economy was more practised and paid attention to in the Royal Gardens of Kew than at the Horticultural establishment in the King's Road, Chelsea. *W. J. Hooker, Director, Royal Gardens, Kew, Feb. 7.*

Home Correspondence.

Winter Figs.—Last September, having a number of Fig plants in pots showing a quantity of fruit, I determined to try whether they would continue to grow and ripen through the autumn and winter. With that view, I introduced one plant in a 9-inch pot into an old Pine-stove; here the fruit continued to grow and swell freely, and about the middle of November I gathered the first mature fruit, which was beautifully ripened and of excellent quality. During December and January I obtained abundance of nice fruit, and now, Feb. 5, the little plant has some 200 upon it, in various stages of growth. For nearly three months it has been standing in a dark corner of an old Pine stove, confined in a small pot, and in a humid atmosphere, with little air—circumstances all against the free and full development of such a plant as the Fig is, and during all that time it has borne a succession of nice fruit. Where a house can be devoted to the cultivation of the Fig in winter, with, of course, the essential requirements of light, heat, and air, I am fully satisfied from the above experiment that the Fig will be found one of the best winter fruits we have. *W. Barron, Singleton, Swansea.*

Mildew—A Hint to Rose Growers.—Last autumn I saw two small collection of Roses in pots. The leaves and shoots of one collection were covered with mildew: those of the other were green, healthy, and entirely free from that pest. How can this difference be accounted for? In this way I think. Both collections were plunged—but the mildewed plants merely to the rims of the pots, leaving the surface of the soil in which they were growing, wholly exposed, and they were frequently allowed to get very dry at root. The other collection was not only plunged, but the pots were covered with a couple of inches of rotten manure, which preserved the roots cool and moist. Beyond the simple precaution of securing a constant supply of moisture to the roots of the plants, all other circumstances were equal. The difference in the appearance of the plants was very great indeed. That excessive drought is often productive of mildew there is much evidence to prove. Many of your readers will recollect Mr. Knight's paper detailing his experiment with late Peas. It bears immediately on the point in question, and will be found in his "Physiological Papers." *G. W. L.*

Grafting Rhododendrons.—The questions propounded by "J. R." as to the grafting of Rhododendrons, may be considered as set at rest by the valuable practical observations of Messrs. Standish and Noble; but you will much oblige me if you will insert a paragraph respecting the "best mode and season for grafting." I have found the operation very uncertain. I wish Messrs. S. and N. would do this, and I am sure they would confer a favour on many working gardeners. In their communication the other week they say the shoots for grafting were separated into "single eyes." I can scarcely understand the meaning of this in a Rhododendron. I presume they do not graft the end of the shoot with the leaves. Any information will oblige. *Linda.*

Sweet Scented Camellia (see p. 70).—Mr. Hally says his scented Camellia is a single variety; mine is a double one, and a very good flower, though not so perfect as many other Camellias which I possess. It is of a brilliant rose colour. I have another Camellia which is a more perfect flower in shape, equally double, and of a more beautiful colour, to my fancy, which is scented but very slightly. *Violet.*

The Weather, Feb. 3, 1855.—This morning presents

a phenomenon here which I do not ever recollect to have witnessed before to the same extent. The thermometer about 10 p.m. yesterday marked 10° of frost, which decreased about 11 p.m. It appears that in the course of the night or towards morning heavy rain fell two or three hours, but without the entire cessation of frost. The result is that this morning everything exposed to the rain (which came from the east) is coated with ice. The walls of the garden and house are glazed with a coat upwards of an eighth of an inch thick, and the stems and branches of trees with a still thicker coat. The leaves of all evergreens are similarly coated to the thickness of about $\frac{1}{16}$th, or in some cases nearly ¼th inch, and each has an icicle at its top. I have taken several of these off laurel leaves, which were perfect leaves of ice, the icicle representing a stalk. The trees are of course bent in every direction, and had wind ensued this morning, scarcely anything could have escaped utter destruction, as the weight of the boughs is enormous. The more slender-leaved evergreens, like Red Cedars and Cypress, are converted pretty much into icicles; their bending twigs have frozen together into masses as soon as they came in contact. A slow thaw set in about 10 a.m.; but at the time I write, 1 p.m. the leaves are still covered with pendant icicles —a more severe trial of the hardiness of evergreens I can hardly conceive. If I am not mistaken, a similar occurrence is recorded in the United States, where the accumulation of ice was such as to crush and rend the deciduous forest trees; and I perceive that the deciduous trees are affected, but owing to the absence of wind are not broken. *J. Rogers, River Hill, Seven Oaks.*

W. W. Spicer, Itchen Abbas Rectory, Hants.

Frigi Domo Spoiled by Soaking it in Boiled Oil (see p. 71.)—Your correspondent, who asks how his Frigi domo has been "burnt," may have a solution to his inquiry in the fact of spontaneous combustion. Had the fabric been spread out or hung up openly until it was dry there would have been no danger. In applying boiled Linseed oil to cotton or hempen netting or cloth, the oil is apt to sleek the netting or cloth, and consequently render it less capable of affording protection in case of frost; the better way is to tan the fabrics. *R. Paton, Seedsman, Kilmarnock.*

Materials for Paper.—From the remarks made on Tuesday last, at the meeting of the Horticultural Society, on the Holcus saccharatus (the fibre of which is likely to be useful in the making of paper), it has occurred to me that a fibre of equal value might be obtained from the Sugar Cane after the juice has been extracted. Would it not be desirable to call public attention to the subject!—for should it prove the case, it would produce an almost inexhaustible stock, and be the means of affording a large profit to our West Indian planters. I expect, too, that the leaves of the Sugar Cane will contain as much or more fibre than the stalk. They should therefore not be lost sight of. *H. Groom, Clapham Rise.*

Caution.—We have had in Brighton and its vicinity an artful impostor, who represented himself to be "gardener" to a gentleman at Manchester, who, he stated, had bought an estate at Reigate, and that he was deputed to bargain for extensive ranges of hot-houses, which he has ordered of builders; also plants, shrubs, seeds, &c., of nurserymen. Having had a call from him, I consider it my duty to put the trade on their guard in the matter. He is about five feet six inches high, with dark complexion, dark hair and nearly trimmed whiskers, which are worn under the chin. He wears black trousers, black embroidered waistcoat, dark jacket, a loose over-coat, boots, and a black and green neck tie. He is an Irishman. After leaving Brighton he went to Uckfield, and favoured the trade there with his orders. *Edward Spary.*

Societies.

Horticultural, *Feb.* 6.—The Right Hon. Lawrence Sulivan in the chair. P. Secretan, Esq., A. Mongredien, Esq., and Mr. J. Milne were elected Fellows. It will be gratifying to know that the new regulations adverted to at p. 3, brought together an assemblage of flowers and fruits on this occasion such as the Society never has had before at its meetings in Regent Street. Not only was the meeting room filled with subjects of exhibition, but even the passage leading to it and the secretary's room next the library were full of gay-flowering plants, fruit, and examples of forced vegetables.

Of new plants, Messrs. Veitch had a white flowered Calanthe from Java, an Oncidium nearly related to pubes, and an Ansellia, not remarkable for beauty, from Natal. Messrs. E. G. Henderson showed Genetyllis fuchsioides, an Epacris-like plant with drooping brown bell-shaped flowers, whose only fault was want of brilliancy. That may, however, improve as the season advances.

Epacrises: of these there were several collections, the best of which came from Messrs. Veitch. It consisted of Hyacinthiflora candidissima, Vivid, and Fairbairni. The next in point of merit was furnished by Mr. Todman, gr. to Mrs. Buckmaster. It contained Hyacinthiflora, carnumbrata, and candida compacta. Mr. Ingram, gr. to her Majesty at Frogmore, was placed third. His plants were seedlings of his own, remarkably dwarf and well bloomed. The most conspicuous among them was perhaps Ingrami, a very brilliant scarlet kind. There was also a striking variety of grandiflora, with bright purplish red tubes tipped with white. Mr. Fleming, gr. to the Duke of Sutherland at Trentham, sent candida compacta, a very profusely flowered variety of incarnata, and a seedling called ardentissima. The last-named exhibitor also sent all the way from Trentham three nicely bloomed varieties of Epiphyllum truncatum, all of which, although most troublesome plants to carry, arrived in the most perfect condition, not a branch being broken or a flower bruised. From this it may be inferred that when plants are injured in transport by railway, the fault lies more in want of skill in packing than with the railway company, which is generally blamed for the mischief.

Camellias came from Mr. Higgs, gr. to Mrs. Barchard, and consisted of good-sized trees of Doncklaari, fimbriata, and the larger variety of punctata.

Of Indian Azaleas there were three collections of handsome plants, none of them very large, but all well bloomed. The first, from Mr. Todman, consisted of optima, which is one of the most brilliant of all Azaleas; præstans, and a rose-coloured semi-double kind. The second, from Mr. Fleming, comprised refulgens, a pink seedling, and another. The third group came from Messrs. Rollisson, of Tooting, and contained elata, semi-duplex maculata, which is one of the best of the half-double kinds, and purpurea rosea. Mr. Fleming also furnished two seedlings; No. 1 was a white ground flower, striped and mottled with pink; its fault was reported to be want of substance, which might be owing to the plants having been forced. No. 2 was not so good.

Of Chinese Primulas, the best came from Mr. Green, gr. to Sir E. Antrobus, Bart. These were fringed white and purple sorts, well bloomed. Mr. M'Ewen, gr. to the Duke of Norfolk at Arundel Castle, sent the second collection, and a third group was furnished by Mr. Chilman, gr. to Mrs. Smith, of Ashtead House, near Epsom.

Orchids were exhibited in great profusion, and in remarkably good condition. Messrs. Rollisson produced Angræcum eburneum, a magnificent specimen of this, when well grown, really handsome Orchid from the forests of Madagascar; a less conspicuous variety of it called virens, Vanda suavis, Lælia superbiens, with a noble spike of handsome flowers; Leptotes bicolor, quite carpeting the whole top of the pot with flowers; the White Butterfly plant (Phalænopsis amabilis) and a Eulophia, of no great beauty, from Java. Messrs. Veitch sent Barkeria Skinneri, Oncidium Cavendishi, Angræcum eburneum, Ansellia africana, Cœlogyne cristata, a most useful winter flowering species, &c. Mr. Woolley, gr. to H. B. Ker, Esq., sent Epidendrum rhizophorum, a species with Apricot coloured flowers like those of cinnabarinum —a colour so rare among Orchids; Phalænopsis amabilis, Epidendrum Skinneri, Calanthe vestita, the yellow-eyed variety, which is not near so handsome as the crimson-eyed sort, Angræcum virens, and a prettily flowered plant of Cypripedium insigne. From Messrs. Jackson, of Kingston, came a collection consisting of one of the best varieties of Lycaste Skinneri, the somewhat rare orange coloured Calanthe curculigoides, the pretty Odontoglossum membranaceum, and one or two other species.

Of single specimens Messrs. Veitch showed Epacris hyacinthiflora, and Mr. Todman had a good plant of Eriostemon myoporoides, which was, however, hardly sufficiently advanced in bloom.

Of Late Grapes there were several capital exhibitions. The best of these came from Mr. Forbes, gr. to the Duke of Bedford, at Woburn. They consisted of Black Hamburgh and West's St. Peters, both in an excellent state of preservation—scarcely, in fact, distinguishable from new Grapes. The next best exhibition was three bunches of Muscats from Mr. Clark, market gardener, Turnmoss, near Manchester. These were every way as good now as the beautiful bunches of this variety of Grape which were shown by Mr. Nash in December last. Mr. Snow, gr. to Earl de Grey, sent Black Barbarossa, which, though plump, was a little deficient in colour. Mr. Butcher likewise sent bunches of this Grape, as did also Mr. Fleming. Mr. Ingram furnished bunches of West's St. Peters, and Mr. Jennings, gr. to the Earl of Derby, Black Hamburgh. Black Barbarossa came from Mr. Morrison, gr. to A. Donaldson, Esq., and Mr. Page, gr. to W, Leaf, Esq. The latter also sent fair bunches of Muscat of Alexandria. Muscadine and Black Prince (!), both very much shrivelled, were shown by Mr. M'Ewen, gr. to Colonel Wyndham.

Of Early Grapes, Black Hamburghs, not very large, but well coloured and covered with a beautiful bloom, were contributed by Mr. Forbes, of Woburn.

Pine Apples:—Mr. Fleming showed a variety called Charlotte Rothschild, weighing 4 lbs. 4 oz., and a smooth-leaved Cayenne, weighing 4 lbs. A fruit of Charlotte Rothschild, weighing 4 lbs. 3 oz., was also exhibited by Mr. Dodds, gr. to Col. Baker, who gives this variety the character of being an excellent sort alike valuable either for winter or summer growth. Mr. James, of Pontypool Park, had a smooth-leaved Cayenne, weighing 4 lbs. 12 oz.; Mr. Bailey, Shardiloes, an unnamed variety, weighing 4 lbs. 2 oz.; Mr. Ingram, a Queen, weighing 13 lbs. 3 oz.; and Mr. M'Ewen, of Arundel, a Ripley Queen, 2 lbs. 6 oz. in weight.

Apples consisted of two collections, one from Mr. M'Ewen, of Arundel; the other from Mr. Snow, gr. to Earl de Grey. The latter had Blenheim Pippin, finely coloured, Golden Noble, a large yellow Apple, Ribston Pippin, Old Golden Pippin, Court Pendu Plat, and Young's Golden Pippin. Mr. M'Ewen had, in addition to these varieties, the Cockle Pippin, Golden Harvey, or Brandy Apple, and the King of the Pippins.

Pears.—Beautiful specimens of Easter Beurré, Glou Morceau, and Ne Plus Meuris, were shown by Mr. Tillyard, gr. to the Right Hon. the Speaker, at Heckfield. The same exhibitor also sent (but not for competition) examples of Winter Nelis, Beurré Rance, Susette de Bavay, Passe Colmar, and Knight's Monarch, all in a fit state for table. Mr. Snow, gr. to Earl de Grey, had the next best lot in point of merit. It consisted of Glou Morceau, Chaumontel, and Easter Beurré, all very fine fruit. Mr. M'Ewen, of Arundel, produced Easter Beurré, Beurré Rance, and Passe Colmar. Mr. Robertson, Stoke Edith Park, sent Chaumontel, large and beautifully coloured, Easter Beurré, and Glou Morceau. Finally, Mr. Bloore, gr. to the Rev. J. J. Hornby, contributed examples of Glou Morceau, Beurré Rance, and Winter Crassane.

Forced Vegetables.—Mr. Ingram furnished an excellent collection from Frogmore, consisting of Asparagus, large and fine, Seakale, French Beans, Mushrooms, Rhubarb, and Tomatoes. Mr. M'Ewen, of Arundel, had the next best set, which comprised small Kidney Potatoes, Fulmer's French Bean, Seakale, Asparagus, considerably smaller than Mr. Ingram's; Mushrooms and Rhubarb. The same exhibitor also sent a forced salad, containing Sion House Cucumber, Celery, Brown Cos Lettuce, Endive, and Mustard and Cress. Mr. Fleming sent Mushrooms and a box of Seakale.

Miscellaneous subjects of exhibition consisted of the following:—A collection of plants remarkable for fine foliage from Messrs. Henderson, of Pine Apple Place; a similar group from Messrs. Henderson, of Wellington Road; Lachenalias and Cinerarias from Mr. Todman; Acacia dealbata from Mr. Higgs; Lambert's Cone Apple, a sort resembling a small Cockle Pippin from J. Disney, Esq.; two seedling Apples from Mr. Smee, nurseryman, Halstead; a dish of Cuthill's Black Prince Strawberry, from Mr. Brown, of Waltham Abbey; seedling Potatoes of 1851 from T. L. Popham, Esq.; Brussels Sprouts, remarkably fine specimens, from Mr. M'Ewen; Holcus saccharatus, in a green state, and bearing seed, from Mr. Ingram, of Frogmore; also dried stalks of it and a sample of its fibre from Mr. Henderson, of Kingskerswell. In addition to what will be found at p. 35, respecting this plant, it was stated that its fibre, after the juice is pressed out of it, has been ascertained from paper-makers in this country to be worth at least 10*l.* a ton. A root and figure of the Potato Yam (Dioscorea Batatas) from M. Decaisne were also exhibited. The root was about the size of a well grown Parsnip, but, unlike that vegetable, in this case the thick end is that which pushes its way into the ground. It can only therefore be grown with advantage on ridges, and in deep light land; when first taken up this root was said to weigh about 3 lbs. A model of a rising stage came from Mr. Smith of Hummanby Hall, near Scarborough, Yorkshire. The shelves in this contrivance were moveable, and were susceptible of being raised towards the glass with the plants on them, or lowered at the will of the cultivator. It was considered that it might be useful in certain cases, more especially if machinery could be applied as the moving power instead of manual labour. Mr. Miller, gr. to Sir W. Smith, Bart., of Eardiston, sent a plan of a span-roofed pit or Vinery, 120 feet long and 15 feet wide, heated with hot water. This house is used as a Vinery in summer, and as a kind of vegetable garden, *i.e.*, a place for raising forced vegetables, and keeping plants in in winter, means being provided for turning the tops of the Vines out of doors during that season. It was thought to be worthy of commendation on account of its apparent simplicity of construction and general usefulness. Mr. Munro, gr. to Mrs. Oddie, showed a boiler for a hot-water apparatus, together with a plan of the same. It was a square box about a foot or so deep, filled with flue-pipes. It exposed a large surface to the action of the fire, and appeared to be altogether good in principle; the inventor was, however, recommended to try it in some public garden where attention could be called to it, and a report of its working capabilities obtained. Finally, on the walls of the meeting room, were suspended the drawings of Wellingtonia employed by Mr. Bateman in the interesting lecture fully reported in our columns of last week.

From the garden of the Society came among other things an example of a wild Hyacinth from Cabul. It was stated that this, which is little handsomer than a common Blue Bell, was in all probability the parent of the beautiful Dutch Hyacinths now cultivated everywhere.

The medals, &c., awarded on this occasion will be found in our advertising columns.

Notices of Books.

Pescatorea. Iconographie des Orchidées de la collection de M. Pescatore, au château de la Celle St. Cloud, parts 2, 3, and 4. Folio.

Three new numbers of this fine book have just reached us. We learn with much regret that the delay which has occurred in their delivery arises from the difficulty of finding an English bookseller willing to undertake the publication of so large and valuable a work upon conditions which its price and circulation will permit the authors to bear. It it to be hoped, however, that some arrangement will be made so as to enable the English

subscribers to receive with punctuality so beautiful a publication, which is indispensable to all lovers and growers of Orchids.

The numbers now before us contain figures of *Odontoglossum Cervantesii*, var. *membranaceum; Warcziewiczella marginata*, Rchb. f., of which the *Warrea quadrata*, Lindl. is a synonyme; *Cœlogyne asperata; Vanda suavis*, a beautiful white form, with crimson stains; *Odontoglossum navrina*, which is to be succeeded by figures of the yet finer *O. gloriosum* and *præstans*, *Cataseum sanguineum*, *Warcziewiczella candida*, Rchb. f., or *Warrea candida*, Lindl.; *Angræcum Brongniartianum*, Rchb. f., a glorious plant in the way of *A. virens* and *eburneum; Cattleya citrina*, a beautiful specimen from the garden of Mr. Consul Schiller, at Hamburgh (we have never seen so fine a specimen in this country); *Barkeria elegans; Odontoglossum hastilabium*, and *Renanthera matutina*. The work continues to be enriched with the learned scientific observations of M. Reichenbach, jun., the practical horticultural counsels of Mr. Luddeman, and an accurate general history of the plants in their wild state by Mr. Linden, who is the chief editor, and to whom those who wish to procure this really noble work should address themselves *au Jardin Royal de Bruxelles*.

The *Album Vilmorin*, another magnificent work, in elephant folio, published in Paris, contains highly finished representations of the principal hardy annual and perennial flowers, vegetables, and agricultural plants cultivated in France. The 185th number is now before us, containing two plates, one representing kitchen garden produce, the other a group of flowers. It says a great deal for the wealth of France that such bulky, costly works find purchasers enough to defray the large expense of publication. Those who are unacquainted with this album will be surprised to see how well the roots of Turnips, Leeks, and Beets look upon paper.

Victoria Regia; or the great Water Lily of America. By John Fisk Allen. Elephant folio, Boston, U.S.

In 17 pages of the largest elephant folio size, with six carefully coloured plates, and all the luxury of fine paper and beautiful typography, Mr. Allen has published an elaborate history of the discovery of the Victoria Lily, of the steps by which it became known to science, and of the conditions under which it flowered in the United States. His task has been executed in a manner worthy the Royal flower, and we congratulate him in having so much zeal for horticulture as to put upon record in this magnificent manner the facts connected with the first introduction of the plant to the United States. Mr. Allen's work shows, like other modern productions of the American press, that in art as well as in science Europe has to encounter for the future a rival worthy of the most advanced of her old countries, and already ahead of those which stand in the second rank.

FLORICULTURE.

Dahlias.—One of your correspondents says (see p. 56) that the best flowers are obtained from plants struck from the first cuttings produced by the parent plant; this is, however, by no means the case. He also says, thus it is that good flowers are obtained with the least trouble from those plants which are kept in pots the first season after striking, and which are termed by the trade "pot roots," being planted out the following season, and allowed to start of their own accord. What I would ask is, Which is the least trouble? To strike them one year and plant them, or to strike them, then keep them in pots through the summer, and plant them the following spring. I have grown Dahlias for these last five years, and have exhibited them, and I know from experience that your correspondent is decidedly wrong. Let those who like his plan try some plants on the old system next summer, and judge for themselves. The usual way is to put the old roots if possible in a moderate heat, but a dry one; for if any of the tubers are at all unsound, they are very likely to cause the decay of the whole plant if placed in a moist heat; as soon as the cuttings are about 4 inches long let them be taken off the old root, placed in thumb pots, putting a little silver sand immediately under the cuttings; then let them be placed in a moderate heat again, and shaded when needed, and they will strike in about a fortnight. When well rooted they should be placed in larger pots, and gradually hardened off till the time of planting; if some of these be planted by the side of those on your correspondent's plan, the latter will no more be adopted, for this reason:—the pot plants, having a number of eyes, continue throwing up suckers the whole season, which in the case of some sorts would deteriorate their quality very much, especially those kinds which are close in the petals. *J. M. M.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Any of the climbers that are found to be growing less vigorously than it is desirable that they should do will be benefited by having as much of the old soil removed from their roots as can be done with safety, replacing it with good fresh fibry materials. Ipomœa Leari, which is one of the most showy twiners in a close roofed house which we know of, requires to have the soil frequently renewed, or the old plants may be destroyed, the soil renewed, and good strong young plants turned out in April. Stove.—Plants in active growth requiring more pot room should be repotted, and many of the young stock just starting into growth will be benefited by a shift; but arrangements should be made for doing this without exposing the plants to the temperature of a cold shed, and there should be a good supply of soil at about the same temperature as that in which the roots have been growing ready for use when wanted. The whole of the repotted plants should be placed where they can be readily examined, so that they may be carefully supplied with water for a few weeks after repotting, and they will be benefited by a gentle sprinkling with the syringe on the mornings and evenings of bright days; but use the syringe sparingly during cloudy weather. Any of the Orchids that may be starting into growth should be repotted or top-dressed as may be required; for if this is deferred long after the commencement of growth, there will be great danger of injuring either the buds or young rootlets. Give a gentle syringing to plants on blocks, but only sufficient to prevent shrivelling.

FORCNG DEPARTMENT.

Pineries.—Where the bottom-heat is maintained by means of fermenting materials such beds as may have been recently renewed should be carefully watched, and if the heat at the bottom of the pots is found to exceed 90° the pots should be slightly raised in order to prevent injury to the roots. It is not usual now to subject the roots of Pines to a temperature of 110° or more, as we have seen growers of the old school quietly doing, but it is still to common a practice to allow the bottom-heat at times to become too strong, throwing the plants prematurely into fruit or otherwise injuring them. Indeed we believe that more harm is done to Pines by too much bottom-heat than by any other cause, and success cannot reasonably be expected while the roots are occasionally subjected to a baking heat. Maintain a steady bottom-heat of about 85° during the growing season, but depend upon it that 90° cannot be exceeded with safety. See that the soil about the roots of growing plants is not allowed to become too dry, and secure a moist state of the atmosphere, but use the syringe carefully, until the sun becomes more powerful to dry the hearts of the plants. Vineries.—The weather for some time past has been anything but favourable for early forcing, and the most careful attention will be necessary with houses where the Vines are fairly in leaf. Take every opportunity to admit fresh air to strengthen the shoots and foliage, &c.; but do this cautiously, and by small openings near the heating apparatus, and shut up early in the afternoon, letting the glass rise to 80°. Where the Vines are in bloom, let the night temperature range between 60° and 65°, raising it 10° by day, and Muscats need hardly be expected to set well unless they can be kept some 5° warmer; but it will be better in every case to let the temperature sink a few degree on sharp nights than to over heat the pipes, and render the atmosphere unhealthy. While the syringe cannot be used the evaporating pans must be kept at work, and the floors, &c., sprinkled in the morning or as often as may be necessary to secure a moist state of the atmosphere; for unless this is attended to, red spider will be very apt to make its appearance. But, perhaps, the great cause of red spider is an unhealthy root action, producing thin, weakly foliage, which despite the most careful internal management is sure to be attacked by this pest, therefore use every means to secure a dry, warm state of the borders. Give Vines in pots a liberal supply of manure-water in a tepid state.

HARDY FRUIT AND KITCHEN GARDEN.

Preparations should be made for getting in the main crop of Potatoes as soon as the weather and the state of the ground have become favourable. The experience of past years should have taught every person the impropriety of planting these upon fresh manured land, and although a heavy crop of the weakly early sorts cannot be obtained, except from land in good condition, the use of strong manures should be avoided even for these. By selecting a piece of ground that was well manured last season for a green crop, and giving this a good dressing of charred vegetable refuse or wood ashes, previous to planting the Potatoes, it will be less likely to favour an early attack of disease than if rich stimulating manure was used. And, except for very weakly growing varieties, the soil of most gardens is too rich to produce Potatoes of anything like quality. Push forward all kinds of wheeling while the ground is in a favourable state for such work. Soils of a heavy tenacious character are improved for working the more they can be exposed to the action of frost, and some persons dig such ground a second time, turning in the frozen surface, in order to expose a farther portion to the action of the weather; but where it may be desirable to do this the frozen part should not be dug in deep. Look well to the protection of Lettuce, Cauliflower, &c., under glass, and take every opportunity of exposing such things to air. Some of the strongest roots of early Rhubuarb might be covered with pots or boxes, and sufficient leaves and stable litter to produce a gentle warmth, this would save injuring the roots by removing them for forcing, but where there is a good stock of roots this is of little consequence, and is hardly worth the trouble and litter which it causes. Get ground prepared by heavy manuring and trenching for fresh plantations of Rhubarb, Seakale, and Asparagus, and remember that the ground for these things can hardly be made too rich.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Feb. 8, 1855, as observed at the Horticultural Gardens.

Feb.		Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth 1 foot deep.	Temperature. Of the Earth 2 feet deep.	Wind.

The highest temperature during the above period occurred on the 17th, 1831 — therm. 59 deg.; and the lowest on the 11th, 1845 — therm. 1 deg. below zero.

Notices to Correspondents.

Arnott's Stoves: *Henry.* They are little used now. Undoubtedly any ironmonger in a large way can supply you.

Bonapartea: *Wm. Link.* Your plant appears to be right. All you need do is to take care that it neither damps off nor catches cold. Give it all the warm air you can command.

Books: *S B.* The new edition of the "Theory of Horticulture" will be ready in a few weeks; it has reached p. 304 in the printer's hands. It is not intended to publish it in numbers. If you have as much as 5*l.* to spare for an English Dictionary you had better buy Richardson's, which some good-natured bookseller will let you have for less money than that.

Calandrinias: *X Y Z.* C. umbellata is an annual; discolor is a half shrubby greenhouse plant, which however does very well as a bedding out plant.

Camellias: *Sub, &c.* Cold and imperfect drainage often cause the buds of these to drop off, and even a scarcity of water after they are formed will produce the same effect. Another reason why Camellias drop their buds is leaving too many on the plant. Some varieties produce twice as many as they have strength to expand, the consequence of which is if they are not picked off at an early period they will drop off, and those that remain will often be deformed and small. If, therefore, you want good blooms, you must not permit too many buds to remain on a plant.‡

Dioscorea: *Sub.* The tubers of this sent out by the trade vary from the size of Peas to that of Hazel nuts.‡

Diseases: *T D H.* The disease on the leaves of your Oncidium appears to be of the same nature with those noticed under the initials "J. R." and "H. W.," Jan. 27, 1855. The whole plant seems to be affected, and if that be the case it is very doubtful whether you will find any remedy. It is evident at least that the present condition of your house does not suit the species, though there can be nothing radically wrong about it, or many other species would suffer. Your best chance is probably to alter the position of your plant in the house, and, if possible, to move it to some drier spot, if, as is apparently the case, the leaves are unusually succulent. It is however obvious that, without seeing the matter *in situ*, one can only guess at the conditions which may have induced disease, or the remedies which the case might suggest. *M. J. B.*

Erythrolæna conspicua: *O P.* asks if this plant is lost. We have not seen or heard of it for many years.

Ferns: *G A.* The specimen arrived safely, and is under examination by a friend, who will in time give us his opinion.

Grape Mildew: *M D.* inquires whether any of our readers can inform him whether the sulphuret of potash has been used as a remedy for the Grape blight. We have some idea that such a proposal has been made, but we are unable to find it recorded.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* Letter of January 6 received. The arrival of the parcels will be immediately notified. Very happy indeed to hear that you are about to visit England.

Orange Trees: *A Sub.* We foresee no risk provided you do not use gas-tar, but merely employ pitch, properly so called, along with grease.

Prices of Digging. Received a *Northern* and *Bedale.*

Publishers: *A R.* Your question is, we apprehend, purely legal, and therefore beyond our province. We suspect you have no remedy in the absence of a special contract. Such occurrences are very common abroad, but we have never been able to obtain any satisfaction. The remedy we seek is not to take books in in numbers, but to wait for the completion of a volume, unless we know the author or publisher.

Rabbits Barking Trees: *V.* The following is said to be a good way of preventing the mischief. To 1 gallon stale urine add 1 quart powdered lime, and 1 pint foreign tar; warm the tar to mix with the above, then add as much cow dung as will bring it to the consistency of thin paint. Apply it to the trees with a painter's brush.‡

Raspberries: *Hortus.* These may be forced so as to be ripe with forced Cherries; the great difficulty is to prevent their growing too fast and becoming blind. We dare say some obliging correspondent will give you his practical experience in the matter.

Transplanting Evergreens: *B A C.* We would recommend you to wait till next August or September.‡

Vines: *L R L.* If your plants make good wood under the present management we should continue it without alteration. Stable litter will probably cause your soft-wooded plants to damp off. If liquid manure is wanted for the Vines make it by putting two double handfuls of guano into a pail of water; stir it a few times in 48 hours; then let it stand till it is clear, when it may be used, one pailful to each Vine. The sediment will be good manure for turning in to the kitchen garden borders—for Onions, Turnips, or other root crops.

White Blackberry: *A W.* This is an American, not English, plant.

Woollen Netting: *J H.* We would prefer 1-inch mesh to 2 inches. Mr. Harrison's, if we recollect rightly, is something less than 1 inch. We never recommend dealers.‡

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London; and from all the other Agents of the Company.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure specially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204A, Upper Thames Street, London.

CYANIC MANURE COMPANY.
WHITE'S PATENTS.
OFFICES, 37, CHARING CROSS, LONDON.
Directors.

The Hon. J. W. Fortescue.	General Macdonald, C.B.
G. P. Irvine, Esq.	Newton S. Scott, Esq.

Bankers—Messrs. Herries, Farquhar, & Co., St. James's Street.
Solicitors—Messrs. Vallance & Vallance, 20. Essex Street, Strand.
Agricultural Chemist—W. White, Esq.
Secretary—Mr. W. F. Mould.

Patent Cyanic Manure ... ... 8*l.* per ton.
" " Deodorising Powder ... 15*s.* per cwt.
" " Plant Preservative ... 12*s.* 6*d.* per cwt.

The Directors have the satisfaction of announcing that their arrangements will now enable them to execute orders to any extent. Applications for Agencies to be accompanied by references. Orders to be addressed to the Secretary, 37, Charing Cross, London.

THE MANCHESTER SEWAGE GUANO COMPANY respectfully inform Agriculturists that they have made arrangements which will enable them to meet the increasing demand for their Manures. The MANCHESTER SEWAGE GUANO is a compost of Blood, Bones, Urine, Nightsoil, and other Animal Matters, and highly fertilising Chemical Ingredients, which are in a concentrated state incorporated with Animal and Vegetable Charcoal, ground to a fine powder, *the whole forming a dry portable Manure.* It is free from all kinds of Seeds, Weeds, &c., and enriches the land to a considerable degree for several years after it is used. Price 5*l.* 5*s.* per ton. Net cash on delivery. Carriage free to any Railway or Canal Wharf in Manchester.—JOHN THOMPSON, Secretary, 3, Watling Street, Shudehill, Manchester.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and other purposes of the best quality at a reasonable price.—Address INGLIS & CHISHOLM, Charles Street, Garratt, Manchester.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.
IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.

COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.

Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.

WARMING AND VENTILATING.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1	12	0
2¾ "	long 3 " 3 "	gutta percha,	1	15	0
3 "	ditto 3 " 6 "	or cast iron	2	12	0
3½ "	ditto 3 " 6 "	flanged pipe,	2	18	0
4 "	ditto 3 " 6 "	as required.	3	5	0
2½ "	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto ditto		2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4*s.* 6*d.* each; Four Tine Forks, 5*s.* 6*d.* each. A liberal allowance on Wholesale Orders.
WILLIAM DRAY & CO., Swan Lane, Upper Thames Street, near London Bridge.

NEW AND IMPORTANT LEVELLING INSTRUMENT.

GILLESPIE'S PATENT INCLINOMETER, for Taking, Fixing, and Adjusting Surface Slopes of Lands, Earthen Embankments, Railway Gradients, &c., and the Dip, Outfall, or Rise of Drains, Water Courses, &c., and universally applicable to determine the plans and aid the execution of all levelling or sloping operations known in civil engineering.

PRICES:—Inclinometer, with mahogany frame and brass mounting ... ... £3 3*s.* 0*d.*
Do. with oak frame and wrought iron mounting 2 12 0
Light Telescope, 10*s.* 6*d.* extra.

TESTIMONIALS.

From Mr. James Gentles, Contractor.—"I have for a considerable time past used Gillespie's Patent Inclinometer in extensive drainage operations carried on by me, and I have found it to be of the greatest service, in showing the minutest slope in the ground, and in saving of labour; and I could not have constructed many of the drains with any degree of accuracy without its assistance."—James Gentles, Hart Hill, by Whitburn.

Extract of a letter from John Mitchell, Esq., Stand Hill, Bathgate.—"I highly appreciate its capabilities as a levelling instrument. In level lands, where there is a difficulty in detecting in which direction the land slopes, it is invaluable."

Extract of a letter from Mr. John Turner, Surveyor, Whitburn.—"The more I have tested it the more have I appreciated its value. By this invention the power of levelling is brought within the reach of all men of ordinary capacity."

Sold by WILLIAM DRAY & Co., Engineers, &c., Swan Lane, London. Specimens and Models may be seen at their Warerooms. Also a Descriptive Treatise on the nature and uses of the Patent Inclinometer, and copies of Recommendations of its efficiency and value to be had on application.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.

MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.
Canonmills Bridge, Edinburgh.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

"FRIGI DOMO," a Canvass made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey, and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.

DIRECTORS.

HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

John C. Cobbold, Esq., M.P.	William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S.	Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq.	Samuel Morton Peto, Esq.
Thomas Edward Dicey, Esq.	William Tite, Esq., F.R.S.

William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

AGRICULTURAL EDUCATION.—The Advertiser, desirous of forming a first-class School for the education of Boys, specially for Agricultural pursuits and the Colonies, would be glad to share the undertaking with a gentleman holding farm and house suitable for the purpose.—Address Mr. FREDERIC ILIFF, Queenwood College, Stockbridge, Hants.

PRESENT PRICES OF AGRICULTURAL SEEDS.—SEE MESSRS. SUTTON'S DESCRIPTIVE LIST, on the last page of this day's *Gardeners' Chronicle.*

The Agricultural Gazette.

SATURDAY, FEBRUARY 10, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, Feb. 14—Agricultural Society of England.
THURSDAY, — 15—Agricultural Imp. Society of Ireland.

EVERY profession has its enthusiasts; and agriculture in all its departments has them in abundance. Of those who are especially interested in *cultivation* we have teachers of deep and of shallow culture—of tilth without manure—and of manure applied in the liquid form, or as top-dressings in the solid form. In other divisions of the subject we have devotees of plant improvement and of animal improvement. Poultry has absorbed the whole regard of many; and there is many an ill cultivated farm occupied by men celebrated as breeders of stock, to prove that it also often too exclusively engages all the energy of the tenant. Agricultural improvement owes a great deal to enthusiasts. It makes progress piecemeal in the hands of those who are

thus interested in but pieces of its whole extent. If it had not been for BAKEWELL and for COLLING, the one giving a lifetime to the improvement of the sheep, and the other to the improvement of the Teeswater breed of cattle, not only would sheep and cattle not have been what they are, but British agriculture generally would not have attained its present powers as the food supply of more than 20 millions. Amateurs as well as farmers may therefore all feel well disposed towards agricultural enthusiasts.

The present value of the short-horn breed is the result of an enthusiasm commencing with the COLLINGS, but extended now over the owners of hundreds of herds—many as good as theirs. And the preservation of the present value of the breed depends upon the perpetuation of this feeling. That it is still as strong as ever there is abundant evidence. Mr. TOWNELEY might be called, or might send his herdsman, as witness to it; and an amusing illustration of it in another quarter was given to us the other day by Mr. STRAFFORD. As the editor of the short-horn herd book, Mr. STRAFFORD receives, of course, the earliest intelligence regarding every varying phase of the short horn breed. He is, as it were, the focus where one best can estimate the character and force of that particular branch of agricultural enthusiasm which that breed exhibits. When in his company the other evening, the following note arrived from the intelligent steward on the Earl's Court Estate, Old Brompton, the property of Mr. GUNTER. Mr. KNOWLES had charge of the Tortworth herd for several years, and may be allowed the feeling of satisfaction which dictated the following intimation:—

"The Steward's Cottage, Earl's Court, *Feb.* 1, 1855.

"DEAR SIR,—I have much pleasure in announcing the birth of a rich roan cow calf, last night, from the Tortworth Duchess. Both the infant and her Grace the mother are progressing favourably. I am, dear Sir,

"Yours truly, JAMES KNOWLES."

This calf is from Duchess 67, sold a yearling at the Tortworth sale for 367*l.*; and its sire is fourth Duke of Oxford, 11,387—a bull sold by Lord DUCIE to Mr. SAINSBURY, of Corsham, got by Grand Duke, the thousand guinea bull sent to America by Mr. BOLDEN, of Lancaster. The dam of the fourth Duke, namely, Oxford 6th, is also in America. In fact, nearly all of the Duchess blood are on the other side of the Atlantic. Mr. GUNTER and Mr. BOLDEN are the principal owners of the Duchess family in England. Mr. GUNTER has in his possession Duchess 67, bought a yearling at the Tortworth sale for 350 guineas, and her calf referred to in the note above—one of the most vigorous young quadrupeds that ever puzzled those who condemn in-and-in breeding. He has Duchess 70, purchased a calf at Tortworth for 310 guineas; and he has Duchess 69, purchased by Mr. TANQUERAY at the Tortworth sale for 420*l.*, and since sold by him to Mr. GUNTER for 525*l.* The calf from Duchess 67, by the fourth Duke of Oxford, unites in herself the blood of the best families of the short-horn breed, and the satisfaction expressed in the note that we have published, will be perfectly understood and sympathised with on both sides of the Atlantic!—Mr. BOLDEN owns two heifers, by the Grand Duke, from the fourth Duke of York's dam, Duchess 51; and he also possesses Grand Duke 2d, a very promising young bull, son of Duchess 64, sold at Tortworth for 600 guineas. It may illustrate the high market value of this blood to state that 500 guineas were offered for this young bull when a calf of a few months old.

We must not forget, however, that the short-horn breed includes many other families and herds of pure descent. The prices received at the sales during the past year have not equalled those of the previous year, partly because American competition—to which many heavy prices given have undoubtedly been due—has been directed chiefly to animals of the Oxford and the Duchess blood, but also because a second Tortworth sale has not happened during the past 12 months, and is not likely to occur again, even though we understand Mr. TANQUERAY's fine herd at Hendon is soon to be disposed of. The only sale of Duchess blood, of which we have heard, has been in the case of Duchess 69; and there the price (525*l.*) has been independent of competition; American influence cannot be pleaded in explanation. This is the highest price given during the year. The following are other prices that have been received, and if the exceptional character of Lord DUCIE's sale be taken to exclude it from consideration, it may be concluded, we think, that the value of the breed has not fallen in general estimation.

Application for information on the sales of the past year was made to Mr. WETHERELL, of Durham; and Messrs. GANLY & SON, of Dublin; and to Mr. STRAFFORD; and from the last-named gentleman we have received particulars of 17 sales—almost the only ones of any consequence in 1854—conducted by himself. The following is a short summary of the chief points which they exhibit:—

1854.	NAMES AND PARTICULARS.	Number Sold. Cows and Heifers.	Number Sold. Bulls and Calves.
April 11	Mr. Cartwright, of Aynhoe, Northamptonshire ... ... Among the prices were 56, 57, 59 guineas for cows; 40, 48, 41 for bull calves.	20	10
April 13	Mr. Wilkinson, Lenton, Notts ... ... 165 guineas were given for Phœnix, 130 for Zealous, 90 for Wiseton Lady, 90 for her daughter Roan Lady, 110 guineas for Lavender 3d; and among the bulls, Splendid fetched 110 gns., Monarch 75 gns. Amount of sale about 3000 gns.	50	15
April 27	Sir J. Lubbock, Kent ... ... Sold for 600 guineas! Prices went very low. Several have since been sent to Australia: at of course higher figures.	21	13
May 3	Mr. Adkins, Stratford-on-Avon ... ... Amount of sale, 1500*l.* General a bull fetched 70 guineas, and several cows reached sums between 40*l.* and 60*l.* Twenty pure bred animals of Mr. Goode's were sold after this sale on the same day.	39	10
May 24	Mr. Grant Duff, Aberdeenshire ... ... The amount of the sale was about 2000*l.* Several high prices were attained; Jenny Lind, 7 years old, fetched 100 guineas; Miss Bates and Miss Bates 24, 66 and 75 guineas; Pure Gold, 91 guineas; and Manganese 90; Monika and Iris, 95 each; and Lady Love for 110 guineas. Several bulls reached prices over 40 and 50 guineas.	30	14
June 7	Mr. Fawkes, of Farnley Hall, Yorkshire, annual sale ... ... Amount 527*l.*, a very high average for bulls.	0	8
July 14	Sir C. Knightley, Northamptonshire ... Amount, 571*l.* The prices, though many of them ranged above 50 guineas, were considered low.	0	15
July 18	Mr. Champion, Retford, Notts. ... ... Realised between 1400*l.* and 1500*l.* The prices ranged, for cows and heifers, between 40*l.* and 100*l.*; one fetched 130*l.* Two of the bulls fetched 52 and 60 gs.	30	5
Aug. 24	Mr. Kirkham, of Hagnaby, Lincolnshire.. The amount was near 3000*l.* Many of the cows realised prices between 50*l.* and 70*l.*; one fetched 160 guineas. Among the bulls and calves, 65, 72, and 100 guineas were obtained.	70	15
Sept. 5	Mr. Bolden, of Lancaster, sold for 415*l.* ... 50, 90, and 100 guineas were obtained. Mr. Carr, of Settle, sold a few on the same day.		7
Sept. 6	Mr. Dickenson, Ulverston, sold for 700*l.* 40*l.*, 51*l.*, and 60*l.* were reached.	27	6
Sept. 20	Mr. Ladds, Huntingdon, sold for 1700*l.* ... One bull fetched 105*l.*; the highest cow was 60 guineas.	54	12
Sept. 21	Mr. Abbey, Wellingborough ... ... Hardly realised 1000 guineas; one yearling calf sold for 35 guineas.	50	
Sept. 27	Lord Monck, county Wicklow ... ... Sold for 800*l.*	25	5
Sept. 28	Mr. Topham, Dowestown, Co. Meath ... Sold for 1850*l.* The highest price was 110*l.* for a cow; and 10 or 12 others ranged between 40*l.* and 60*l.*	58	12
Oct. 12	Mr. Dickenson, Willesden ... ... Sold for 1200*l.*	36	
Oct. 19	Lord Exeter, Stamford ... ... Sold for 700*l.*	27	8

Here, then, are 155 bulls and bull calves, and 537 cows sold for about 22,000*l.* This has, in fact, been an average year as to number and as to prices, and the number and the value are sufficient to indicate the national importance of the short-horn stock. Neither the one nor the other are of course the complete index which we should like to have. Private sales doubtless exceed in number, and we have seen, in the case of Duchess 69, that they sometimes exceed in prices given those submitted to and reached at public auction. The interests of breeders, after all, depend more upon the former than the latter; and the more numerous the herds, the more general the interest in the breed, the better are the interests served, whether of the country generally or of the owners of the stock.

The value of a record of pedigrees becomes of course more obvious as the number of herds and animals increases; and we are glad to hear that Mr. STRAFFORD is preparing a new volume of the "Herd Book" for publication. He is receiving pedigrees from all quarters;—from H. R. H. Prince ALBERT, and from many a tenant farmer, as well as from the great breeders, Lords BERNERS, HILL, and FEVERSHAM, Sir C. KNIGHTLEY, Messrs. AMBLER, COMBE, CRUICKSHANKS, FAWKES, TANQUERAY, TOWNELEY, TORR, and JONAS WEBB, and many other well-known names. No one is better qualified to receive and classify and conduct a publication of this kind, for no one probably in the country knows so thoroughly the herds and individuals of the short-horn blood. It is out of the knowledge of the editor that the public confidence in this publication has arisen. And Mr. STRAFFORD's acquaintance with his subject has been tested long enough to make one sure that the new volume will be a full and truthful record of the principal additions to the breed since the appearance of the last.

THE Report of the Highland Society to the Board of Trade on the AGRICULTURAL STATISTICS OF SCOTLAND for the year 1854, has at length been published. Mr. HALL MAXWELL reports most favourably of the success of the effort which has during the past year been made, and does full justice to the cordiality and activity with which he has been almost universally assisted.

"The Scotch farmers, as a body, at once recognised the importance and utility of the measure, and endeavoured to support and forward it by readily and faithfully affording the information required from them; and it is due to the small minority by whom the policy of the inquiry may have been questioned, or its objects misapprehended, to state, that they, in general, waived their objections, and abstained from interfering with the success of a measure approved of by the bulk of their fellow farmers. The exceptional instances of positive opposition and refusal have been extremely rare, and in but few of these have I experienced any difficulty in obtaining authentic information from other sources; the schedules still unreturned or unaccounted for do not amount to one-fifth of one per cent of the number issued."

We give below the main facts, namely, first, the extent in crops within the 32 counties of Scotland; second, the number of stock; and lastly, the gross produce of the country.

1. *Acreage of the several Crops in Scotland.*—Wheat, 168,216; Barley, 207,507; Oats, 932,994; Rye, 3809; Bere or Bigg, 18,118; Beans, 37,702; Peas, 6169¼; Vetches, 13,442½; Turnips, 433,915¾; Potatoes, 143,032¼; Mangold, 1946¾; Carrots, 1218; Cabbage, 1395½; Flax, 6670½; Turnip seed, 1429½; Bare fallow, 26,128¾; Grass in the rotation of the farm, 1,427,790½; Permanent pasture, 1,207,101¼; Irrigated meadows, 69,256¼; Sheep walks, 6,530,842¾; Houses, roads, fences, &c., 130,538¾; Waste, 830,730¼; Woods, 413,391; Total, 12,613,345½. [This is not the whole extent, chiefly owing to the fact that highland and stock farmers do not know the extent of their occupations.]

2. *Number of Stock.*—Horses, 156,595; Milk cows, 292,365; Other cattle, 438,334; Calves, 205,172; Ewes, gimmers, and ewe hogs, 3,360,289; Tups, wethers, and wether hogs, 1,426,946; Swine, 163,683.

3. *Gross Produce of Scotland, in bushels.*—Wheat, 4,848,499; Barley, 7,639,601; Oats, 33,854,319; Bere or Bigg, 537,250; Beans, 1,080,921; Turnips, 6,372,189 tons; Potatoes, 523,383 tons.

The average produce per acre in each county, and in each district of each county, is stated in detail; and a reference is made to the produce of the year relatively to the average produce of past years, to which we shall have further opportunities of alluding. We heartily congratulate Mr. HALL MAXWELL on the completion of his arduous labours. They have resulted in a thorough pioneering of the route for further exploration and accomplishment, and this, with the independent and undoubted value of the results obtained, is of the greatest possible advantage to the success of the effort that will be made to obtain annual returns at a much earlier period than the month of February of the agricultural produce of the country.

STATISTICS OF CATTLE FEEDING.

(*Continued from p.* 75.)

I NOW proceed to describe the performances of my 15 milch cows on hand, in December, 1854, of which I have already supplied some particulars.—Nos. 1, 2, and 12, bought as strippers, giving 7 to 8 quarts per day. No. 1 bought recently.

No. 2, July 11th, 9 cwt. 2 qr.; milk, 8 qts per day. Nov. 28th, 11 cwt. 1 qr.; milk, 8 qts per day; gain in 20 weeks 196 lbs.

No. 12, Sep. 5th, 8 cwt.; milk, 8 qts per day. Nov. 28th, 8 cwts 3 qr. 20 lb; milk, 6 qts per day; gain in 12 weeks 104 lbs.

Nos. 7, 11, and 15 are in calf, in different stages. Of these I may state that they improve perceptibly in condition and consequently in value.

Nos. 4, 5, and 13 have recently calved, with an average yield of milk of about 15 qts. per day; they are fully maintaining their weight. Nos. 3, 6, 8, 9, 10 and 14 have been in hand since calving. From the length of time they have been under treatment, 33 weeks on the average, their performance appears to merit particular attention, as showing more clearly the effects of their food. The three weighed on the 21st of February had calved six to eight weeks; those weighed on the 23d of May, four to six weeks previously to their first weighing:—

	Feb.		Milk. quarts.	Nov.		Milk. quarts.	Time on hand.	Gain.

								6)936

Gain for 33½ weeks, being 4⅔ lbs. per week each, 156 lbs.

It will be observed that during the first half of the time the cows would about maintain their weight, and that the gain will have accrued during the latter half, being nearly 9½ lbs. per week, with an average yield of about eight qts. per day each. Their yield of milk will have probably averaged 10 qts. per day each throughout; it is, however, quite safe to estimate it at nine qts. per day. The whole six are free from calf, in which state

they hold better to their yield of milk. They were bought near calving, and their calves sold within a few days of being calved for 30*s.* each; I allow 10*s.* for the keep of the cow, and reckon 20*s.* towards reduction of cost. It will be seen that during the 33½ weeks they have averaged a gain of 156 lbs. each; this I apportion wholly to useful material, making at 6*d.* per lb. 3*l.* 18*s.* On comparing their value at present, I find them worth more by 2*l.* to 3*l.* each than their first cost. Up to the early part of May they were in stall, and on winter food; during the summer months on Grass, being housed at night, with two feeds of steamed food per day. During October they were again kept wholly in stall, and treated as previously described. Their progress throughout has been steady, and taking the yield of milk and gain of weight into consideration, the feeding in stall and on winter food has not been to comparative disadvantage. Of the quality I can only speak as regards the yield of cream and butter, which I have tested frequently, and with a result nearly uniform, being from 16 quarts of milk 26 oz. of butter. On one occasion, in Dec. 1854, when on stall food, the yield of butter reached fully 27 oz. from 16 quarts. This uniformity in the yield of butter can only be expected from attention to the temperature of the dairy. I may at some time seek occasion to explain, on the invitation of your intelligent Clitheroe correspondent, my mode of equalising this by the application of hot water in winter, and cold in summer.

The produce of the dairy is disposed of in new milk at 2*d.* per quart, or in butter at varying prices, and old milk at 1*d.* per quart. For some time the latter, owing to the higher range of butter, has been the more profitable. The pecuniary results will appear to be :—

9 quarts per day new milk, at 2*d.* per quart ... per week	10*s.*	6*d.*
Gain in value, 2*l.* 10*s.* each, during 33½ weeks	1	6
Yield of excrement, 84 lbs. per day, 5¼ cwt. per week ...	2	2
	14	2

To ascertain the quantity of excrement, the yield from eight cattle, of solid and liquid during 12 days, was found to weigh 71 cwt., being the contents of the tank under the tails of the animals, into which the excrement passes through open boards. To ascertain its value I have referred to several analyses made by Prof. Way of the manure from my cattle. I assume the per centage of nitrogen at 50—60 ammonia per cent., or for 112 lbs. 67.

Its value at 7*d.* per lb. will be ... ... per cwt.	0*s.*	4½*d.*
Phosphate of lime 64 per cwt.	0	0½
per cwt.	0	5

As the same food in quantity and quality is found adequate to supply the large yield of 14 quarts of milk rich in nitrogenous casein compounds, and also a phosphate of lime, the assumed per centage of these and the value of them in this excrement will be moderate, and probably below what is its real content. It is free from admixture of straw and other foreign material, and undergoes little or no fermentation previous to its being applied.

Your readers will find a description of food in the *Agricultural Gazette*, Sept. 30th and Oct. 7th. It consists of—

		Per week.
5 lbs. of Rape cake and 2 lbs. of Bean-meal per day,		2*s.* 7½*d.*
½ lb. of Bean-meal, or 7 lbs. per week		0 3½
12 lb. meadow hay, at 3*s.* 6*d.* p. cwt., 84 lb. p. week,	2*s.* 7½*d.*	2 11
10 lb. Bean & Oat straw & shells of Oats, 70 lb. ...	1 0	
32 lbs. of food, 10*s.* per ton 224 lb.	1 0	
		4 7½
Attendance, 1*s.*; coals, 1½*d.*; cooking, 1½*d.*		1 3
		8 9½

The green crops I use consist of Cabbages till December, Kohl Rabi till February, and after this Mangold. I have not ascertained the produce per acre of the Cabbages by actual weighing, and therefore do not venture an estimate. That it will doubtless be larger than any other I cultivate, may be inferred when I state that on weighing some of the individual plants I found them of 30 lbs. and 35 lbs. each, and such were by no means rare. My Kohl Rabi (Cabbage Turnip) is likewise productive. I have ascertained, by actual weighing, a produce of 34 tons per acre, including the fresh green tops or leaves, which are eaten with relish, and have not the laxative property of Turnip-tops. In cultivating Cabbages and Kohl Rabi I introduce between each row one of early Potatoes, which are taken up in time to allow their neighbours room to expand their foliage to the full. Each crop, Potatoes, Cabbage, or Kohl Rabi, I reckon as occupying the half of an acre; the early Potatoes afford satisfactory remuneration for their half. The manure applied is the mixed liquid and solid excrement of cattle, fed on the produce of my farm—that for next season has already been ploughed in near a foot deep; taken from under the animals in all its freshness, and without exposure to the atmosphere, except on its removal, it will remain undisturbed until the cultivator and harrow are used for preparing the ground for the reception of the plants and tubers. The Cabbages and Kohl Rabi would doubtless be a profitable substitute for the hay, yet I cannot use them to a great extent, without detriment to the flavour of the milk and butter.

(To be concluded in our next.)

Home Correspondence.

Rotation of Crops.—This is a subject which from time immemorial has claimed the attention of farmers; it involves that of manure also, and renders it the more complicated. There is one leading point connected with both subjects, which appears to have been overlooked; and to this I hope now to recal attention. About 30 years have elapsed since the late eminent philosopher De Candolle promulgated an hypothesis "On the fecal or radical excretion of plants," by which much light was thrown upon the inquiry concerning the necessity of rotations in cropping. In the spring of 1854, at a meeting of the Croydon Farmers' Club, it was stated that red Clover could not be generally re-cropped on the same land more frequently than about once in seven or eight years! I was thereby led to undertake a close and protracted series of experiments with several varieties of the trifolium family, the common red, the white or Dutch Clover, and some of the smaller yellow Trefoils. Plants were carefully lifted, the roots were washed, and then inserted in phials of very pure filtered rain, or distilled water. After standing and growing in such pure water for several days, I found that, in every case, matters had been excreted by the roots of each variety, which were detected, more or less palpably, and proved the presence of carbonic and sulphuric acids, of chlorine, potash, and ammonia. Now, although we may not be able to prove by such facts that plants do in reality poison the land by fecal exudation, so far as each individual is concerned, or conversely, that they may enrich or manure it for others of a different temperament; yet, as exudations do take place without question or doubt, we ought to keep our minds open, and our judgment free from the prejudice of empirical routine. I claim, therefore, the reconsideration of De Candolle's theory, and venture to assert that it is not solely by exhausting the soil that certain plants fail if planted on the same ground year after year; for were this the case manuring would renovate the ground, but it fails to do so, and thus, if Peas or Wheat be sown repeatedly, the farmer may manure to whatever extent he shall please, yet his crops will dwindle and become poorer. Soils differ everywhere, even in the same field or garden; and therefore each farmer ought to become his own chemist. In the Isle of Thanet, that rich granary of London, I had proof in 1820, that if Peas were frequently replanted the ground became poisoned or "overpead." The seed might germinate, but the plants soon became yellow, or (locally) "foxed," and yielded nothing of a crop. *J. T., Croydon, Feb.* 6.

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

MONTHLY COUNCIL, *Feb.* 7.—Mr. MILES, M.P., president, in the chair.

FINANCES.—Mr. Raymond Barker, chairman of the Finance Committee, reported the current cash-balance in the hands of the bankers, at the end of the previous month, as 3818*l.* He informed the Council, that this balance included a subscription of 1400*l.* from the authorities of Carlisle, towards the expenses of the ensuing country meeting of the Society to be held in that city. He laid on the table, for the information of the members, the various quarterly statements of account connected with the different financial departments of the Society.

IMPLEMENTS AND MACHINERY.—Col. Challoner, chairman of the Implement Committee, submitted to the Council the report of that committee; which had reference principally to the following points :—

1. The recommendation of implement and machinery prizes for the Carlisle Meeting, similar to those offered at Lincoln, with the following alterations :—
   (1.) That the deep ploughing should be required at a depth of 9 instead of 10 inches.
   (2.) That the prize for the best liquid-manure or water-drill should be raised from 5*l.* to 10*l.*
   (3.) That the prize for the best reaper should be raised from 20*l.* to 30*l.*; and that an additional prize of 20*l.* should be offered for the second best reaper.
   (4.) That the horse-power for the fixed steam-engines should be reduced from ten to eight-horse power.
   (5.) That instead of the former prize of 5*l.* for the best corn-dressing machine, a prize of the same amount be offered for the best machine to "dress corn for market after it has been screened or riddled."
2. The recommendation of the following new conditions affecting the construction and trial of implements :—
   (1.) That in adjudicating on the award of the prize of 200*l.* at the Carlisle Meeting for the "steam cultivator that shall in the most efficient manner turn the soil, and be an economical substitute for the plough or the spade," the attention of the Judges be particularly called to these terms in which this prize is offered.
   (2.) That in adjudicating on the award of the prizes for reapers, the attention of the Judges be particularly called to the best mode of delivery.
   (3.) That in portable steam-engines worked on the expansive principle, the condition under which the steam is cut off shall not restrict the makers, as last year, to "a lap on the common slide," but simply to the employment of "no complicated means" for effecting that object.
   (4.) That the greatest attention be paid by the Mechanical Judges to the plans and specifications of the boiler and fittings proposed to be supplied by the winners of the fixed steam-engine prizes to their respective customers.
   (5.) That, in the case of the threshing-machines, the greatest attention be paid by the Judges to the state of the Barley after it has been threshed (as to injury more or less, or otherwise, of the grain, after such operation).
3. The recommendation of the following special objects:
   (1.) That, in future reports of the exhibition and trial of implements and machinery at the Country Meetings, published annually in the Journal, it be suggested to the Journal committee, that the drawings and specifications should be given of the boilers proposed for the two prize fixed steam-engines; in order that the purchasers of those engines may be enabled to ascertain that the implement maker supplies to him a proper boiler, similar to the one exhibited in his original drawings, and which the judges had included in their award, as an essential condition affecting the completeness and general value of the engine.
   (2.) The recommendation that the Council should place at the disposal of the Implement Committee the sum of 115*l.* for the purchase (at prime cost) of the Dynamometer for threshing machines, invented by Mr. Amos, and employed by him with so much success at the Lincoln Meeting; and a sum not exceeding 20*l.* for rendering the present three friction-breaks of the Society, for testing steam-engines, self-acting and independent of special calculation:—the adoption of these new arrangements not only saving the expense of a breaks-man, but affecting a saving of one day's time in the trials.

The Council unanimously confirmed and adopted this report.

CARLISLE MEETING.—Mr. Milward, as Chairman of the day of the General Carlisle Committee, submitted to the Council the report of that Committee, which had reference principally to the following points :—

1. The election of Mr. Fisher Hobbs, as Vice-Chairman of the Committee.
2. The settlement of the date for the Meeting, as the week commencing Monday, the 23d of July.
3. The suggestion that a pavilion should be constructed at Carlisle for the purpose of accommodating 800 guests at dinner, at four o'clock on the Thursday of the week of meeting.
4. The request to Mr. Brandreth Gibbs, that as Honorary Director of the Show, he would prepare as usual the preliminary plans for the respective show-yards at Carlisle.
5. The request to the Stewards of Implements that they would purchase the requisite amount of Barley and Wheat in the straw, for the purposes of the trial of agricultural machinery.
6. The adoption of the same schedule of Prizes and conditions of show, for Farm Poultry, at Carlisle, as at Lincoln last year.
7. The acceptance, with thanks, of the following Special Prizes, to be competed for at the Carlisle Meeting under the general regulations of the Society's Show.
   (1.) From the Carlisle Local Committee: 75*l.* for Cheviot Sheep, and 80*l.* for horses.
   (2.) From George Head Head, Esq.: 100*l.* for Galloway Cattle.
   (3.) From Robert Ferguson, Esq., Mayor of Carlisle: two pieces of plate, value 40*l.*, for the best thorough-bred stallion, and of 30*l.* for the best coaching stallion.

The Council confirmed and adopted this report.

STEWARD OF CATTLE-YARD.—On the motion of Mr. Simpson, seconded by Mr. Barnett, Sir Stafford Northcote, Bart., was appointed one of the Stewards of the Cattle-yard at the Country Meetings of the Society.

FOREMAN OF FIELD.—On the motion of Mr. Thompson, seconded by Mr. Hoskyns, power was given to the Implement Stewards, at the Country Meetings, to elect a Foreman of the Field, at such a rate of payment for his services as the Council may decide.

Important communications from the Earl of Clarendon, on the discovery of supplies of guano, were referred to the consideration of the President.—The annual report of the Royal Veterinary College was referred, with various other papers, to the weekly meetings of the Council, at which all members of the Society have the privilege of being present.

The Council adjourned to Wednesday, the 14th Feb., at 12 o'clock.

Farmers' Clubs.

LONDON.—A crowded meeting of the members of this Club was held on Monday last at the York Hotel, New Bridge Street, Blackfriars, for the purpose of taking into consideration the following important subject proposed by Mr. Mechi, of Tiptree Hall, Essex :—"*To what Extent can Town Sewage be Profitably applied to the Purposes of Agriculture.*" Mr. Shearer, of Hampshire, presided. The chairman, in introducing the business of the meeting, stated that they had met together that evening for the purpose of considering a subject which was of the utmost importance to the agriculturist. The committee had appointed him to take the chair, not because he was a distinguished practical farmer, but because they considered that he might be of use in promoting the interest of the Club, and of this he was sure, that after remembering the many pleasant evenings he had spent there, and the amount of practical knowledge he had derived, they could command him at any time (hear). This Club was of the greatest value to all connected with agriculture, and he therefore trusted all present would do their utmost to support and extend its usefulness. The subject which Mr. Mechi was about to bring under their consideration was fraught with the greatest interest, not only to farmers but to every class in the community, for by the introduction of railways, by the extension of common roads, and the large space occupied by new buildings, 10,000 miles of land in this country had been lost to them. It therefore behoved every class to do all they could to promote agriculture. With regard to town sewage it was a very important question, and one upon which he was certain the Club would be glad to receive any information In conclusion the chairman stated that he did not think the Club could receive information of more importance, or from a better source, than from Mr. Mechi.

Mr. MECHI, who, on rising, was received with cheers, spoke as follows :—One hundred years hence, which is not long in the history of a country, our successors will scarcely believe that a nation wanting annually many millions of quarters of grain to fill up its own inadequate production of food, should waste the only means by which such deficiency might be made good. I mean the productions of the land when they have fulfilled their office of nutrition to man and beast. Every one now at all conversant with the theory of modern agricultural chemistry must know that our agricultural produce loses little by such a process, and that the bulk of its elements are returned to us in the shape of excretæ if we take the trouble to collect them. I am aware that the practicability of doing so has been questioned; but I purpose this evening to show that there is no difficulty in the matter, except what exist

in the brain of man. The same power that brings your water into London will take it out again; for according to Prof. Way and other chemists, 2,500,000 inhabitants will only add 3769 tons in solid and fluids to the quantity of water.

If agriculturists studied attentively Professor Way's able paper on Town Sewage (see Royal Agricultural Society's Journal, vol. 15, part 1, page 1351), it would teach them a great and profitable lesson. They would learn that of all the manure made by human beings (and I have no doubt by animals) 12 parts out of 13 in weight escape as urine, only 1-13th part being solid! Well may farmers love the sheep-fold, and well may they deplore yard feeding, where the rains from the untroughed roofs may, in too many instances, thus take away nearly all their manure. Mr. Way, with his usual care and exactness, has found that, taking the average of men, women, and children, each individual of the population will in the course of 24 hours contribute to the sewage of a town one quarter of a pound of solid and three pounds of liquid excrement. A knowledge of these facts shows us how trivial is the question of solid manure, for at a quarter of a pound each daily the total solid manure of 2,500,000 people in this metropolis will only weigh 279 tons.

According to Mr. Way, the excrement of each person is diluted with or distributed through 20 gallons or 1400 times its own weight of water. It must appear singular to a disinterested observer that whilst farmers seek eagerly after every new manure, and are subjected to much imposition in such purchases, they appear to be apathetic on the question of town sewage.

I think much of this neglect must arise from the fact of its being in a fluid state, for to the distance of 100 miles from London the solid manure of the metropolis is purchased by agriculturists at an expense of from 4*s.* 6*d.* to 6*s.* per ton, one-half of this cost being, of course, for freightage, and then another 30 to 50 per cent. must be added for cartage to the fields, with a further charge for turning over, spreading, ploughing in, &c. Omitting the sanitary consideration, there can be no class so deeply interested in the question of town sewage as the British farmer. Those sewers carry away to our rivers all the products which he has at so much care and cost produced for the food of the people. To repair the exhaustion caused by these supplies, he rushes to Peru for birds dung, at an expense of some millions, whilst the very grave-yards of foreign nations are taxed to supply bones for his Turnips. The rapid increase of water closets and new sewers, with a more abundant water supply, are daily lessening the supply of human excreta in a solid form, diminishing, in fact, *pro tanto*, the ordinary channel of supply, so that shortly we may expect that only the stable manure and ashes of London will be availble for agricultural purposes, whilst the weekly supply of 6000 or 7000 bullocks, 40,000 sheep, and all the other vast solid and fluid consumeables of the metropolis, from tea to turtle, will be floating down the sewers unheeded and unsolicited.

This cruel neglect can only arise from a disbelief of the value of such manure, or from a doubt of the possibility of applying it economically. I purpose therefore this evening to go into statistical details with a view to ventilate the question, and to prove how easily such an operation may be successfully carried out with individual and general benefits. Water alone is manure: who can doubt this? Look to the costly water meadows in various parts of the kingdom, and what farmer who has a water meadow does not appreciate its great value to him, as producing early, late, and most abundant vegetation. My own experience with two miles of pipes on my farm of 170 acres has proved that fluid applications of manure are far the most profitable, and that their influence is quite as important and advantageous to cereal as to other crops. In proof of this I have threshed some fields of Wheat, producing 6 quarters per imperial acre; Oats, 13 quarters; and Barley, 8 quarters, which latter is 1 quarter more than I estimated in my balance sheet. Now such productions as these on a naturally wretched soil prove more than volumes of argument, and I have no hesitation in saying that had my neighbours to pay 2*l.* per acre annually in interest for improvements over and above their present rent to obtain similar results, they would be considerable gainers. If it answer my purpose to lay down pipes, erect an engine, make tanks, erect pumps, and so on, for the mere purpose of applying the manure made on my farm in a fluid state with a large supply of water from my spring, surely it must equally and more certainly pay a farmer to receive back his corn, bullocks, sheep, and other productions after they are done with at a very much smaller cost; for their very essence will return to him accompanied by all the good things that metropolitan luxury can command from every foreign part. If we go into a statistical inquiry of the weekly supply of London in tea, coffee, and sugar; wine, spirits, and beer; fish, flesh, and fowl (foreign and British); the tons of soap, and the thousand and one refuses of our manufacturers, gas-works, &c., one becomes amazed at the fructifying power involved in such a consideration. The alkaline and granited solutions of our London pavement by trituration and abrasion, the smuts from our smoke, have all a considerable value.

The mere wear and tear of shoe-leather has its value, as it grinds down the pavement into hollows. I apprehend that the daily cost of feeding each individual in this metropolis, taking the average of rich and poor, young and old, would not be less than 10*d.* per day, or 37½ millions sterling per annum. Now in parts of Lincolnshire it is the custom to value the manure at half the cost of the oil-cake consumed. On this principle, which appears to be a sound one, the agricultural value of the manure from this 37½ millions of food ought to be something very considerable, to say nothing of the food consumed by the animals of the metropolis. The rubbing, washing, and agitating which the solid excrement receives in passing through miles of tortuous sewers, cause it to be dissolved and pass away in a fluid state, which we may any day prove by an examination of the sewers' mouths at low water. I think farmers cannot be aware that all the solid and liquid manure of men and animals is liquifiable by solution or suspension, and can be applied in a shower, sinking deeply into the subsoil of drained land. Perhaps I may be here permitted to explain why I consider this mode of application far superior to the solid form. If you make a transverse cut or opening in the soil, you will find that the British agricultural pie-crust is only 5 to 8 inches thick. The slips and railway cuttings plainly reveal this humiliating fact. Below this thin crust we see a primitive soil, bearing most unmistakeable evidence of antiquity and unalterability. The dark shades of the cultivated and manured surface have not been communicated to the pale subsoil; and we have evident proof that solid manure ploughed in, in the ordinary way, exercises little influence on the subsoil. Nor can this be wondered at, when the plough sole has been polishing and solidifying the floor at the same depth for the last few centuries. Now, when I apply liquified manure (which means all the solid and liquid excrements of the farm animals mixed with water), it soaks deeply into the subsoil to the depth of the drains, which I have seen, on the very strongest clays, discharging the liquified manure at a depth of 4 and 5 feet. Here, then, is the secret of my great crops on a miserable soil. The manure vitalises, warms, and chemically changes the miserable subsoil; the roots of the growing crops know this, and send down their fibres or mouths to appropriate and elaborate the subterranean treasures now for the first time placed at their disposal in an available condition. I could show you 26 loads of rich oilcake bullock pudding, or manure; I would mix it with water, apply it in a shower, and you should search the surface in vain for any proof of its whereabout. It has gone down to do its work. I will not drag you through all the details of the *modus operandi* of this method of manuring; you may see it all any day you choose on my farm, or on any of those of others who are practising the same process. What I want you to believe is, that town sewage is liquid guano, applicable to every soil and every crop, and worthy of your utmost attention. It is true that undrained land, requiring drainage, such as heavy clays and spring soil, must undergo that operation before they can derive the benefit of such an application; but there are extensive tracts of chalks, sands, and hot gravels, almost praying to be fertilised by the sewage of our towns.

Although I apply my liquified manure on the surface, I am quite convinced that during the summer season and amongst the growing crops, it would be far more advantageous to apply it subterraneously, as effected by Mr. Wilkins last year at Wokingham, and this year at Reading. By this means the openness and tillage of the surface is undisturbed; the rays of heat and light are employed in warming the earth, and evaporating from the leaves, the subterranean supply of fluids which the plants absorb by their roots, and which arise to them by capillarity. The question is a large one, involving considerations of cost, but most certainly production is vastly increased and stimulated by the new method.

One important reason for the superiority of liquified over solid manures, is, that water is the great arrester and conveyance of ammonia, that invisible and truant spirit which is ever escaping unseen from reeking dung-heaps. It is this ammonia which dissolves the silica of the soil, and makes the kernel of our Wheat, and the lean of our flesh; and it is for this ammonia that we so affectionately prize unwashed Peruvian guano, or bird's dung. When you have learned to apply fluid manure to the soil, you will find your crops yield as much as they do after the sheepfold, and you will get corn as well as straw, that is, if you do not sow too much seed.

You must give up all hopes of obtaining town sewage in a solid form, for Professor Way's able paper (which every agriculturist should read), in the Royal Agricultural Society's Journal, and other evidences are conclusive on that point. I understand upon good authority that the commissioners of sewers have decided that a main tunnel on the south side of the Thames shall receive the sewage of 1,200,000 people, convey it to Plumstead marshes, whence it will be pumped in a reservoir, and at high tide pass away with the flood water of the Thames, that is if British agriculture is insane enough to permit such a cruel waste.

The question will arise who is to undertake this? Now, in railroad undertakings we find landed proprietors and other interested parties joining with town capitalists, and affording them every inducement and opportunity to open up a country with general benefit. Let the same be done with sewage. Depend upon it, without this co-operation no town capitalists will be so miscalculating as to place their capital at the mercy of local prejudice or neglect. It therefore remains with agriculture itself to determine whether this interesting question shall receive its proper solution. But supposing that the new company has laid down its main line of pipes for country distribution, where will you find the 3*l.* per acre for the net-work of iron-pipes, &c. requisite on every farm. It appears to me that where the capital is required it may be readily obtained from the Lands Improvement Company or Land Drainage Company, and that the annual charge which would liquidate principal and interest in a few years would leave a large margin of advantage for both landlord and tenant. To those who desire to see the mode of applying town sewage may be quoted the instance of G. H. Walker, Esq., who takes the town of Rugby, &c.; — Worsley, Esq., of Rusholme Park, near Manchester, who uses the sewage of a neighbouring district. In both these cases, steam-power is applied, although I think Mr. Walker's pipes of 3-inch diameter are hardly large enough for the diameter of his pumps.

Of course if the London sewage is used, I apprehend it would be pumped to elevated district reservoirs, whence it would flow from main pipes connected with smaller ones on the various farms, so that they would be always charged with a sufficient pressure to cause a jet; this would render unnecessary any steam engine or tank on the farm. A register of quantity like a gas meter would enable the company to make their periodical charge. I annex the following statistical account with which I have been favoured by Edwin Chadwick, Esq., C.B., our greatest authority in such matters:—

"The gross daily quantity of water pumped into the metropolis was in the year 1850, 44 million gallons. It may have been increased somewhat since that time, but I should expect that it would still be within 50 million gallons per diem. I proved at that time that about three-fifths of the quantity pumped in was wasted on account of the intermittent methods of distribution. The actual quantity consumed for domestic purposes, or that you could estimate for sewage as containing house refuse, or house manure in suspension or solution at times when there is no rain applicable as manure, would not be more than 20 million gallons per diem. I say house manure because rain and storm waters bring as surface washings dung from the streets, and soot and birds' dung from the roof of houses. You may judge of the daily quantity visibly by the fact, that 45 million gallons would be delivered in 24 hours by a brook 9 feet wide and 3 feet deep, running at the rate of 3 feet per second, or a little more than two miles per hour, and three sewers of 3 feet diameter, and of a proper fall will suffice for the removal (for distribution) of the same volume of refuse or soil water. The total weight of this annual supply of water is nearly 72 millions of tons. The daily cost of raising the whole supply by engine-power 100 feet high (for distribution) would be about 25*l.*, or 9000*l.* per annum. Supposing the supply were equally distributed, *i e.*, the 44 millions, it would be about 50 pails full for each house, and would weigh about 13 cwt."

Those who doubt the cheapness at which water can be raised may be assured by visiting the Croydon Water-works, where 650,000 gallons are forced to a mile distant, and elevated 150 feet, at a cost of 13½ cwt. of dust coal per diem of 24 hours. With regard to the mode of conveyance, it appears to me that our railway lines might be availed of to lay down lines of pipes, but of course all such questions would be easily arranged by competent engineering authorities. Perhaps it will be as well to state, that 15 yards of 3-inch iron pipe per acre, will be all that is required, or about 5½ cwt. of iron per acre; this is the quantity on my farm, I have 170 acres piped. Amongst numerous papers that I have written on this subject, I beg to refer to one under the head Sewage, in "Blackie's Cyclopædia of Agriculture." The value of London sewage has been variously estimated; but Professor Way, in his usual careful way, has calculated it by its ammonia at two millions sterling. He has made no valuation of the water alone; I apprehend that 50 millions of gallons daily, or 224,000 tons would have, even when unmixed with manure, a considerable irrigating value.

In order to ascertain whether this application of sewage will pay the farmer a profit, and leave a sufficient interest for the capital invested by a company, let us calculate 72 million tons of sewage at one penny per ton, would be 300,000*l.* Now, take the pumping or raising this quantity at the exaggerated sum of 50,000*l.* annually, there would remain 250,000*l.* as interest on capital invested, which, at six per cent., would be also the exaggerated sum of 4,000,000*l.* sterling.

I have assumed the sum of one penny per ton as representing that which would leave the farmer and landlord a very large profit on their pipe investment. I can confirm this by my own practical experience. But it must be obvious to any one who reasons that as 100 tons of water per acre represents a rain fall of 24 hours, this alone, without the saturation of manure, must be worth one penny per ton, or 8*s.* 4*d.* per acre, and indeed in dry weather for Grass crops very much more. As to the quantity required per acre, Mr. Telfer, of Canning Park, Ayr, tells me that he applies 500 tons of water per Scotch acre at five dressings, to his Italian Rye-Grass, with five cwt. of Guano at each dressing, making a total annual application of 25 cwt. of Guano per Scotch acre (one-fourth larger than the English acre). This is in a naturally moist climate, therefore we may estimate the water-absorbing power of the barren sandy wastes in the neighbourhood of the metropolis far more considerable. That those wastes would be rendered highly productive after the application of town sewage cannot be doubted.

The experiments of Mr. Wilkins, who grew two crops of Hemp and Flax in one season at Wokingham last year, settle the question. Now, if you apply 500 tons per acre you will only require 152,000 acres to absorb your 76 millions of tons. As 640 acres are a square mile, you would at that rate require 237 square miles, or a square area whose diameter would be about 15 miles. I have a strong conviction that a very much larger quantity of sewage, say 1000 tons

per acre, at least may be profitably applied to our sandy, gravelly, and chalky wastes. This would afford a great economy in distance and expense. On the Edinburgh meadows as much as 6000 tons per Scotch acre are applied; but that appears to me hardly a necessary quantity. Still, if such large quantities could be applied to so limited an area, it is clear that instead of one penny per ton the cost need not much exceed one farthing. Six thousand tons at one farthing per ton would be 6*l.* 5*s.* per acre. This would pay; for the average letting of the Edinburgh meadows to the cow-keepers was, I am informed, last year 21*l.* per acre—a pretty good evidence of the beneficial effects of town sewage on waste lands that were a few years since worthless and barren.

I apprehend no one will doubt the economy of transmission of fluids by tubes, seeing that by road carriage the charge of carting near the metropolis would be at least 8*d.* per ton per mile. There is no fear of our being overwhelmed with cheap hay or superabundant milk by this process, for our metropolitan wants become annually more and more gigantic, but I do know, from extended and minute observation, that the infants and juveniles of this metropolis would present a very different muscular and general development if this scheme were carried out, for now the wretched wrecks of noble short-horned cows, observable on every green patch around the metropolis, speak volumes of the thin sky-blue which is vainly expected by fond parents to form the bone and flesh of their dear children. Their pallid faces and feeble limbs present infallible evidence of defective nutrition. In conclusion I do hope that this club of practical agriculturists will, by their resolution this evening, stamp their opinion of the necessity for this great national economy. (Hear, hear, and cheers.)

Mr. Cuthbert Johnson admitted this was a most important and opportune subject, but one fraught with difficulty. The great difficulty was not in persuading the farmers of England of the great value of sewage manure, but was to be found in the fact that they had never been able to avail themselves of it. (Hear.) It was also forgotten in any experiments that had hitherto taken place that the sewage of a town was of the greatest value the further it could be removed from it. A new light has now dawned upon the subject through the great efforts of Mr. Chadwick, who has ably shown that the further every form of sewage was removed from the habitations of the people the better. One result of that gentleman's labours was that the towns have resolved to make an effort, and the Metropolitan Commission of Sewers, of which he was a member, had last week decided to form a large sewer, commencing near Lambeth, which, after traversing Southwark, Rotherhithe, Greenwich, and Woolwich, should finally empty itself at Plumstead, where it would be pumped into a large reservoir capable of containing the whole sewage of London for 24 hours; and at the first ebb of the tide the sluice gates were to be opened, so that this matter, which was of the greatest value to the English farmers, might be carried out to sea. He hinted, however, that when that plan was finished, some men would be found who would come forward and take the subject up, so that the sewage of London might be distributed over the thirsty grounds of the county of Kent. On the north side of the river also a great sewer was to be made, which was to empty itself at Barking Creek, so that on both sides the sewage of London would be made available for agriculturists. After quoting the opinion of Professor Way on the subject of the sewage of towns, and giving the results of the washings of the streets of London, all of which contained potash, and would be washed into the new sewers, Mr. Johnson proceeded to state that when the matters in the sewers were collected together in a solid form, the farmers used it, and he felt certain that when the sewage of London was collected together in the way proposed by the commissioners that they would again avail themselves of it. With regard to his own experiments, he might state that they had been very satisfactory. He had had the soil analysed before the operations began, and had had it done since, and he intended in the course of a few days to publish the result. The grass which had been subjected to the action of liquid manure was an object of great attraction; and he had had no less than five full cuts from his, while his neighbours on the other side of the hedge, who had not used liquid manure, had only had one cut and a half. His neighbour's crop was ripe while, as he before stated, his were only cuts.

Mr. Woods, of Sussex, felt certain that if the sewage of towns could be obtained by the farmers at the prices named by Mr. Mechi, it would be used to the full extent. All questions of a sanitary form were quite beyond what they had met to consider. He was sure that farmers would avail themselves of the liquid manure if they could get it, but they could not, and they were therefore compelled to content themselves with the solid. He considered the finest mode of dressing the land was by liquid manure, and all that the farmers wanted was to get the plan proposed carried out. (Hear.) It was a question for capitalists, and if they would only favour the farmers with cheap liquid manure, they would in return favour them with cheap food.

Mr. B. Webster, of Worcester, knew that land irrigated with night soil had been rendered three times as valuable. Having stated many instances where liquid manure was used with the greatest advantage, he complained of it on the ground of nuisance, and concluded by remarking that if the town sewage were conveyed and used on the dry sands of Bagshot, they would make the finest market ground in the world, but he very much doubted whether it would be of any use on cold clay land.

Mr. Chadwick said that he had considered the subject under consideration for many years, and with regard to the nuisances complained of, knew it was caused by the mode of distribution. But that was also the case with the water meadows, which not only extended the rot in sheep, but where villages were near, caused typhus and other fevers largely to prevail. In Italy, the laws would not allow a water meadow within six miles of a city. The nuisance complained of in the use of liquid manure would be obviated more or less by the use of the jet, and the object would be more effectually promoted. In the case of the Edinburgh water meadows, the rent of the space would pay for putting down iron pipes. After stating various instances in which the nuisance had been obviated by the use of the jet, he went on to say that by its use the same area would be fertilised to five times the extent. He knew of an instance where no less than 90 tons of cabbage had been grown on a Scotch acre, and of no case of cereal crop where the increased produce had not been more than a quarter per acre. Mr. Pusey also bore testimony to the use of the liquid manure, when he stated that his crops had been largely increased by the use of the water-drill. The greatest difficulty that stood in the way of the adoption of the plan carried out by Mr. Mechi was that of who should pay, the landlord or the tenant. The value of liquid manure was four or five times greater than that of solid manure, for while the solid was lying on the land waiting for some chance shower to come and wash the goodness into the land the better portions were escaping altogether. In conclusion he stated that by the adoption of the plan proposed he considered there would be a grand future for agriculture (Cheers).

Mr. Moore stated that he had read a report printed in 1826, upon the water meadows of Scotland, in which it was stated that land which had previously been not worth 1*s.* per acre was then worth 50*s.*, and that only for Grass land. He thought it a lie, and had travelled 300 miles to see for himself, and was really astonished. In using solid manure there was great waste, but one of the beautiful features in the use of the liquid manure was that you could feed the crop whenever it required it. With regard to the objection that it would be of no use on cold clay land, he could state from his own experience that it would not if the land was not drained, but where that had been done no land was so productive as clay land when cultivated with liquid manure. In proof of this he could instance the case of Glasgow, where the sterile land of that neighbourhood had been rendered very productive.

Mr. Sidney should like to see some experiments carried on on a scale proportionate with the importance of the subject, for he was tired of hearing of the results that had been obtained from the sixth of an acre or from a wine glass (laughter).

Mr. Nesbitt had had his attention directed to the subject for the past 5 or 6 years, and had ascertained from experiments that you could only separate the sedimentary matter from the liquid. But it was of the greatest consequence that you should in taking the solid also obtain the soluble nitrates and other salts; but that had not as yet been done, and they were all allowed to flow into the river. He thought it was only by collecting the whole of the sewage matter into a reservoir, and pumping it out again, that the valuable parts, which the land most needed, could be obtained. He had no doubt that liquid manure was of the greatest use to green crops; but with regard to cereals, one drawback would be, that if the crop had a dressing and a wet season was afterwards to set in the whole of the crop would be laid. (Hear.) He trusted that some plan would be brought forward for saving the sewage of towns and for letting the farms have it, considering, as he did, that it was of the greatest utility to them. It was a disgrace to the country and the age in which we lived, that so much valuable fertilising matter should be allowed to escape to the sea. (Hear.)

After a few words from Mr. Acton, who said it was a curious thing that the Grass on Kennington Park, which was laid on land composed of nothing but night soil, should have turned yellow, and from the Chairman: Mr. Mechi said he wished to disabuse the minds of all present that liquid manure was not so good on clay as light soil. He was certain that those opinions would differ if parties were only to see it in use. He concluded by moving a resolution to the effect that the Club considers that sewage manure might be rendered of great value; and that, if it could be supplied at a cost sufficiently moderate to warrant its use, its introducer would be entitled to their gratitude.—Mr. Oakley seconded the motion, which was put and carried.

Mr. Smith, of Rye, proposed a vote of thanks to Mr. Mechi, which was carried by acclamation.

A vote of thanks to the Chairman concluded the proceedings, and the meeting broke up.

Miscellaneous.

Death of Mr. Bolden of Lancaster.—It is with regret that we announce the death of Mr. Bolden, well known in the agricultural world as the owner of a valuable herd of short-horns. Mr. Bolden was in his 70th year, and was one of the few breeders of short-horns contemporary with the Collings'—who possessed a herd at the time of the Ketton sale.

Calendar of Operations.

FEBRUARY.

WESTER ROSS, *Feb.* 5.—After a fortnight of severe frost we have again a return of fresh weather with easterly wind. The frost came very opportunely, as there was much manure to cart out, which could scarcely have been accomplished in the previous wet weather, but which was satisfactorily and speedily executed when the wettest field afforded as firm footing as the best made road. And there are many things which are apt to be overlooked or forgotten until the season comes round when the ground is locked up, and the ordinary cultivators laid aside. Fresh weather has returned in time to admit of field operations being gone on with as early as is desirable, and it is not at all likely that we will now have a protracted frost or snow. A pretty large breadth of Wheat has been already sown, and. weather permitting, a good deal more will yet be laid down. The price of Barley has this year been low compared with the price of Wheat or Oats, and the likelihood is that there will be a smaller breadth of Barley and a larger proportion of Wheat sown than last year. The price of Oats is generally higher comparatively in this county than that of any other kind of grain, and is just now as high as the London price of Oats. A large proportion of our soil is well adapted for growing Wheat, and a very large proportion of the county is under sheep, and as our population is still respectably numerous, and as Oatmeal forms their staple food, especially since the Potato failure, we find that we can scarcely grow Oats enough to supply our necessities, so there are annually imported a few cargoes of this commodity from the more exclusively Oat-growing counties. Potatoes are once again to be pretty largely planted, on the faith that should we have a visit from the disease this year at all, it will make its appearance in a mild and harmless form; and, besides, although the disease came so early last year as to leave us no Potatoes to ship, and very few fit to eat, yet what we have got are an admirable size for planting whole. The disastrous attacks of that disease with us hitherto have been biennial, and believing this to be now its established habit, we look for a respite this season. There is a great deal of distress and poverty throughout the highlands, caused by the Potato failure. The farmers' expenditure this year bids fair to be larger than usual. Artificial manures of all sorts are more costly; wages of man, woman, and child, are increasing, and, by and bye, the farmer is likely to find that even should present prices continue, they would not be greatly too much to meet the increasing outlay.

Notices to Correspondents.

GORSE: *B.* The Rev. W. D. Fox, of Delamere, Cheshire, has been kind enough to give us the following replies to your questions: The Gorse seed commonly sold in the seedsmen's shops is the only kind of seed. Some will sell it as "French Gorse," but I do not think it is the least different. Decidedly sow where it is to remain: but it would also be a very good plan to have a quantity sown in boxes—old Orange boxes answer very well, and can be got for almost nothing—in order to fill up vacancies in September. If your ground is very foul, I would altogether sow in beds, and transplant in September, and you can clean the land, but, of course, it is much more expensive, and if the land is clean it will grow much better sown where it is to remain. It is more readily sown by forming the land into drills, but the less they are raised the better. Manure will much improve it, but is not necessary. If the drills are 2 feet apart, a horse hoe can be freely used for cleansing between rows.

ITALIAN RYE-GRASS: *Parvus Agricola.* We shall publish a full statement on the subject on March 10.

HOT-WATER PIPES at wholesale prices, with Elbows, Syphons, Tee Pipes, and every requisite connection. Cast Iron Boilers, 55*s.* each. Improved Soot Doors and Furnace Doors. Builders' Castings of every description kept in Stock at — Mr. LYNCH WHITE'S, Old Barge Iron Wharf, Upper Ground Street (near Blackfriars Bridge), London.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

GLAZING WITH OR WITHOUT PUTTY.

E. DENCH, PATENT HOTHOUSE WORK'S, King's Road, Chelsea.—Printed Price Lists supplied on application.

SHEET GLASS (15 oz.) of good quality in 100 feet boxes.

10 in. by 8 in. and under	15*s.* per box.
11 in. by 9 in. to 22 in. by 14 in.	17*s.* „
Larger sizes to 28 in. by 18 in.	19*s.* „

Also similar sizes in 21 oz. Sheet at 24*s.* per box. Boxes charged 2*s.* each, and returnable at the same price, if delivered free. CRYSTAL WHITE GLASS, Crown and Sheet Glass in Crates, British and Patent Plate, &c. &c. White Lead, Oils, Turpentine, Colours, &c.—G. FARMILOE & SON, 118, St. John Street, West Smithfield.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in. ...	13*s.* 3*d.*	per 100 feet.
7 by 5 to 8 by 6	13 6	
8½ by 6½ to 10 by 8	14 0	
10½ by 8½ to 14½ by 10½	16 0	
17 by 10 to 18 by 12	18 0	

A great variety of sizes. Particulars had on application.

ORCHARD HOUSE SQUARES on Mr. RIVERS'S plan, to whom I have sold some thousands of feet.

Large Sheets for cutting up, in cases, at 2½*d.* and 3*d.* per foot.

HARTLEY'S IMPROVED ROUGH PLATE GLASS, Sheet, and Rough Plate, Tiles, Milk Pans, Bee and Propagating Glasses, Wasp Traps, Cucumber Tubes, Preserve Jars, with and without covers; Fern Glasses.

Plate, Sheet, Crown, and Ornamental Window Glass. Crystal Glass Shades for ornaments.

Greenhouses, erected in either wood or iron. Garden Lights and Frames.

87, Bishopsgate Street Without, London—same side as Eastern Counties Railway.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present prices of Glass for Cash:—

	SHEET SQUARES. In Boxes of 100 feet.	CROWN SQUARES. In Boxes of 100 feet.
Under 6 by 4	£0 12*s.* 6*d.*	... 8*s.* 6*d.*
6 by 4, and 6½ by 4½	0 13 0	... 12 6
7 „ 5, — 7½ „ 5½ }	0 15 0	... 14 0
8 „ 6, — 8½ „ 6½ }		
9 „ 7, — 10 „ 8, 12 by 9, 12 by 10, 14 by 10 }	1 0 0	

Larger Sizes, not exceeding 40 inches long.

16 oz. from 3*d.* to 3½*d.* per square foot, according to size.
21 oz. „ 4½*d.* to 5*d.* „ „ „
26 oz. „ 6*d.* to 7½*d.* „ „ „

SIXTEEN-OUNCE SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, THE SAME QUALITY AS WE SUPPLY TO Mr. RIVERS, and of various dimensions, always on hand.

Double-crown Glass of various dimensions in 100 feet boxes.

Glass Tiles, ¼ of an inch thick, packed in cases, containing 50, at 1*l.* 17*s.* 6*d.* per case. Packages 2*s.* each extra, but allowed for when returned.

Glass Milk Pans, 21*s.* per dozen; Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoys' Milk Syphons, Wasp Traps: Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the trade.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

HOLCUS SACCHARATUS, OR CHINESE SUGAR CANE.

(See GARDENERS' CHRONICLE, Dec. 30th, 1854.)

MR. JOHN HENDERSON, formerly of the firm of JOHN A. HENDERSON & Co., Pine Apple Place, London, has the honour to announce that he is prepared to supply Gentlemen, Amateurs, and Professionals, with seed of this most valuable and estimable plant.

As the Dioscorea Batatas seems well adapted to make good any deficiency arising from failure in the Potato crops, so this appears admirably calculated to meet many wants of the present day. That it may be used for the purposes of distillation, and may therefore preserve the grain of the country, is not less certain than that the leaf and stem (after the saccharine matter has been extracted) contain a large amount of fibre, of such a nature as can be employed in the manufacture of every kind of paper. In both these points, as well as in many others, this plant demands the attention of every Gardener and Amateur throughout the country; the more so as from the necessity that at present exists for the production of fibres that may be used in paper manufacture a due remuneration may be fairly expected by growers, even after the plant has, so to speak, paid itself by the saccharine matter extracted from it.

Mr. Henderson hopes, in a few days, to have ready for the press a more lengthened account of this plant, as well as a complete statement of the latest experiments in connection with the Dioscorea Batatas. As there are many varieties of the Holcus W. J. H. can only be responsible for seed forwarded by himself, which he is prepared to do in sealed packets, at 1s., 2s. 6d., 5s., and 10s., according to quantity.

Orders to be accompanied with a remittance to Mr. JOHN HENDERSON, Kingskerswell, Newton Abbot, South Devon.

P.S. Seed to the Trade can be had on application.

R. PARKER begs to offer the following CHOICE SEEDS, all of which are warranted new and true to name:

GODFREY'S (BLACK SPINE) CUCUMBER, the finest variety in cultivation, packets containing 12 seeds 1s. 6d.

Also the following esteemed varieties of CUCUMBERS and MELONS, in packets containing 12 seeds, at 1s. each:—

CUCUMBERS.	MELONS.
Henderson's Black Spine.	Victory of Bath.
Improved Patrick.	Beechwood.
Walker's Long Rambler.	Bromham Hall.
Manchester Prize.	Canteloupe.
Hunter's Prolific.	Duke of Bedford.
Superlative Improved.	Golden Perfection (extra fine).
Cuthill's Black Spine.	Scarlet Flesh (Anderson's).

Ohio Squasha Custard Gourd, 6d. ... ... per packet.
Antirrhinum, from named flowers, 6d. ... "
Calceolaria, from fine varieties, 1s. 6d. and 2s. 6d. "
Hollyhock, from fine named varieties, 1s. 6d. and 2s. 6d. "
Lilium giganteum, the most distinct and noble species of the genus, packets containing 20 seeds, 2s. 6d.

*** A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

UNEQUALLED NEW MELON, GOLDEN DROP GREEN FLESH.

EDWARD TILEY having purchased the whole of Messrs. Wood & Son's stock of Seeds of the above-named Melon, can with confidence recommend it to all growers of that splendid fruit. It has been thoroughly proved by an eminent Melon grower, and declared by all who have seen and tasted it to be one of the finest-flavoured Melons yet grown. It is a very beautiful colour when ripe, skin very thin, flesh firm and solid, and of a most superior melting and delicious flavour. Free setter and prolific bearer. It possesses a great advantage over others in its exceedingly handsome appearance when placed upon a table or on the stall of a fruit salesmen, and for exhibition this Melon will be the favourite.

THE KING, Superb Scarlet Flesh Melon.—This is a variety very much wanted, and which has for some time past been neglected, but is now becoming in great request; such being the case, EDWARD TILEY has just procured a stock of this most superb Hybrid Scarlet Flesh Melon, which he can recommend with as great confidence as those before sent out by him, and which have all given the greatest satisfaction to the public.

Each of the above varieties may be had in packets containing six seeds, 1s. 6d per packet.

The following fine varieties of Melons can be highly recommended, and are all warranted true:—

The Queen	1s.	Beechwood	1s.
Bromham Hall	1s.	Windsor Prize	1s.
Incomparable	1s.	Emperor	1s.
Golden Ball	1s.	Fleming's Hybrid Persian	1s.
Golden Perfection	1s.	Blackall's Green Flesh	1s.
Rowood	1s.	Bailey's ditto	1s.
Victory of Bath	1s.	Snow's Hybrid	1s.
Cameron Court	1s.	Gordon Castle	1s.
Chichester Prize	1s.		

A packet of the Golden Drop and one of the King Melon, and one packet of any other variety mentioned will be forwarded, post free, on receipt of 3s. 6d. in cash or penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman and Florist, 14, Abbey Church Yard, Bath, Somerset.

LYNCH'S STAR OF THE WEST CUCUMBER.—This might with propriety be called the Champion of the West, for it has won 11 prizes at different Horticultural Exhibitions. It is a seedling raised by Mr. Lynch, the well-known Gardener to the Right Hon. the Earl of St. Germans, Lord Lieutenant of Ireland. He has grown it for several years, and has beaten everything that has been put in competition with it, including all the newest and most recently introduced varieties. We have purchased the whole stock, having given a very large sum for all the seeds in his possession, and it is now for the first time sent out: those who want a good flavoured, prolific, and prize Cucumber, we would recommend to obtain a packet of the seeds.

It is a first-rate winter fruit, and, with careful management, can be had in perfection all the year round. It is most prolific, and bears two fruit on every joint, and as many as 42 have been counted on a single plant in a tub from 5 to 22 inches in length. The fruit is quite round, like the barrel of a gun, and free from any ribs or roughness on the skin. It has a short handle, and is in every way calculated to beat any other sort in cultivation. The spines are white, and they stand out in the most prominent way. The stock is very limited.

Three seeds, per packet, 1s. 6d. Five seeds, per packet, 2s. 6d.

The following is an official account of the number of Prizes won by Mr. Lynch, in competition with all the best Gardeners and the best varieties in the neighbourhood:—

"Royal Devon and Cornwall Horticultural Society, Nov. 11, 1854.

"DEAR SIR,—The prizes awarded you for your Cucumber are as follows:—

1851.—May 15th, First Prize	1852.—Sept. 9th, First Prize
" July 17th, Extra Prize	1853.—June 8th, Second Prize
" Sept. 4th, First Prize	" Sept. 8th, First Prize
1852.—May 27th, First Prize	1854.—June 1st, First Prize
" July 22d, First Prize	" Sept. 9th, First Prize

In all, 10 Prizes.

"I remain, dear sir, yours truly,

"NATHANIEL J. EASTON, Hon. Sec.

Mr. R. Lynch, Gardener to Earl of St. Germans, Port Eliott."

WM. E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" Pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2d. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their Patrons and the Public that their NEW CATALOGUE OF SEEDS for 1855 is now ready, and will be forwarded post free on application.

E. G. H. & Son take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list; and among the Flower Seeds only those whose beauty and merit are universally acknowledged, together with a carefully selected stock of the principal new varieties.

E. G. H. & Son beg respectfully to call particular attention to the following choice seeds of Florists' Flowers, which have been saved from a fine collection of named plants, and also to the annexed New and Choice Flowers, which they can confidently recommend, and in their Catalogue will be found the names of 20 beautiful ornamental Grasses. Also 12 variegated and ornamental foliage plants, for decorating the flower garden during the summer months, with full descriptions and other information respecting the following

CHOICE FLORIST FLOWERS.

HOLCUS SACCHARATUS (New Sugar Cane). 1s. and 2s. 6d.
DIOSCOREA BATATAS (Japanese Yam), 2s. 6d. each tuber.

February 10.

LATE WHITE SUPERB BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2s. 6d. each.

Each may be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

SNOW'S SUPERB BROCCOLI.—Every seed new and true. Sealed packet, 1s.; per oz., 3s.; pound bags for the trade on liberal terms.

GLENNY'S IMPROVED BALSAM.—Unequalled for size, doubleness, and colour; 6 classes, 3s.; mixed, 1s.; sealed packets with culture.

DOUBLE HOLLYHOCKS from noble flowers. Sealed packet, 1s.

Stamps or P.O. orders to GEORGE GLENNY, Horticultural Agent, Dungannon House, Fulham. Sales, valuations, &c., attended. Ground Laid Out, Rockwork, Ornamental Water, &c., planned and executed.

WILD'S IPSWICH STANDARD CUCUMBER, the best in the world for Table, Market, or Exhibition, 2s. 6d. per packet.

EXTRACT OF A LETTER FROM A SUBSCRIBER.—"As to Cucumbers, I have four varieties now in bearing, but the 'Ipswich Standard' eclipses the lot. I am now (11th January), cutting splendid fruit 14 to 18 inches long, coming up to your standard of 12 diameters in every stage of their growth, viz., at 12 inches long 1 inch diameter; at 18 inches, 1½ inch. I have no hesitation in saying that your Cucumber is a perfect beauty, and the best doing one I ever saw. P.S. I will send you a specimen shortly, which I would thank you to send to Dr. Lindley."

Semi-double PRIMULA SINENSIS, in five colours, the best ever seen, 2s. 6d. per packet.

"My opinion of them is that they are not only the best that have yet been obtained, but possess a new character in the velvety substance of their petals."—*Mr. D. Beaton.*

Agent, Mr. CHAS. TURNER, Royal Nursery, Slough.

THOMAS WILD, Ipswich.

MESSRS. E. G. HENDERSON AND SON will commence sending out plants in April next of their new Seedling Fuchsias, with white Corollas, both double and single, and some others with blue, violet, and variegated Corollas. (For description and price see back No. of this Journal for Jan. 27th, 1855), or a printed list will be sent free by post on application; and a coloured plate of three of the varieties will be sent post free on receipt of six postage stamps.

QUEEN VICTORIA.	EMPRESS EUGENIE.
PRINCE ALBERT.	RAFFAELLE.
MRS. STORY.	LADY OF THE LAKE.
RANUNCULIFLORA.	WATER NYMPH.
PERRUGINO.	BANKS'S FAVOURITE.

The entire stock of all Seedling Fuchsias distinguished with a white Corolla were purchased for ONE HUNDRED GUINEAS of the late W. Story, Esq., of Newton, in the county of Devon, who succeeded in introducing this great novelty. And in consequence of an advertisement which appeared a few weeks back in the *Gardeners' Chronicle* from Messrs Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of Mr. Story, and after a written communication with that gentleman (who was then confined to his bed by illness) it was thought necessary for one of the firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, when he was informed by a jobbing gardener at Newton that he had received Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son think the above explanations necessary in consequence of a great number of their customers having ordered them at higher prices than those quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to the above.—Wellington Nursery, St. John's Wood, February 10.

LIQUID AMBER.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price, and height, to Mr. JEYES, Nurseries, Northampton.

BANKS' NEW SEEDLING FUCHSIAS FOR 1855.

W. J. EPPS begs to state that he has purchased the following Seedling Fuchsias, raised by that celebrated grower, E. BANKS, Esq., of Sholden Lodge, Deal; they were the first selection from his splendid batch of Seedlings of 1854, and have been thoroughly proved. They are distinct, rich, and the greatest advance upon any of the kinds known, and cannot fail to give the highest satisfaction.

CLIMAX.—(named by Mr. BANKS.)—Tube stout, sepals very broad reflex, with a pretty curve or half circle, the points of the petals touching the seed vessel; colour, rich velvety crimson—the corolla is very large, of a splendid violet blue and great substance: habit, robust, and blooms particularly free. 7s. 6d.

FAIRY QUEEN.—Very distinct and striking, immense bloomer, beautiful waxy white tube and sepals, tinged with lemon; long well-proportioned flower; corolla large, and of a very rich plum colour puce. 7s. 6d.

GRAND SULTAN.—A very noble flower, and will be many years before it is equalled; beautiful foliage, and first-rate for exhibiting; flowers large, very stout, sepals reflex, similar to the Turn Cap Lily, and of a very rich crimson colour; corolla large, and very dark velvety purple. 7s. 6d.

MAID OF KENT.—This Fuchsia is pronounced by the following judges, viz., Mr. Edwards, Secretary to the Floricultural Society; Mr. Barnes, of Camden Nursery; Mr. Todd, of Sutton, to be the prettiest and most distinct Fuchsia yet raised; habit dense and bushy, producing great clusters of pretty reflexed blooms, of great substance, very clear waxy white, with a rich plum-coloured puce corolla, and exceedingly striking. 10s. 6d.

BEAUTY OF THE BOWER.—A very rich and perfect formed flower, scarlet tube and sepals, which reflex over the tube, displaying a beautiful dark purple corolla of great substance: habit, perfect. 7s. 6d.

OMER PACHA.—A large and well-proportioned flower, with dark crimson tube and sepals: corolla, intensely dark velvety purple: habit, excellent and very graceful. 7s. 6d.

The Set will be sent out in April.—Strong Plants, at 42s. The usual discount to the Trade where three of each are taken.

Agent:—HURST and M'MULLEN, Seed Merchants, Leadenhall Street, London.—Bower Nurseries, Maidstone.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO AGRICULTURISTS.

B. GREENING AND CO.

BEG to call attention to the Wire Fencing they are now offering at ONE SHILLING PER LINEAL YARD. It is 3 feet 9 inches high, very strong, exceedingly durable, and perfectly efficient, being warranted to turn Horses, Cattle, and Sheep. It is stronger than the common strained Wire Fencing, over which it possesses many considerable advantages. It may be firmly and effectively erected by farm labourers, it requires fewer supports than any other fence, and when fixed, although it is decidedly one of the firmest and most stable fences, yet it does not constitute that impediment to improvement that the strained fence or a hedge does, as it can be removed to another line without the expense of sending for skilled workmen.

Manufactured by Patent Machinery by B. GREENING and CO., Agricultural Iron Works, 1 and 3, Church Gate, Manchester.

N.B. Catalogues, Pattern Sheets, and Price Lists, sent per Post, on receipt of four Stamps (cost of Postage).

GALVANISED WIRE NETTING FOR GAME AND SHEEP FENCING, AVIARIES, PHEASANTRIES, &c.

2 inch Mesh, light, 6*d.* per lineal yard, 2 feet wide.
" strong, 8*d.* " "

Netting of any size or quantity, and Fencing of all kinds, supplied on the shortest notice.

WILLIAM DRAY & Co., Manufacturers, Swan Lane, Upper Thames Street, near London Bridge.

WOOLLEN NET FOR THE PROTECTION OF WALL FRUIT TREES FROM FROST, 2 and 3 yards wide, can be had of WEATHERHEAD, WALTERS, & Co., Derby. See *Gardeners' Chronicle* of Oct. 28, 1854.

HALL'S GARDEN NETTINGS; the best and cheapest for all purposes of shelter and shade from Frost, Hail Storms, and Gales of Wind. No. 0, 5*d.*; No. 1, 5½*d.*; No. 2, 6*d.*; Nos. 3 and 4, 7*d.* All 56 inches wide, and in lengths of 15, 30, and 60 yards.—Manchester.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

WEEDS ON WALKS.

MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—MAW & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

TO BE LET, EAST BOTTOM FARM, comprising Farm-house, with suitable Farm Buildings, three Cottages, and 411 acres, 1 rod, 18 perches of Arable and Pasture Land, together with the right of pasturage on an adjacent Down. The land is a light soil on chalk, congenial for Turnips and Stock, and lies well together. It is situate in the parish of Ringwold, in the county of Kent, four miles from the town of Dover, and three miles from Deal. Immediate possession may be had.—To view the farm apply to Mr. SANDFORD, Martin's Farm, near Dover; or to Messrs. OSBORN & GARRET, Estate Agents, Fareham, Hants.

TO BE LET ON LEASE, FARMS IN DORSETSHIRE, on the Milton Abbey Estate, seven miles from Blandford, and 11 from Dorchester, with entry at 25th March, and 11th October next.

1st. DELCOMBE, in the parish of Milton Abbas, containing 335 acres or thereby, whereof 140 acres are Grass, and 195 arable; the greater part a deep, friable, calcareous loam. This farm is equally adapted for a mixed dairy and corn management, or for corn and stock. The buildings are commodious, and the farm residence is picturesquely placed on a lawn, with a walled garden. The farm is tithe free.

2d. ANSTEY FARM, in the parish of Hilton, now containing 304 acres, or thereby, whereof 190 acres are Grass and Meadow, and 114 Arable. This Farm has hitherto been occupied as a dairy and corn farm, for which it is well adapted, the land being well watered and of good quality. It is capable of much improvement by drainage and otherwise, for which every facility and encouragement will be offered by the landlord. The arable part of the farm is a friable loam on chalk, the Grass land in the vale a deep earthy soil.—For further particulars apply in London, to JAMES CAIRD, 9, Little Ryder Street, St. James's; and in Dorset, to WALTER ANDERSON, Milton Abbey, Blandford.—Feb. 10.

NURSERY AND SEED BUSINESS,
ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.

Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

TO BE SOLD, the BUSINESS, GREENHOUSES, PITTS, FRAMES, and STOCK therein, containing a choice collection of Plants in the finest condition; also the Lease of the ACACIA ROAD NURSERY, situated in the best part of St. John's Wood, and close to the Regent's Park. There is an excellent Residence, with Stable, Coach, and Potting-houses. Well worthy the attention of any person wishing to carry on the business. A part of the purchase money may remain on security if required. Further particulars may be obtained of the proprietor, ROBERT YEO, Esq., 10, Victoria Terrace, Belsize Road, St. John's Wood, London.

EGGS, from the Yards of Mr. G. BOTHAM, Wexham Court.—Prize Spanish, 30*s.*; ditto Brahma Pootras, 21*s.*; ditto White Cochin, 21*s.*; ditto Grey Dorking, ditto Red Speckled Dorking, ditto Silver Pencilled Hamburgs, ditto Duckwing, Game, ditto Rouen and Buenos Ayres Ducks, at 10*s.* 6*d.* per setting of 13.—May be had by sending a Post-office-order, payable at Slough. Box and packing, 1*s.*

DORKING FOWLS.—Eggs, from remarkably large and weighty birds, of the best coloured breed, will be disposed of at 15*s.* the dozen, box included.—Address W. G., Railway Inn, Holme, Stilton, Hunts.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, Feb. 20, at 12 o'clock precisely, POULTRY and PIGEONS, many of which are first-class Birds: the Spanish Fowls comprise the brothers and sisters to those that took first prizes at Southampton, Cambridge, Reading, Salisbury, and Newport, and also those that took first prize at Colchester, from the yard of Sir Archibald Macdonald, at Lephook; very choice Spanish, from Mr. John Clarke, of Harsley Row; and first-rate White, Buff, and Black Cochins, Brahmas, Hamburghs, Dorkings, &c., from Mr. Cyrus Clark, of Glastonbury, G. C. Adkins, Esq., Edgbaston; some choice Carriers, Pouters, and other Pigeons, from J. Butt, Esq., and several well-known Fanciers.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

PEAR AND APPLE TREES AND CAMELLIAS.
FROM THE CLARENDON NURSERIES, JERSEY.

MR. J. C. STEVENS is instructed by Mr. René Langelier to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, 23d Feb. and following day, at 12 o'clock, without reserve, 1000 PEAR TREES of the most approved melting sorts, including Queen Victoria (not yet out) and others new to this country, all of which Mr. Langelier can warrant true to name and worthy of cultivation; 100 fine Apple Trees (Hammond's Pippin) raised in the island of Jersey by James Hammond, Esq., the fruit of first-rate quality, keeping till June: also a collection of Double Camellias with flower-buds and some in bloom, all of good sorts.—Catalogues one week before the Sale of Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by Mr. Halley to Sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, Feb. 22, at 12 o'clock, about 200 Choice Double CAMELLIAS, from 18 inches to 5 feet, comprising all the approved kinds, beautifully furnished with bloom buds; also a fine Collection of American Plants, comprising Ghent, and other Azaleas, Hybrid Rhododendrons, Kalmias, Magnolias, Andromeda floribunda, together with choice Ericas and Epacris of sorts, Roses, Dahlias in dry roots, &c.—On view the morning of Sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

GREAT WESTERN, NORTH-WESTERN, SOUTH-WESTERN, AND SOUTH-EASTERN RAILWAY

SEED ESTABLISHMENT, READING, BERKS,

(Under the distinguished Patronage of the principal Members of the Royal Agricultural Society of England),

FOR SUPPLYING

SUTTON'S HOME-GROWN SEEDS TO ALL PARTS OF THE UNITED KINGDOM.

A Gentleman in connection with the GARDENERS' CHRONICLE and AGRICULTURAL GAZETTE, *who is in the practice of inspecting the principal Horticultural and Agricultural Establishments in the Kingdom, for the purpose of reporting the peculiar features of each, favoured us with a visit, and the Editor honoured us by publishing a Report, from which we present the following extract* (see GARDENERS' CHRONICLE, Nov. 27, 1852) :—

MESSRS. SUTTON AND SONS', READING, BERKS.—"This important seed establishment is situated in the Market Place of the fine old town of Reading, which is easily and speedily reached by the Great Western Railway. The shop is fitted up with all the appliances and conveniences for despatch which an extensive business demands. Behind the shop is an extensive double range of warehouses, which are occupied by Garden and Agricultural Seeds, more especially Turnip and Grass seeds, of both of which Messrs. Sutton have one of the best collections in the country. Beyond the Warehouses is a Garden in two compartments, both furnished with glass houses and pits. Here the vitality of the different kinds of seeds is tested, and the gayer kinds of plants kept for decorating the shop and for sale in pots. The principal Nursery, however, belonging to this Establishment, lies on the south side of the town, in a fine level situation. Here, Roses, Fruit Trees, Evergreens, and Conifers are chiefly cultivated, together with, here and there, patches of the more choice vegetables for trial.

"Of agricultural crops, a compartment was allotted to Turnips, containing about 40 varieties of Swedes, hybrid, and other kinds. Of the former, the best appeared to be Sutton's Purple-top and Rivers's Stubble Swede. Among hybrids, Sutton's, Skirving's, Dale's and Rivers's are all especially worthy of mention. The largest Turnip in the grounds was the New Lincolnshire Red, so called from its being brought originally from that county by Philip Pusey, Esq., who presented the stock to Messrs. Sutton. Of Mangolds and Beet (which were of great size), we noticed a large red variety, called the Elvetham Long Red; a new sort introduced by Messrs. Sutton; also very finely formed Yellow Globe Mangold, besides the large Crimson Beet, and the White Silesia Sugar Beet. There were also Kohl Rabi, Drumhead, and other Cabbages, White Belgian Carrots, and a very large new orange colour variety.

"Messrs. Sutton have given up the saving of Rye, Vetches, and seed corn, in order that undivided attention may be given to the finer seeds, such as those of Turnip and Grass. Of the latter, examples of all that are valuable to the farmer, or for forming permanent pastures are collected here, and correctly labelled, so that an opportunity is afforded of inspecting their different characters while growing in the same soil and under precisely the same treatment. In the horticultural portion of the piece of land set apart as "sample ground," we remarked rows of Broccolis, Cabbages, Lettuces, &c., all growing side by side, and labelled with their names in full; also beds of choice Beets, Carrots, &c., for transplanting for seed.

"Many sorts of Potatoes had been cultivated here, but now stored away. Messrs. Sutton stated, that from notes made at the time of digging up, Soden's Early Oxford and the Early Walnut-leaf Kidney, were the earliest.

"An interesting feature connected with Messrs. Sutton's Establishment is a library and reading-room, which adjoins the office on the first floor over the front shop. One of the shopmen acts as librarian, and there is a list of the books hung up in the room, which is open to all the men and boys on the Establishment." (*From the* GARDENERS' CHRONICLE *of Nov. 27th*, 1852.)

AGRICULTURAL SEEDS GROWN AND SOLD BY

JOHN SUTTON AND SONS, SEED GROWERS, READING, BERKS.

WITH PRICES FOR THE MONTH OF FEBRUARY ONLY.

AGRICULTURAL BEET.

	Per lb.—s. d.
NEW LARGE CRIMSON; nearly as large as Mangold, contains 50 per cent. more saccharine matter	1 6
WHITE SILESIAN SUGAR, French Seed	1 0

CARROT.

YELLOW BELGIAN (excellent) ..	2 6
WHITE BELGIAN, the heaviest cropper and most certain	2 6
ORANGE BELGIAN, rare saccharine, and quite as large as the white	3 0
LARGE RED ALTRINGHAM; large and nutritious	3 0
SHORT ORANGE	3 0

MANGOLD WURZEL.

FROM SELECTED ROOTS.

YELLOW GLOBE (Sutton's selected), suitable for any soil, very large ...	1 0
RED GLOBE, suitable for any soil ...	1 0
LONG RED; this sort requires good deep soil	1 0

ASHCROFT SWEDE, very large, hardy, and of quick growth, yellow flesh with reddish top	2 3
SKIRVING'S LIVERPOOL SWEDE ...	2 0
LAING'S SWEDE; fine shape, purple top	2 0
PURPLE-TOPPED YELLOW SWEDE (Sutton's fine stock), a heavy cropper, good form, hardy, and stores well ...	2 0
RIVERS' STUBBLE SWEDE; a large and first-rate sort in every respect, especially for late sowing	2 3
DALE'S HYBRID, green-topped yellow ..	1 2
SUTTON'S PURPLE-TOPPED YELLOW HYBRID, the hardiest, largest, and most nutritious of all hybrid Turnips	1 6
GLOBE, Green	1 2
White	1 0
LINCOLNSHIRE RED GLOBE, a superior variety, presented to us by Philip Pusey, Esq., M.P., being more solid and larger than any other. (See remarks by reporter of *Gardeners' Chronicle*)	1 2
TANKARD: Red, White, or Green ...	1 0

TURNIP SEEDS (*continued*)

	Per lb.—s. d.
YELLOW TANKARD (or Tankard Swede) an excellent sort, equal to any Swede ...	2 0
SUTTON'S EARLY SIX WEEKS, very early and large	1 2
GREEN-TOPPED & PURPLE-TOPPED YELLOW ABERDEEN, each... ...	1 2
ORANGE JELLY, grown from seed received from Mr. Chivas	1 2
SUTTON'S IMPERIAL GREEN GLOBE, *shape of Matson's, but much larger, and quite hardy*	1 2
YORKSHIRE PARAGON; a fine new White Globe Turnip, as solid and nearly as large as Lincolnshire Red	1 2
SUTTON'S GREEN-TOPPED YELLOW HYBRID possesses same good properties as our Purple-topped Hybrid, is of quicker growth, and more suitable for poor soils...	1 6
HARDY GREEN ROUND; a good old sort	1 0
STUBBLE STONE	1 0
SUTTON'S CRUICKSFIELD HYBRID SWEDE; a valuable new Hybrid, between Kohl Rabi and Skirving Swede ...	3 6

PARSNIPS.

COMMON CATTLE	1 9
NEW LARGE GUERNSEY, altogether a superior kind, some of the roots weighing seven pounds each	2 6

CLOVERS.

Common Red (or broad)	Trifolium incarnatum
White (or Dutch)	Suckling (Trifolium minus)
Trefoil (or Hop Clover)	Alsike Clover
True Perennial Red Clover	Bokhara Clover

PRICES OF CLOVERS ARE FLUCTUATING.

COW CABBAGE.

	Per lb.—s. d.
LARGE DRUMHEAD, from fine selected plants	2 6
THOUSAND-HEADED, very productive, tall, branching	2 6
SUTTON'S EARLY CATTLE; this, if planted 18 inches asunder, produces a very heavy crop, and in a short time. (Sow in March and August).	5 0

RYE-GRASSES,

	Per bushel.
TRUE ITALIAN RYE-GRASS	6 0
DITTO (SUTTON'S IMPROVED) ITALIAN	7 6
DITTO (DICKENSON'S) ITALIAN ...	7 6
PACEY'S PERENNIAL RYE-GRASS...	6 0
ANNUAL RYE-GRASS, OR COMMON RAY	3s. 6d. to 5 0

MISCELLANEOUS.

	Per lb.
Lucerne (fresh imported)	1 0
Furze, for fence and cover	1 0
Broom	1 0
Dwarf Rape or Cole	0 4
White Mustard	0 4

Burnet—Spurry—Chicory.
Yarrow, or Millefoil
Buckwheat.
Field Parsley, for Sheep feed.
Potatoes, choice sorts.
Linseed or Flax, clean English.
Ditto, Riga, imported.
Giant Saintfoin, 12s. per bushel.

Not bound by the above prices after March 1, as some kinds of Seeds are scarce this season, and will probably be worth much higher rates.

Should any kind become cheaper, the reduction will be allowed, as we always take care that those who order early shall have every advantage. We shall also be happy to make special contracts for large quantities if required.

SUTTON'S PERMANENT GRASS SEEDS.

Gentlemen intending to lay down Land to Permanent Pasture, or for one or two years lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable.

OLD MEADOWS DEFICIENT OF THE MOST NUTRITIVE GRASSES AND CLOVERS may be greatly improved by sowing at this season "SUTTON'S Renovating Mixture" of Seeds at the rate of 8 to 12 lbs. per acre, price 9d. per lb. Our finest LAWN GRASS SEEDS *are highly useful to improve Garden Lawns or to form new ones.*

The following sorts of NATURAL and ARTIFICIAL GRASSES MAY BE HAD SEPARATE, at low prices. All the best and most suitable of them are contained in MESSRS. SUTTON'S MIXTURES.

Achillea millefolium (Yarrow)
Agrostis stolonifera (Creeping Bent)
Anthoxanthum odoratum (Sweet Vernal)
Alopecurus pratensis (Meadow Foxtail)
Avena flavescens (yellow Oat Grass)
Agrostis alba (white Bent Grass)
Agrostis vulgaris (common Bent Grass)
Bromus arvensis (Field Brome Grass)
Cynosurus cristatus (Crested Dogstail)
Dactylis glomerata (round-headed Cocksfoot)
Festuca durinscula (hard Fescue)
Festuca loliacea (Darnel Fescue)
Festuca ovina (Sheep's Fescue)
Festuca rubra (red Fescue)
Festuca pratensis (Meadow Fescue)
Festuca elatior (Tall Fescue)
Festuca heterophylla (various-leaved)
Festuca tenuifolia (fine-leaved Fescue)
Glyceria aquatica (water-sweet Grass)
Holcus avenaceus (tall Oat-like Grass)
Hordeum bulbosum (bulbous Barley-grass)
Lolium perenne (Perennial Rye-grass)
Lolium perenne sempervirens
Lolium perenne Paceyanum
Lolium perenne Stickneyanum
Lolium perenne tenue
Lolium italicum (Italian Rye-grass)
Lotus corniculatus (Bird's-foot Trefoil)
Medicago lupulina (black Medick Grass, or yellow Trefoil)
Phleum pratense (Timothy)
Poa nemoralis (wood Meadow Grass)
Poa pratensis (smooth Meadow Grass)
Poa trivialis (rough Meadow Grass)
Poa fertilis (fertile Meadow Grass
Poa sempervirens (evergreen)
Trifolium minus (red Suckling) (Clover)
Trifolium pratense perenne (Perennial red
Trifolium repens (white Clover), best
Trifolium hybridum (Alsike Clover)

And many other kinds, a Priced List of which may be had on application, post free.

Mixtures for laying down Land to Permanent Meadow or Pasture.

The sorts contained in these Mixtures are grown in different localities, and gathered separately, by the hand, expressly for this purpose, by which means all noxious weeds are excluded; they consist of the most nutritive kinds of Fescues, Poas, Sweet Vernal, Perennial Clovers, Loliums, &c., and each sort being kept separate, they are subsequently mixed in such sorts and proportions as are most suitable to the soil to be laid down. 24s. to 30s. *per acre*, according to the sorts which the soil may require.

Mixtures for Reclaimed Marshes and Heath Lands.

Many acres of land of this description have been successfully laid down to Permanent Pasture by us, with seeds which we have found invariably to thrive on such soil; *and the cost for this purpose will be* but 15s. to 20s. *per acre.*

Mixtures for laying down Chalky or Gravelly Uplands and Sheep Downs.

For this purpose Grass Seeds are annually collected from dry and hilly districts, where they are found growing spontaneously; and after many years' experience, we can confidently assure our friends that a *good and permanent* Sward may be obtained on *any* upland, from this mixture.

Mixtures for Laying down Water Meadows.

In this department also we have been very successful, many customers having expressed their great gratification at the effect of these Seeds. *Cost of Seed now reduced to 24s. per Acre.*

Mixtures to Lay down New Park Lawns.

For this purpose all coarse growing kinds are carefully excluded, and the Sward will at all seasons present a luxuriant verdure so desirable in Parks contiguous to the Mansion.

Clover and Grasses for Alternate Husbandry.

Mixtures for one, two, or three years Lay, at 12s., 16s., or 22s. per acre.

Renovating Mixture for Improving Old Pastures.

Many old Upland Pastures, Parks, and Meadows, are nearly destitute of Clovers, and the finer and more nutritious sorts of Grasses, in which case we are in the practice of furnishing such sorts only as are wanting; if these seeds are sown *early in the Season*, the improvement in the Pasture will be very considerable and at a small expense. *Quantity of Seed required, 8 to 12 lbs. per Acre. Price reduced to 9d. per Pound.*

Fine Grass Lawns in Flower Gardens, &c.

The great expense of cutting and carting turves from a distance may be avoided, and a *superior* turf produced in a few months, by sowing SUTTON'S LAWN GRASS SEEDS, which consist solely of the finest and shortest growing kinds, perfectly *free from moss and other weeds. Price 2s. 6d. per Gallon, or 20s per Bushel or 1s. per Pound.*

SCOTTISH ARBORICULTURAL SOCIETY.—The First General Meeting of this Society was held at 6, York Place, Edinburgh, on 31st January, Mr. JAMES BROWN, President, in the Chair.

Donations to the Funds of the Society were announced from Messrs. P. Lawson & Son, Messrs. Dicksons & Co., Mr. Thomas Methven, Mr. Galbraith, and Messrs. Ballantyne & Sons.

Office-Bearers for the ensuing year were elected as follows:—

President—Mr. James Brown, Wood Commissioner to the Earl of Seafield, Grantown, Strathspey.

Vice-President—Mr. W. M'Corquodale, Forester to the Earl of Mansfield, Scone Palace.

Secretary—Mr. James Alexander, of the firm of Dicksons & Co., Nurserymen, Edinburgh.

Treasurer—Mr. John Anderson, of the firm of Dickson & Turnbull, Nurserymen, Bath.

Committee:—

Mr. Cowan, Forester to R. Dundas, Esq., Arniston.
Mr. Dickson, Forester to F. A. Thomson, Esq., Charleton.
Mr. Gardiner, Forester to the Earl of Eglinton, Eglinton Castle.
Mr. M'Cleish, Forester to the Duke of Northumberland, Alnwick Castle.
Mr. M'Donald, Forester to the Duc de Coigny, Bargany, Ayrshire.
Mr. M'Laren, Forester to the Earl of Hopetown, Hopetown House.
Mr. M'Laren, Forester to the Earl of Mansfield, Shaw Park.
Mr. Rutherford, Forester to Sir John Ramsden, Bart., Buckden.
Mr. Taylor, Forester to the Earl of Camperdown, Camperdown House.
Mr. Thomson, Deputy Surveyor to the Right Hon. H. M. Commissioners of Woods and Forests, Chopwell Woods.
Mr. Thomson, Forester to the Earl of Stair, Culhorn.
Mr. Methven, Nurseryman, Edinburgh.
Mr. Ravenscroft, Museum of the Highland and Agricultural Soc. [of Scotland.
Mr. Walter Sang, Nurseryman, Kirkaldy.
Mr. Balden, Forester to Lord Blantyre, Lennoxlove.

Assistant Secretary—Mr. G. Lawson.

The Society have agreed to offer Prizes (open to all) for ESSAYS on the following branches of Practical Forestry; the Essays to be, in every case, founded on the experience of the author:—

I. DRAINAGE | II. PRUNING | III. THINNING
IV. STRIPPING AND CURING OF OAK BARK.

Essays intended for competition must be sent to Mr. JAMES ALEXANDER, 1, Waterloo Place, Edinburgh, the Secretary, on or before 1st of August, 1855, each bearing a certain motto, and accompanied by a separate sealed letter, bearing the same motto, and containing the name and address of the author.

The Society also invite communications on subjects connected with Forestry, for which special prizes are not offered.

The Laws of the Society, and other information may be obtained on application to the Secretary, as above.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

CEMETERIES.

WILLIAM MASTERS AND SON having been engaged upon extensive Cemetery works, are prepared to undertake the LAYING OUT and PLANTING NEW GROUNDS, as well as the Ornamenting such as are closed by the recent Act of Parliament, by contract or otherwise.—WILLIAM MASTERS & SON, Landscape Gardeners, Canterbury.

NOTICE OF REMOVAL.

WILLIAM HILL, HORTICULTURAL SURVEYOR, BUILDER, and HOT-WATER ENGINEER, late of Greenwich, to Streatham Hill, Surrey, where all communications are respectfully requested to be addressed.—Streatham Hill, Surrey.

GENERAL SEED ESTABLISHMENT, NORTHAMPTON.

JOHN JEYES begs leave to inform his Patrons and Friends that his general stock of Seeds is now complete, and that he shall feel obliged by their early orders. He has a good supply of all those various Seeds his Establishment has long been celebrated for, such as Matchless Cabbage, Imperial Cos Lettuce, Conqueror Pea, Blood Red Beet, Dwarf Prolific Bean, Snow's Green Cos Lettuce, do. Broccoli, Northampton Market Broccoli, Giant Asparagus, &c. &c.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*. Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

CHOICE CALCEOLARIAS.

J. COLE begs to offer a few dozen of his unbloomed Seedling HERBACEOUS CALCEOLARIAS from his choice stock; they were the admiration of all who saw them last summer. They are not potted off, though strong enough for large 60-sized pots. The Seed was saved from selected stock, carefully impregnated. J. C. offers them at 4*s*. per dozen, or 25*s*. per hundred. A remittance solicited from unknown correspondents.—Keyfield Nursery, St. Alban's, Herts.

PRESENT PRICES OF AGRICULTURAL SEEDS.—SEE MESSRS. SUTTON'S DESCRIPTIVE LIST, on the last page of the *Gardeners' Chronicle* of February 3d.

SUTTON'S SHORT SEED LIST.

SUTTON'S SHORT SEED LIST, *containing only the most desirable sorts, will be sent post free, in return for one penny postage draft or receipt stamp.*
SUTTON & SONS, Seed Growers, Reading, Berks.

DIOSCOREA BATATAS, or Chinese Potato, 2*s*. 6*d*. each, or five for ... ... 10*s*. 6*d*.
HOLCUS SACCHARATUS, sealed packets of 500 Seeds 1 0
" " " 1200 Seeds 2 0
THOMAS JACKSON & SON, Kingston-on-Thames.

ACHIMENES, GLOXINIAS, ETC.

BASS AND BROWN have a large stock of fine Tubers of the following, which they can supply to the trade in quantities. Prices on application.

Achimenes Cherita.
" Mr. Aparpart.
" Louis Van Houtte.
" Margaretta (best white).
" Magnifica purpurea.
" Sir Traherne Thomas.

Gloxinea Leonie Van Houtte.
" Hogoveen.
" Willsoni.
" Duke of Wellington.

Verbenas, 60 new varieties of 1854, of the first raisers.

☞ A quantity of Corræa and Pimelea Stocks Wanted.
Sudbury, Suffolk.

LIVERPOOL IS THE BEST MARKET AT PRESENT FOR

PINES, ASPARAGUS, | CUCUMBERS, MUSHROOMS, &c.

Forward to GEORGE TAYLOR, Jun., FRUIT SALESMAN, St. John's Market, Liverpool.
Terms—CASH.

PYRAMIDAL PEAR TREES,
GRAFTED ON THE QUINCE STOCKS.

J. AND J. FRASER have still to offer strong trees of the above PEARS; a Descriptive Catalogue of the sorts may be had on application. To prevent disappointment early orders are requested, as the Stock of some of the varieties is getting low.—The Nurseries, Lea Bridge Road, Essex.

FRUIT TREES, FOREST TREES, AND SHRUBS, GARDEN AND FLOWER SEEDS, PERMANENT PASTURE GRASSES, and FINE DWARF LAWN GRASSES.—Catalogues of the above may be had on application to WILLIAM BARRATT, Saint John's Nursery, Wakefield.

LIQUIDAMBAR.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price, and height, to Mr. JEYES, Nurseries, Northampton.

STRONG OAKS.

I. AND J. GAITSKILL have on hand a fine healthy stock of the above, 1½ to 2 feet and 2 to 3 feet, which will be sold cheap. Price on application.
Hall Santon Nurseries, Whitehaven; Feb. 17, 1855.

T. AND G. SWAILES having a large stock of the undermentioned, would sell at low prices—BEECH, one-year seedling fine; ASH, transplanted, 3, 4, and 5 feet; ELMS, Wytch and Scotch, &c., 3, 4, and 5 feet; HOLLY, transplanted, 1, 2, and 3 feet. Prices on application.—Beverley Nurseries, Feb. 17.

PERENNIAL RYE-GRASS SEED.

STUART AND MEIN, SEED MERCHANTS, Kelso, have on hand 50 quarters of good PERENNIAL RYE-GRASS SEED, about 15 lb. per bushel, which they cansell at a moderate price.—Apply, with reference, pre-paid, as above.

MANGOLD WURZEL SEED, LONG RED, and YELLOW GLOBE, warranted genuine, and the growth of 1854. Price 45*l*. per ton.—Apply to R. S. HEWS, Kelvedon, Essex.

IMPORTANT TO SEEDSMEN AND OTHERS.

TO BE SOLD immediately by the grower, at a low price for cash, 200 Bushels of GREEN GLOBE TURNIP SEED, all of the growth of 1854; first-rate in sample and condition, and stock warranted. To be sold in small or large quantities, at the option of the purchaser.—Apply to Mr. W. TAYLOR, Nashenden Farm, Rochester, Kent.

TO BE SOLD, Bishop's last and best PEA, 10 to 15 quarters at 56*s*. per quarter, and 7 to 8 quarters of a superior BLUE PEA, capital boiler, or an abundant bearer for podding, 56*s*. per quarter; also a quantity of genuine Skirving's Swede Seed of last year's growth, grown from large roots; transplanted and other sorts of Turnips and Mangold Seeds, &c.—Apply to Mr. GEORGE TABER, Seed Grower, Rivenhall, Witham, Essex. Delivered carriage free. Terms cash.

TO BE SOLD, at Prices that will be sure to give satisfaction, 10,000 STRONG CURRANTS of the following sorts, viz.:—Red and White Dutch, common Black and Black Naples, Wilmot's Superb Red, Champaign and Raby Castle. Also a quantity of strong dwarf-trained Pears and Plums of the best sorts, Fastolff and other Raspberries, strong standard Pears, and a quantity of prime Seed Potatoes, well kept, of the best sorts.—For further particulars apply to JAMES LAKE, Nurseryman, Bridgewater.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren very large and firm heads. Price to the trade 24*s*. per lb., smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

CONQUEROR OF THE WEST CUCUMBER.—A Packet, containing 12 good seeds of this first-rate Frame Cucumber, which for productiveness is second to none, will be sent post free, on receipt of 12 postage stamps, addressed to JAMES LAKE, Nurseryman, &c., Bridgewater.

WILD'S IPSWICH STANDARD CUCUMBER, the best in the world for table, market, or exhibition, 2*s*. 6*d*. per packet. Semi-double Primula sinensis, 2*s*. 6*d*. per packet, in five colours, the best ever seen.—Agents, TURNER, SLOUGH, FISHER, HOLMES & Co., Sheffield.
THOMAS WILD, Ipswich.

DR. SYNTAX CUCUMBER.—The above celebrated variety has been nearly lost to gardeners for several years past. It is known by all experienced growers of Cucumbers to be the very best sort in existence for early work.

A paper sent free per post on receipt of 13 stamps.

SNOW'S HORTICULTURAL BROCCOLI.—Half-ounce Packet sent free per post on receipt of 24 stamps.

NORTHAMPTON MARKET BROCCOLI.—This variety is grown by the market gardeners here, and excites the admiration of all who see it. Visitors say "they never saw such Broccoli anywhere else." Half-ounce Packets sent free per post for 14 stamps.—JOHN JEYES, Nurseries, Northampton.

MAY'S MAGNUM BONUM LETTUCE.—Parties who were disappointed last season in receiving the above, can now have it by early application, in Packets 1*s*. each, free by post. We have numerous letters to show, received from parties who had it last season, to say that it is the most magnificent Lettuce they ever saw.—Address, HENRY MAY, The Hope Nurseries, near Bedale, Yorkshire.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. COBBETT'S Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

CHEAP AND GOOD CINERARIAS.—Fine flowering plants from Turner's best seed in large 60 and 48 pots, just coming into bloom, at from 4*s*. to 6*s*. per dozen. Also fine plants of named varieties, consisting of Mr. and Mrs. S. Herbert, Adela Villiers, Garland, Constellation, Lady H. Campbell, Kate Kearney, Flora M'Ivor, Étoile de Venus, &c., at 9*s*. per dozen.—WOOD & INGRAM, Nurseries, Huntingdon.

GENUINE SEEDS.

THE MEMBERS OF THE "SEED GROWERS SOCIETY," continue to supply genuine AGRICULTURAL, VEGETABLE and FLOWER SEEDS at Growers' prices. Lists with price and terms of business may be had on application to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex.

NORTH CHINA SUGAR CANE—(HOLCUS SACCHARATUS).
NEW CHINESE POTATO—(DIOSCOREA BATATAS).

MR. JOHN HENDERSON, of Kingskerswell, South Devon, is still prepared to supply and warrant genuine Seeds of the above Sugar Cane, and tubers of the New Chinese Potato, with description of the Chinese mode of culture, at the following prices free, for cash:—

Holcus Saccharatus, in packets, at 1*s*., 2*s*. 6*d*., and 5*s*. each.
Discorea Batatas—four tubers, 10*s*.; ten ditto, 1*l*. 2*s*. 6*d*.

For further particulars as to culture, &c., see a pamphlet descriptive of the nature and progress of these plants, with directions for cultivation, by JOHN HENDERSON, price 1*s*., published by Mr. S. JOHNSON, St. Martin's Lane, and to be had of all booksellers. Post Office Orders are requested to be made payable at Newton Abbott, South Devon.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

MESSRS. J. AND H. BROWN'S NEW PRICED CATALOGUE can be had by post. American Plants, Coniferæ, Orchidea, Stove and Greenhouse Plants, Fruit Trees, &c. A separate List of Garden and Flower Seeds.
Albion Nursery, Stoke Newington, London.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

Post-office Orders to be made payable at Middleton, Lancashire.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.

To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

SUPERIOR EARLY BROCCOLI.

MITCHINSON'S PENZANCE OR EARLY WHITE CORNISH BROCCOLI.—*Published and handsomely illustrated, in February, a full-sized drawing of this most valuable, hardy, and early variety, that is the earliest, 1s. 6d. per packet, or 12s. per ounce.* Note Seed can be had in sealed packets of the following Agents in London:—Nash, Mearns, and Co., Strand; Dobie, Cuppedge, and Benham, Moorgate Street; Hooper and M'Mullen, Leadenhall Street; Flanagan and Son, Mansion House Street; or from Mitchinson's Seed Establishment, Truro, Cornwall.—December 2.

From numerous unsolicited Testimonials we select the following:—

To Messrs. Mitchinson and Co., Seed Merchants, Truro, Cornwall.

"Sirs, I have enclosed 18 postage stamps for a packet of your Penzance Broccoli Seed, the same kind as you sent me last year. I hope I am not too late, for I am anxious to procure it, if possible, for I can bear testimony to its value as a new, early, and a superior Broccoli, for I have been cutting upwards of 30 heads every week from the beginning of February.

"Dorking, Surrey, April 4, 1854. "W. Cockerwood."

To Messrs. Mitchinson and Son, Seedsmen, Truro, Cornwall.

"Sirs,—I enclose you 1s. 6d. worth of stamps and hope you will send me a small packet of the Early Broccoli you advertised last year. I have beat all my neighbours this year with your Broccoli, which has been very fine and true, and stood the winter well. "George Pender."

"Sandgate, Kent, April 10, 1854."

To Mr. Mitchinson, Seedsman, Truro.

(Enclosed with Specimen.)

"Sir,—I beg to forward you this Broccoli, one of the sort after your own name. I have had a splendid crop of them this season, many of which measured three feet in circumference, and quality excellent. Cut the first on the 11th of February. If seed is scarce, be kind enough to save two packets.—T. Rice, Gardener. Grampound, Cornwall. April 7, 1854."

OLD NURSERY AND SEED ESTABLISHMENT, NORTHAMPTON.

JOHN PERKINS, Seed Merchant & Grower, begs to call the attention of his Patrons and the Public to his General Stock of GARDEN and AGRICULTURAL SEEDS, &c., the greater portion of which have been grown by himself, and which he can with confidence recommend. Also the following kinds of Seed Potatoes, true to name:—Ashleaf, or Albion Kidney, Jackson's Improved Albion do., Golden Multiplier do., Flake Kidney, Thurston's Conqueror, Rounds, Ready Penny, Early King, Hicks' Early, Soden's Early Oxford, Early Shaws, Rillet's Flourball, American Seedling, Holland's Red.

The above may be obtained as cheap or cheaper than any other house in the trade, prices of which may be had on application. Also 100,000 one to two years' Seedling Oak, 50,000 Scotch Firs, 2 to 20 ft., 50,000 Beech, 3 to 4 ft. In addition to the above, J. P. has a very extensive stock of Fruit and Forest Trees, Flowering Shrubs, Evergreens, &c., &c., priced catalogues of which will be forwarded on application.

Nurseries about a quarter of a mile on the Bedford Road, also on the Billing Road, and at Wootton.

Seed Warehouse, Market Square, Northampton.

HOLCUS SACCHARATUS, OR CHINESE SUGAR CANE.—*For a full description, see the leading article in the* Gardeners' Chronicle, *by Professor Lindley, page 35, January 20, 1855.*

William E. Rendle & Co., Seed Merchants, have just imported from France an excellent parcel of Seeds, which will be sold in sealed packets at 1s. and 2s. 6d. each, post free.—Apply to William E. Rendle & Co., Seed Merchants, Plymouth.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 16s. per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and loam at moderate prices.—Kennard, Brothers, Swan Place, Old Kent Road.

LATE WHITE SUPERB BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight: keeps its colour, and stands firm two weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a fine Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2s. 6d. each.

Each may be had of Messrs. Noble, Cooper, & Bolton, 76, Fleet Street; and Messrs. Hurst & M'Mullen, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

DICKSON'S EARLY FAVOURITE PEA (NEW).

FRANCIS AND ARTHUR DICKSON AND SONS, Seed Merchants, &c., Chester, have much satisfaction in introducing the above new Pea, which they believe they are perfectly justified in saying is the best and most prolific Early Pea in cultivation.

It has been tried side by side with all the best early and second early Peas of the day, and has been pronounced by many eminent gardeners who saw it under the circumstances to be much superior to any variety of its season hitherto introduced.

It comes in about a week later than the "Early Emperor" (sown at the same time), grows about 4 feet high, and produces a wonderful profusion of pods, which contain on an average 11 Peas of excellent quality and flavour.

For opinions of Dr. Lindley and Mr. Thompson, see *Gardeners' Chronicle* of 20th January, 1855.

Price 3s. 6d. per Quart; per Pint, 2s. Messrs. Hurst & M'Mullen, Seedsmen, &c., 6, Leadenhall Street, wholesale London Agents; and to be had from most Nurserymen and Seedsmen throughout the United Kingdom.—N. B. The Trade supplied on liberal terms.—106, Eastgate Street, Chester; (and 14, Corporation Street, Manchester).—February 17.

NEW PLANTS.

A. VERSCHAFFELT, Nurseryman, Ghent, Belgium, begs to offer to Amateurs and to the trade his following new plants:—

ACHIMENES (TREVIRANIA), AMBROISE VERSCHAFFELT. This is the finest Achimenes of all; a correct drawing is figured in L'Illustration Horticole, Number 1, 1855. Nice plants will be sent out next May, each 8s.—N.B. One over if three plants are taken.

TYDŒA WARSCEWICZII; magnificent plant for foliage, and particularly for the flowers. It is the finest gesneriaceous plant of all; a correct drawing is figured in L'Illustration Horticole, Number 1, 1855. Strong plants are now ready for sale, each 15s.—N.B. One over if two plants are taken.

RHODODENDRON (HARDY) PRINCE CAMILLE DE ROHAN. This is the finest hardy variety raised; a correct drawing is figured in L'Illustration Horticole, Number 1, 1855. This variety is warranted to be quite hardy, and very free bloomer. Nice plants will be sent out next May, each 15s. N.B. One over if three plants are taken.

Agent in London: Mr. R. Silberrad, 5, Harp Lane, Great Tower Street.

HOPS SUPERSEDED BY THE BAVARIAN BITTER, a perfect substitute for Hops, of an agreeable flavour, quite soluble in wort or beer, saving the trouble of straining through a Hop-back, and giving to Beer the well-known keeping properties of the Bavarian Beer. Price of 1 packet, 2s. 8d., which is equal to 5 lbs. of best Hops.—Prepared only by Thomas Pratt Wills, St. George's Square, Portsea. Free per post.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION

FOR

PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. Jackson.

EXTRACTS:—

"One of the fields of this farm, the property of Mrs. Standbury, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. Baxter.

"Belmont Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. Gordon, K.C.B., Marlee House, Blairgowrie.

"Sir,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. Jackson, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. Jackson's process may be widely known, as it is a great boon.—I am, &c., John Shanks,

"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. Austen, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. Charlwood & Cummins, Seedsmen, Covent Garden; and John Kersan, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

ESTABLISHED 1786.

Mixtures (finest sorts) for forming Lawns... ... 1s. 3d. per lb.

These Seeds are are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE will shortly be ready, and will be forwarded free on application.

GEORGE GIBBS & CO., SEEDSMEN,

26, Down Street, Piccadilly, London.

THE LARGEST STOCK AND LOWEST PRICES IN ENGLAND.

JOHN WESTWOOD, the FLORAL NURSERY, Acton Road, Turnham Green, near London, having an enormous and well selected stock of SOFT-WOODED PLANTS, and most extensive premises (the glass covering 3 acres of land), is enabled to offer it to the public and the Trade at prices far lower than any hitherto heard of, but as it is impossible to convey by advertisement anything like detailed or sufficient information of the advantages or resources of his establishment, he respectfully requests all who desire to purchase plants to apply for his Catalogue for 1855 (which is now ready), and he will immediately forward it postage free.

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6s. per doz.; HOWARD'S PRINCE ALBERT, 12s. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.

Manor Farm, Deptford, Feb. 17.

NEW SHRUBBY CALCEOLARIAS.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that a Descriptive Catalogue of his beautiful new Shrubby Calceolarias is now ready, and may be had upon prepaid application.

Very choice Calceolaria and Pansy Seed, 2s. 6d. per packet. Postage stamps are respectfully requested in payment of the seeds.

MESSRS. E. G. HENDERSON AND SON will commence sending out plants in April next of their new Seedling Fuchsias, with white Corollas, both double and single, and some others with blue, violet, and variegated Corollas. For description and price see back No. of this Journal for Jan. 27th, 1855, or a printed list will be sent free by post on application; and a coloured plate of three of the varieties will be sent post free on receipt of six postage stamps.

QUEEN VICTORIA.	EMPRESS EUGENIE.
PRINCE ALBERT.	RAFFAELLE.
MRS. STORY.	LADY OF THE LAKE.
RANUNCULIFLORA.	WATER NYMPH.
PERRUGINO.	BANKS'S FAVOURITE.

The entire stock of all Seedling Fuchsias distinguished with a white Corolla were purchased for ONE HUNDRED GUINEAS of the late W. Story, Esq., of Newton, in the county of Devon, who succeeded in introducing this great novelty. And in consequence of an advertisement which appeared a few weeks back in the *Gardeners' Chronicle* from Messrs Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of Mr. Story, and after a written communication with that gentleman (who was then confined to his bed by illness) it was thought necessary for one of the firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, when he was informed by a jobbing gardener at Newton that he had received Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son think the above explanations necessary in consequence of a great number of their customers having ordered them at higher prices than those quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to the above.—Wellington Nursery, St. John's Wood, February 17

Messrs. E. G. HENDERSON & SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their patrons and the public that their New Catalogue of Seeds for 1855 is now ready, with full descriptions and other information, and will be forwarded post free on application.

E. G. HENDERSON & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list, and among the Flower Seeds only those whose beauty and merit are univerally acknowledged, together with a carefully selected stock of the principal new varieties. They would call particular attention to the following new and choice seeds, which they can confidently recommend:—

Per packet	s.	d.
Antirrhinum, extra fine ...	0	6
Auricula, fine mixed ...	1	6

NEW PLUMS.

MR. H. DOWLING, FRUIT GROWER, Woolston Lawn, Southampton, begs most respectfully to return his sincere thanks to the Nobility, Gentry, and Public generally, for the liberal patronage he has received, and informs them that owing to his Garden being about to be cleared for building, he has to offer the above at unusually low prices. Fruit Growers and the Trade will find this a rare opportunity to supply themselves with them. H. D. has received Testimonials from those that fruited them this season. He can with confidence recommend the Black Gage and Angelina Burdett as superior to any other Plum for prolificness and flavour; good strong Trees, and the prices can be obtained at Mr. CHARLES TURNER'S Royal Nursery, Slough; of Mr. HENDERSON, Pine Apple Place, London; or the Grower, at Woolston Lawn, Southampton.

GODFREY'S BLACK SPINE.

SPLENDID AND PROLIFIC FRAME CUCUMBER.

WOOD AND INGRAM beg to offer seeds of the above beautiful variety. Colour, magnificent dark green, with a very fine bloom; average length, 18 to 21 inches, and produces in great abundance through an entire season. Packets, containing 12 seeds, 2s. 6d.; 6 ditto, 1s. 6d.

W. & I. will be happy to refer any persons wishing further information respecting the variety to three or four Noblemen and Gentlemens' Gardeners who have grown it, and prefer it to any other.

London Agents: Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

W. & I. have also the following esteemed varieties to offer, in packets, 1s. each, containing 12 seeds:—

Sion House	Sagg's Royal Exhibition
Barnes's Fearnought	Conqueror of the West
Walker's Prolific	Improved Sion House
Constantine's Incomparable.	Manchester Hero.

Huntingdon Nurseries, February 17.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out. Catalogues may be had on application.

Lilium giganteum Seed ...	... per 100 seeds ...	5s.	0d.

" Shilling's	10s.	York Regent's	6s
" Martin's Globe ...	10s.	White Rough	6s.
" Oxford Large ...	8s.	French Blues	7s.
" Round Frame (for Forcing)	8s.	White Kidney	8s.
Early (Fox's Seedling) ...	8s.	British Queen, the largest and best produce in cultivation	8s.

Seed Establishment, Wisbeach, Cambridgeshire.

NEW ASHLEAF—THE "EARLY CHAMPION."

JOSEPH WILSON, SEEDSMAN, Ipswich, begs to state that his stock of early SEED POTATOES comprises the following splendid varieties, grown expressly for seed purposes, and free from disease. The "Champion" Ashleaf, 12s., a new variety, sent out for the first time this season; they are about 10 days earlier than any other Ashleaf, finer in flavour and more prolific. Jackson's improved early Ashleaf, 9s.; the Short top Ashleaf, 7s. 6d.; Nonpareil Kidneys, 6s. 6d.; Moss Kidneys, 6s. 6d; British Queens, 7s. 6d., the earliest round variety known. Early Frame and Ashleaf Seedlings, 8s. per bushel. Free to London; no charge for sacks. A remittance must accompany all orders.

J. W. begs to say that the whole of the varieties offered have been grown especially for him, and that he has no connection whatever with any other Seedsman.

MYATT'S NEW SEEDLING POTATO.
BROCKLEY KIDNEY.

W. AND J. MYATT can dispose of a limited quantity of the above excellent new Potato, which they have proved to be a first-rate variety, and has been selected as the best out of a many thousand seedlings raised at Manor Farm.

In flavour it is quite equal to the Ash-leaf, and for produce very far superior; it is a compact strong grower, and ripens off quickly, making it an invaluable summer variety. To be sent out in peck bags, 3s.; bushel, 56 lbs., 10s.

Also, EARLY MAY or BRITISH QUEEN, the earliest round Potato, middling size, suitable for planting whole, 5s.; Early Shaw, 5s.; York Regent's, 5s.; Hen's Nest, a good field Potato, 5s. per bushel; Red Ash-leaf, 2s. 6d. per peck. These are all one year's growth, from Yorkshire or Scotch sets, and will be delivered free to any railway terminus in London.

Post Office Orders are requested from unknown correspondents, payable at Deptford, to WILLIAM MYATT.

Manor Farm, Feb. 17.

RANUNCULUSES, ANEMONES, LILIUM LANCIFOLIUM, CALOCHORTUS LUTEUS, CALLIPRORA FLAVA, GLADIOLUS, TRITONEA AUREA, DIELYTRA SPECTABILIS, VALLOTA PURPUREA, ANOMATHECA CRUENTA, AND AURICULAS.

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY, begs to say that he has a fine Selection of the above BULBS, &c., which he can supply at Moderate Prices. His Catalogue will be forwarded on application.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.

J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).

CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

GREAT NOVELTIES FOR THE ENSUING SEASON,
FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

GALANTHIFLORA-PLENA

(The DOUBLE Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double Snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10s. 6d. each.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—ESTABLISHED 1720.

NEW BEDDING GERANIUM.
GAINES' SCARLET UNIQUE.

N. GAINES begs to inform the nobility, gentry, and trade in general that he can supply strong healthy plants of the above beautiful variety. In habit it is like Rollisson's Unique, producing magnificent trusses of brilliant scarlet flowers. It was exhibited at the Chiswick and Royal Botanic Horticultural Shows, where it was considered a great novelty, and well adapted for bedding purposes. Price 5s. per plant; when three are taken, a fourth will be sent to compensate for carriage.

A Descriptive List of his large Collection of Pelargoniums, Show and Fancy varieties, also Stove, Greenhouse, and Hard-wooded Plants, may be had post free, by applying at the Nursery, Surrey Lane, Battersea, Surrey.

NOW READY.

For description see "RENDLE'S Price Current and Garden Directory for 1855."

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 17, 1855.

THE thermometer in the Valley of the Thames has been within the last few days almost as low as at any time since gardens have been enriched by the numerous half-hardy plants now so common. On the night of Saturday the 10th FAHRENHEIT's thermometer in the Garden of the Horticultural Society fell to 1° above zero, and a radiator to three degrees below. On the night of the 13th it fell in the same place to zero, and the radiator was 6° lower. To this we have no recent parallel except in the spring of 1838, when at Chiswick, the ordinary thermometer fell to 4½° below zero and the radiator to 12° below on the night of January 19, after which the temperature rose, so that on the 21st there was a thaw, which on the 22d became rapid, revealing all the disastrous effects of the rigorous weather.

Low as the thermometer certainly was at Chiswick on that occasion the cold was nearly as severe or still more so in other parts of the south of England, according to several independent observers. At Seven Oaks in Kent, Mr. ROGERS recorded 3° below zero, when his instrument became deranged, and the true minimum could not be ascertained. At

Beckenham it is said to have sunk to 13½° below zero at 7 A.M.; at Redleaf it was 1° above; at Cambridge it was seen at 3° above at 11 P.M.; at N. Stonham it was at zero; at Claremont it fell to 12° below, and at Walton on Thames to 14° below; at Worthing it was only 2° above, although it did not sink lower than 9° above at Arundel, 18° above at Bicton, and 15° above in the Isle of Wight.

It is superfluous to show how disastrous were the effects of that frost where it was felt in its greatest intensity. It is sufficient to say that the kitchen gardens round London were left without vegetables, that the Furze all died above ground, that the Vine was killed in several vineries, and that Strawberry plants in pots, prepared for forcing, lost their flower buds except where they were carefully protected.

What we shall find to be the effects of the present frost it is useless to conjecture; the reality will be apparent soon enough. In the meanwhile our readers may be interested in the following little facts, which are already ascertained.

In the glass wall in the garden of the Horticultural Society, the slight protection afforded by the glass and *iron* caused a considerable diminution of cold; thus on the night of the 10th when the external thermometer fell to 1°, that in the inside of the wall was not below 14°; and on the night of the 13th, the thermometer outside marking 0°, that within the wall marked 13°. Such a difference was probably attributable in great measure to the stillness of the atmosphere. It was sufficient to preserve the foliage and the flowers of Chinese Primulas, as well as *Callistemon lanceolatus*, *Viburnum suspensum*, *Edwardsia chilensis*, and similar half-hardy plants.

The effect of snow, even in small quantities, as a protecting material, was strikingly shown on the night of the 10th. While the exposed thermometer stood at 1°, another close by, covered by two inches of loose snow, was not lower than 20°, owing to the extremely bad conducting power of that substance. Hence arises the probability that in bad snowy climates, or, in even bitter climates, half-hardy bushes might be preserved by piling snow around and over a framework made to guard them. A difference of 19° in such a case as that now mentioned, with a guard of only 2 inches of snow, is, we believe, a fact quite unexpected.

From what is already known concerning the important influence of ground temperature on vegetation, it is probable that the effects of frost will always be found mitigated when that is high, and aggravated when it is low. We know how little plants suffer in the United States under that load of snow which prevents the escape of heat from the soil. To what extent the small amount of warmth belonging to the earth of this country really protects vegetation is a point to be ascertained: that, low as it is, it affords some protection is unquestionable. Perhaps the next few weeks may throw a gleam of light upon this matter. As a guide to those who have the means of investigating the subject, we may state that the following are the thermometrical facts which bear upon it.

In 1838 the thermometer at Chiswick fell to +4° on one occasion, and a few days after to —4½°. The lowest ground temperature was found to be 33° at 1 foot below the surface, and 35° at 2 feet.

This week the thermometer at Chiswick fell to 1° on one occasion, and a few days afterwards to 0°. The lowest ground temperature has been ascertained to have been 35° at 1 foot below the surface, and 37¾° at 2 feet. We have therefore had an excess of from 2° to 2¾° of temperature in the ground, and of from 3° to 4½° in the atmosphere; to which has to be added all the advantage of the long dryness and previous coldness of the present season. Theoretically, such differences ought to have a sensible effect in protecting plants; whether they really will have we shall know hereafter.

An Arboricultural Society has been formed in Scotland, with Mr. Brown, lately the victim of Treasury intrigue, but now Wood Commissioner to the Earl of Seafield, for its President, and some of our most experienced foresters on its committee, among whom we may mention the names of M'Corquodale, Cowan, Dickson, Gardiner, M'Cleish, M'Donald, the two M'Larens, Rutherford, Taylor, Thomson, of Chopwell; Thomson, of Culhorn; and Balden. This shows that whatever some gentlemen may think, those who really know what foresting is are of opinion that there is room for improvement, upon even the brilliant management which has been displayed in the Royal Forests. It is only just to the veteran Billington to say that the necessity of forming such an association has been advocated by him as long as we remember his name.

We regret that the limited space at our command renders anything like a report of the proceedings at the first meeting of the Society impossible. The following summary will, however, convey to the public some idea of the views of those who are its promoters.

After reminding the Society of the wonderful strides which the art of agriculture has made since the general establishment of societies for its advancement, and of the remarkable progress of horticulture from the operation of the same cause, the President proceeded to the following effect:—

"Should the art of arboriculture be discussed in as skilful a manner as these two sister arts; if the dross that adheres to it shall be as completely separated through the influence of science; if only its truer principles and methods shall be retained, and established upon a broad and solid foundation, we have no reason to fear that a similar result will not follow in regard to forestry. In looking forward, therefore, to the results of this association, I cannot but express my conviction that a new era is about to open on our business; and that the time is not distant, when not only foresters, but all the landed proprietors of the country, will attach themselves to an association on which their interests may so much depend.

"Arboriculture is, however, a more difficult subject than farming or gardening, inasmuch as a greater length of time is necessary to develope improvements, and conduct them to a profitable issue. And this is no doubt the reason that the cultivation of trees on sound principles has been so much neglected, so that their culture as a crop has been attended with unsatisfactory pecuniary results. Instances, however, are not wanting in which this branch of rural economy has been conducted on sound principles, and then it has invariably been found to be productive of profit to the proprietor—both directly by the proceeds of its produce, and indirectly by the shelter of trees enhancing the value of the arable land. Such examples, many of which I could point out, justify the expectation that were all plantations treated well, similar results would follow. But although many instances of well-managed plantations can be indicated, still I believe that every intelligent forester will agree with me that this happy condition of things is of limited extent; and that at least two-thirds of the plantations in Great Britain are at the present time so dealt with that their condition is hopeless, whether as a profitable or ornamental crop. This assertion may to some appear overstrained, but it arises out of my own experience in surveying woods in all parts of the country during the last 10 years.

"In England I have seen Oak plantations of nearly 30 years standing, with the trees in them only from 4 to 5 feet apart, not the slightest attention having been paid to thinning; of course, the crop consisted of mere poles. I do not know how profitable results should follow such management. In Scotland, too, I have found the same state of things—plantations unthinned for 35 years, the trees 4 feet apart on the average, and consequently so slender that to improve them was hopeless. Such examples are, I think, sufficient to show that there is great room for improvement in arboriculture, both in England and Scotland, and that it is for this desirable object that we have formed the Arboricultural Society, through which we hope to embody the experience of practical men, and to disseminate sound views on the subject."

After dwelling at considerable length upon the indispensable qualifications of a forester, Mr. Brown added:—

"Practical men in all branches of rural economy have been more disposed to follow the guidance of their own experience than to accept the light of science; hence the comparatively slow progress, till very recently, made in farming and gardening. The same remark applies to forestry. Hitherto foresters have been content to act by the uncertain light of their own experience. But now the application of science to those branches of cultivation is taking firm hold on the minds of all improving and enlightened men, and exerting its influences accordingly. If the great progress these arts have recently undergone is to be ascribed almost wholly to the example and influence of a few who, in advance of their fellows, have seen the importance of the aid of science and availed themselves of its resources, may we not hope that a similar result will ensue in the case of forestry? I have great pleasure in being able to testify that within the last few years, I have met with many highly intelligent and experienced foresters, several of whom are already members of this Society, who have availed themselves of the aid of science, and who are therefore an ornament to the profession. I am also happy to add that great exertion is being made by young foresters to acquire knowledge, and I feel warranted in saying that I have no fear as to the ability of foresters to carry out the scheme of this Society, provided only they meet with the assistance of those who are to be most benefited by their knowledge, I mean the landed interest of the country. Such assistance will, I believe, in due time be given. At present, our object must be to show that the Society is to be of advantage to proprietors generally; this proved, they will not hesitate to give their cordial co-operation."

Mr. Brown concluded by pointing out at length what he conceived to be the practical objects to which the Society should more especially direct attention.

The address of the President was succeeded by a communication from Mr. Thomson, the Deputy-Surveyor in Chopwell Woods:—"The business," he observed, "which we more immediately profess, has been so allowed to slumber as to seem as if upon its death-bed; and unless a feeling had recently been awakened in its behalf, it is to be feared that it might, sooner or later, have altogether slipped out of the catalogue of rural sciences. I say that a warm feeling has lately been enkindled in its favour; and if the feeling of inquiry which has lately been enkindled into the condition and capabilities of the woods and forests of Great Britain is judiciously strengthened, there is little doubt but a renovation of the entire system may be the result. Dictation on the part of this Society must, however, be carefully guarded against; but if the members of this Society bring themselves fully to understand the nature and responsibility of their self-imposed duties, there is no room for doubting that they will ultimately accomplish a greater or less amount of good. To a few foresters only are the principles upon which their art is founded known, and though you may find an active and intelligent brother here and there, it will be found in many cases, that those to whom is entrusted the rearing and management of our plantations, are destitute of the knowledge of the very elements of their profession. Indeed, we have frequently seen men, who, from age or accident, had become incapacitated for the performance of the ordinary duties of humble life, placed in charge of a district of woodland. It is needless to suggest how unprofitable such an arrangement must be.

"It should not be forgotten that forestry is a science, and, when intelligently practised, has to be studied as such, and that professional as well as general qualifications are necessary to its successful development. Foresters should therefore study accordingly. They should make themselves acquainted with the nature, history, habits, and peculiarities of all the plants with which they have ordinarily to deal; the different kinds, qualities, and capabilities of soil; the sources and effects of disease; the nature of climate, atmospheric influences, and other important particulars; so that, understanding their profession theoretically and practically in all its branches, it may become a fixed system, and cease to remain, as heretofore, a tissue of ill-wrought experiments.

"I maintain, then, that every young man who wishes to become a forester should serve an apprenticeship on an estate where the several departments of forest labour are extensively prosecuted, the management of a nursery included; he should afterwards endeavour to find employment for a few years (as he readily will) on other well conducted properties, staying about 12 months at each, and changing the scene of his operations as much as possible; and when this is done, he will find himself better able to undertake with confidence the superintendence of the woodlands on a large estate, than if he had remained for half a life-time in any single locality, imbibing only the traditions of his grandfathers."

This promises well. The advice given by both speakers is sound and should be followed. If that is done we may hope to see our English woodlands everywhere brought by degrees into a more prosperous state. If that is not done, and men continue to look to the Royal Forests as examples, we can only say that they must not expect either pleasure or profit from their property, but must rest contented with being picturesque.

VEGETABLE PATHOLOGY.—No. LIX.

267. Apostaxis.—*Constitutional and Organic.*—1. Bleeding.—The flow of sap in the spring is often so energetic as to try the resisting powers of the conducting tissue in the absence of a sufficiently strong compensating force of evaporation. Under such circumstances it either causes lesions of the tissue of more or less consequence, or avails itself of ruptures already present. In the Vine, Birch, Elm, Maple, and other trees which are subject to bleeding, if the spot from whence the fluid issues be carefully examined, there will generally appear some little fissure in the wood and bark, or some decayed spot, which is frequently referable to a shoot which has been broken off or has perished in consequence of the more urgent demands of larger branches, which have appropriated

its nutriment. It is asserted by Meyen and others that in these cases the spiral tissue becomes a conductor of fluid — a position which is at present, to say the least, extremely doubtful, and supposing it a well ascertained fact, it would be so aberrant from the assumed agency of such tissue in containing air, as to imply of itself temporary diseased action, even should the expansion of the leaves restore matters to their former state of equilibrium. It is obvious that if the consequences were confined to a temporary abstraction of superabundant fluid, health might eventually be altogether unimpaired, as in the analogous case of slight epistaxis, or nose bleeding in the human frame, forming an outlet at the expense of an unimportant temporary lesion of the vessels for the relief of the system. But unfortunately, in the vegetable kingdom, where lesion has once taken place it is not always so easily repaired, and a flow of sap once established in a certain direction may become chronic, and induce, by means of an extravasation of the fluids in the surrounding tissues, a diseased condition of the cell-walls, leading to gangrene and ultimate decay. In some cases, as in the open ulcers which are not uncommon in Elms, the discharge may be traced inwards to a collection of corrupt fluid due to the decomposition of the water or sap which has percolated through decayed tissues, and the matter which it may hold in solution. In other cases, the fluid, instead of presenting the colour of decayed wood, blackens everything it touches, is peculiarly fœtid, though extremely attractive to wasps and flies from its saccharine nature, and is evidently due to sap in a far greater degree of concentration. It is not in general traceable to any particular spot, but the whole of the surrounding woody tissue is impregnated with the same disagreeable odour, insomuch that when a tree so affected is felled, it is extremely unpleasant to stand by while the portions of the wood which are saturated with the fluid in question are severed by the axe. Sometimes where there can be no pretence of any inherent disease, as in the case of a sound tree—the Horse Chestnut, for example—cut down when the sap is commencing to flow, the discharge from the divided surface will put on the same fœtid character, in consequence of undergoing putrescent fermentation.* The discharge, however, in many cases seems to differ very slightly from ordinary ascending sap, though the stream is often altered in appearance externally by the production of such fungi as the orange-coloured Fusisporium ebulliens. Independently of any ulterior consequences, the perennial loss of a considerable quantity of ascending sap can scarcely be consistent with perfect health; and in the cases where the discharge is saccharine, the evil is of course aggravated, and the ultimate destruction more inevitable. If the affection is inveterate, the case does not admit of relief, for any suppression of the issue in one direction would only lead to rupture in another; but if the continuance of the affection has been due to ulterior causes, it may be possible to remedy the evil by freely opening the parts and the removal of decayed matter, after which protection from external agency may be supplied by varnish, collodium, or such other remedy as the particular circumstances may suggest. In pruning, it is of consequence that every diseased fragment or patch should be removed; and in those trees which are subject to much bleeding, the operation should be performed as early as possible, to insure the healing or hardening of the divided surface. In some cases, as in the Birch and Sugar Maple, where the sap is peculiarly plentiful, artificial means are taken to divert the fluid. In such cases, as the auger is passed half an inch into the wood itself, it should seem that the ascending sap is principally collected, and indeed exclusively, at the early part of the season; but in either case the process can be carried on only within certain limits without affecting the health of the tree materially. Loudon mentions the case of Count Wingersky, in Moravia, who planted the Sugar Maple extensively, but whose trees soon became sickly and died, in consequence of drawing sap from them every year. *M. J. B.*

EARLY PEAS.

"Shall you be able to gather a dish of Peas in May?" was a frequent inquiry amongst gardeners 40 years ago. The self-gratulation of the one as the question was answered in the affirmative, or the disappointed look of the other, fully expressed the importance of having an early dish of Peas; for, however unfavourable the soil or locality might be, the gardener knew well that if his neighbour had a dish of Peas in May, his failure would be attributed to his neglect or want of skill. Comparison of the means and assistance at his command would be made with those of his more successful neighbour, and remarks elicited tending to sour and make his temper as ungenial as the stiff, wet, undrained soil he had to cultivate; for it was then the practice, and with many it is still continued, to sow the first crop of Peas in November or beginning of December, notwithstanding the many casualties and failures to which they are liable, for with every care bestowed in covering with dry cinder ashes, &c., the mice find them out and carry them off to their winter dormitory, which causes the crop to come up patchy; the slugs, too, come in for a share of the spoil in defiance of the frequent application of lime, for in some seasons their name is Legion, especially in heavy soils. But even after struggling through these mishaps they are frequently attacked by an audacious flock of sparrows. In vain are all the recommended remedies for such a disaster tried; threads of all qualities and colours, feathers of every dye, dead cats, live cats, cats painted on boards, rattles, and jingling glasses, are of little avail against these determined freebooters. No, no; the sparrow is too familiar with man and his ways to take alarm at any subterfuge of that sort; he must find you a resolute foe armed with your gun before he gives way. The remnant of the Peas, however, still excites our hope; those that were cropped over send up fresh stems; the season advances, the growing weather of spring sets in, the surrounding vegetation assumes a vigorous and a healthy growth, the carefully tended Peas make progress. At last the embryo blossoms appear, but expectant hope is doomed to disappointment; still their stems are cankered, the foliage becomes yellow, and a frosty morning or two makes the failure complete. Such is the history and my general experience of a crop of Peas sown in November or December.

To gather early Peas is as important to the gardener now as it was 40 years ago, but in that long period I have only three times pulled a dish in May; it is true, some of my brother gardeners who had to cultivate a dryer soil in a warmer locality have succeeded once in five or six years in obtaining the desired result, and now that we have decidedly earlier varieties, the average will be less if the seasons are favourable, for the frosts, as the crop is coming into bloom, will retard the earlier Peas. The well-informed and reading portion of young gardeners have every opportunity of becoming acquainted, at least theoretically, with the means adopted at the present time to have a dish of early Peas, and who among the many aspirants to the highest rank of gardeners will fail to read, as far as the time and means at his disposal will permit, the principal periodicals on gardening of the present day? To neglect this will be to fall out of the rank and file of his calling to join the brigade of the "rule of thumb," the irregular and awkward squad of gardeners. There is one advice, however, which has frequently come under my notice, and which is so plausible that I have no doubt it has been frequently followed by eager and unexperienced gardeners, "Sow on strips of turf, forward them in a mild heat, and afterwards harden them off;" or thus, "Sow thinly in a one-light box, give a gentle heat, harden off, and transplant," &c. Now, I cannot say that this is judicious advice, for to bring forward Peas in heat, however mild, will stimulate their growth, so that their stems will become attenuated, and how they are to be hardened off to withstand the severity of the weather afterwards those who have tried the plan will best know. It has, however, frequently been a source of regret to me to have seen the unskilful attempt and its futile result. But I will not comment further on the means adapted by others, but give an account of my own practice; and here I would observe that I have nothing new to offer, but will simply state those conditions frequently gleaned from the experience of others, but which have been introduced into my own practice, as I have found them conducive to early and profitable results.

For many years I have discontinued sowing Peas in November or December, being fully convinced from my own experience, as well as from a careful comparison with the practice of other gardeners in the same neighbourhood, that it was merely throwing away seed and time. Another reason, which is frequently overlooked, is that the warmest and best places are invariably appropriated to the early sown Peas; thus throwing the sowings which are most to be depended on to more exposed situations, and if these sowings consist of what is now called second earlies the failure of the first crop necessarily makes the first dish of Peas late indeed.

In the first week in January, the first sowing of an early approved sort is made in 10-inch pots, or boxes 3 feet long by 10 inches wide, and 10 inches deep, but I prefer pots; have ready a sufficient quantity of soil, consisting of two parts well decomposed leaf-mould, one part loam, and one part sand. Fill the pots to within 3 inches of the top, shake the pot to level the soil, sow thinly over the surface, and fill up. From 2 to 3 quarts will be sufficient to sow in pots for a first crop. Place the pots in a cold vinery or pit where there is admitted at all times an abundance of air; 2° or 3° of frost will do no harm to the Peas. When the plants have just got through the soil, let them be placed in a three-light frame, the lights to be constantly kept off in mild weather, and tilted at night, so that a slow and hardy growth may be obtained. If severe frosty weather sets in, cover up night and day, and be particular not to expose them to the sun if frosted. The careful gardener will take care that neither sparrows nor mice have access to the Peas.

In the mean time the ground in which they are to be planted should be well limed and ridged up until such time as they are ready to plant out, which in favourable weather will be towards the latter end of February. Let the ridges be levelled down, and rows 4 feet apart marked off. Stretch the line and cut out trenches from 7 to 9 inches deep, turn the Peas out of the pot, and separate them, leaving two or three together; have a barrowful of the same soil in which they were sown ready, place the Peas in the ridge as if planting box, fill up with the fresh soil, press it gently against the roots, let one inch of the top of the Pea be above the soil, make a ridge of the spare soil on either side of the row, and point over the soil between the rows to give a workmanlike finish; when the Peas have grown 4 or 5 inches high, let earth be drawn to their stems, and stake them—they will require little more attention than an occasional survey to see if the slugs or sparrows molest them. These transplanted Peas are the forlorn hope of the season, but if well managed, they rarely fail or disappoint the cultivator.

The next or succession crop is managed thus, an open, airy quarter being selected, it is limed and ridged up in the autumn; the first fine, dry weather the following February the ridges are levelled down. If the ground is light it is trod over and raked evenly; drills are drawn from 4 to 6 feet apart, according to the height of the variety sown. I then sow 1 or 2 quarts (the quantity sown at one time will depend entirely on the demands of the family) of the same sort as was sown in pots, a quart of the best second early, a quart of Dwarf Imperials, a quart of Champion of England, 2 quarts of tall Marrows, the best variety according to taste of consumer; these if all sown on the same day will come in succession, care being taken to keep up the supply by sowing Imperials, Champion of England, and the Marrows as each previous sowing respectively comes up; the early sorts will now be discontinued, as it will in general be found that the tall Marrows give the latest supply. If dry weather sets in a trench about 1 foot from either side, and along the row, should be made and saturated with water to keep the tall Peas in a healthy state; every one knows the utility of having the Peas well staked, so that a free circulation of air may be maintained among them. *James Falconer.*

MANAGEMENT OF SEEDLING PEAR TREES, UP TO THE PERIOD OF THEIR FRUITING.

The seed of a Pear, taken from a well-formed fruit of first-rate quality, produced by a naturally vigorous tree belonging to a good race, being sown at the end of September, with all the precautions already pointed out, in light deep soil, remains fixed in this by its strong radicle for the first year. The shoot gradually acquires firmness and strength, and commences to throw out some branches. Each seedling plant exhibits peculiar characters which, in the course of the summer, are subjects of observation for those that are in the habit of experimenting. The young plants should be frequently weeded, and the surface of the ground kept loose by stirring. The young shoots that are too near each other along the stem, should be thinned by cutting them close to their bases with a sharp, narrow-bladed knife. These are all the attentions which the seedlings require in the first year of their growth.

In the following spring the seedlings should be taken up, and their tap-roots shortened. The plants should then be replanted in a quarter of rich deep soil, in rows 2½ feet asunder, and 1 foot apart in the rows. In order to encourage fresh roots, about half a shovelful of well decomposed dung is put under the tap-root of each. During the growth resulting from the first flow of sap, and especially towards Midsummer, all branches or shoots that are too close, or badly placed, are cut off closely, without, however, touching the upright leading shoot, which is allowed to grow till it attains the height of 10 feet. Some of the weak or slender-growing seedlings may require the support of a small stick to keep them upright. The stick should be placed so as to best resist the effects of the south-west winds. The young stem is tied to it with matting; but at the fall of the leaf the stick should be immediately removed. We have a great antipathy to all supports; for these, by being driven into the ground, injure the roots, whilst the ties impede the free circulation of sap in the plant, and serve as a harbour for insects. The stakes, moreover, by the action of the wind, are apt to fret and wound the young bark. For these reasons, stakes should never be employed, except where they are absolutely indispensable. The young seedlings ought to be induced to take an upright direction by means of disbudding and shortening the laterals. If it should be found necessary to shorten the central leading shoot, a slight rod should be attached to it in order that the upright direction of the shoot may be thereby insured. This remark, which is here necessarily introduced, is of general application, and need not be repeated.

In the autumn, or rather towards the end of February, if the soil in which the seedlings are planted does not appear sufficiently rich, the surface should be stirred, and enriched with liquid manure, made with cow-dung steeped in water. This will start the plants into vigorous growth, which must be regulated by thinning the laterals with the view of encouraging the upright shoot. In the autumn of the second year after planting out, all the seedlings noted as possessing the most promising characters should be taken up and planted in a soil more rich in humus, in rows 3½ feet apart, and 3 feet from plant to plant in the row. The others less promising, are planted in a compartment by themselves. The seedling must be pruned, disbudded, and pinched according to the principles applicable to the pruning of standard pyramids, with this difference, however, that in the second and third year after planting, the shoots of the seedlings are left at greater length. It will be understood that tall-stemmed pyramids are preferable to dwarf-stemmed ones, because vigorous seedlings show their first fruits on the upper part of the tree, and therefore it would be perfectly useless to form a dwarf pyramid at an additional expense of labour. There are however exceptions as regards some seedlings, which show a disposition to form dwarf pyramids, and should

* I have heard of considerable annoyance being experienced in the neighbourhood of London from this cause. The roots of trees, however, are so often injured by noxious exhalations from the soil in such situations, that there may possibly be good reasons for chemical change which may not be immediately apparent.

be managed accordingly. Successive transplantations effected in the first instance at the end of winter but afterwards at the fall of the leaf, induce the production of lateral roots, and accelerate the formation of fruit buds. The roots, divided in proportion to the above ground ramifications of the seedling, maintain these in due proportion; but it has been remarked that the case is quite the contrary with seedlings not removed.

The trees should be removed every two years, and replanted at wider distances, according to their growth, until fruit spurs begin to form on the upper part of the leader, or on the principal branches of the stem; the leading shoots are then left at greater length, and transplanting is no longer practised. In pruning off the branches of the stem up to six feet from the ground, the spurs and some small branchlets only are left. The crown is not allowed to commence below the height of six feet, because, as has been frequently stated, a vigorous seedling only commences to bear above that height. It is desirable that seedlings should be in a bearing state as quickly as possible. At the present time it is not unusual to see Pear trees bearing fruit in the eighth or ninth year of their existence from seed. This early bearing is ascribed to various causes. The late Van Mons attributed it chiefly to successive sowings, in consequence of which the last generation of Pear trees has arrived at a more civilised state. This opinion is generally adopted, and appears to be supported by the results obtained.

Others partly attribute this precocity to good management, according to which the seedlings are raised agreeably to the principles above pointed out. One of the principal causes is the biennial removal of the trees, and a good system of pruning, whereby the useless wood is removed, and the force of vegetation concentrated in the part of the tree where fruit is most likely to be first produced.

After a seedling begins to show for fruit, it should not be removed until we can form a definite opinion of its productions.

In a special article connected with this subject we shall point out the means to be taken for fixing the character of a new and good variety, so as to prevent any future change of name. But it is necessary, in the first place, to state the characters by which promising seedlings may be distinguished from such as are unpromising. *J. de Jonghe, Brussels, Jan.* 21.

COMMON THINGS.

Pruning Currants and Gooseberries.—The pruning of Currant and Gooseberry bushes is seldom performed in cottage gardens, the consequence of which is that every bush in time becomes a mass of wood, producing a quantity of worthless fruit, without either size or flavour. This is to be easily remedied by a little attention to pruning the bushes in winter, and never allowing the branches to be too crowded, or to interfere with one another. The shoots which spring up in the centre should be cut away very closely, as well as the small shoots on the main branches, leaving only one at their points, which must be shortened for about a third of its length. If this is done, the bush will have the form of a cup, with the branches ranged regularly round the stem,

as in the accompanying woodcut. Red and white Currants require the same treatment, as they produce their fruit on spurs in the way of the Gooseberry. The black Currant must be managed differently, as it bears chiefly on the shoots of the preceding year; instead, therefore, of spurring and otherwise shortening the branches, all that is necessary is to thin them, and keep the bushes compact.

GRAFTED RHODODENDRONS.

The health and vigour of a grafted Rhododendron, like those of every other grafted plant, will, of course, depend very much upon the condition of the stock. It will be useless to expect a luxuriant head of foliage if the stock is unhealthy and "hide-bound;" and all care and attention in inducing it to become otherwise will be thrown away. Large plants, not grafted, have frequently some of their principal shoots in a stunted and inert condition. The only remedy is to cut away all such shoots, and, by encouraging those remaining, as well as by inducing new wood, to form a new plant. This cannot of course be done where the stock of a grafted plant is the source of the evil. It is, however, very rarely that such a contingency arises in a grafted plant, when the stock has been well chosen, and the treatment has been liberal. And as to the stock of a grafted plant throwing up suckers, we can only say that among the many thousands grafted by us every year, we do not experience any inconvenience from that cause at all worth speaking of. A few suckers are certainly found occasionally upon recently grafted plants; but, these being removed, after two or three years' growth, and if in good health, the head, absorbing all available nourishment, wholly checks any tendency to produce them. The condition which "J. R." describes as being a natural and invariable contingent to a bed of grafted Rhododendrons, could only exist under the most slovenly gardening, if indeed, such could be termed gardening at all; and would never be permitted by any one having the least love for his garden, or the shadow of a claim to the qualifications of a gardener. One might just as well argue that, because some particular man, who happens to be a gardener, is a dirty untidy fellow, that filthiness is a natural result of his calling.

It has been urged by "J. R." that because grafted plants in a nursery, a certain number of years old, are not so large as others of the same age not grafted in some private grounds with which he is acquainted, it must follow that grafted plants will not grow so luxuriantly, or attain so large a size, as plants raised from seeds or layers. With a limited knowledge of the facts of the case there certainly appears a show of truth in this mode of reasoning. But "J. R." ought to know that the object of a nurseryman is not merely to grow large plants, but also to keep them ready for removal without risk; and that to effect this he frequently transplants his saleable stock, thereby checking, of course, the growth of such plants, and preventing them from keeping pace with others not so removed. The difference in the amount of a year's growth between two plants, the one thoroughly established, and the other subject to frequent removals is, of course, great—in an aggregate of years it is still more perceptible. Then as to "J. R.'s" presumed advantages of layered plants over grafted ones, they are equally untenable with those which he argues in favour of seedlings; and besides, layering as a mode of propagating the rarer and better kinds of Rhododendrons has many practical disadvantages. In the first place you must have a tolerably large plant to operate upon, and, secondly, the system admits only of very limited powers of increase. Suppose a handsome seedling variety is raised, from which it is desired to propagate, by layering you sacrifice the original plant for the sake of obtaining, perhaps, half-a-dozen small ones; by grafting you secure a numerous progeny without materially injuring the parent;—for a layer you require a branch, for a graft a bud with an inch of wood to it. In truth, layering the Rhododendron as a means of propagation, when compared with grafting, is very limited in its application, and possesses few advantages. It is principally of use to private growers, in cases where it is wished to secure tolerably large plants of a particular kind; for the purposes of trade, or for effecting an extensive and ready circulation of a given plant, it is all but useless.

A branch, the size of a moderate plant, and with many flower buds, may be taken off as a layer, and such is often done by others than private growers, with shy-blooming kinds, such as many of the first hybrids from the scarlet arboreum, and which "J. R." so warmly eulogises. Nice compact plants of these, with flower buds, are frequently and eagerly purchased, and chiefly in consequence of their having such flower buds. In the blooming season following, the purchaser has of course a display of flower, not so, however, always in the succeeding one. There are many very richly coloured Rhododendrons, which are worthy of all praise when they do condescend to exhibit a head of flower; but, from the rarity of such, they are not desirable for introduction into general collections.

Next week we shall have something to say on the subject of seedling Rhododendrons. But in concluding this paper we reiterate that for the general purposes of propagating the finer or new kinds, grafting is in every respect superior to layering. The former has many advantages with scarcely a disadvantage; the converse of this applied to layering is the truth. Nor does grafting, as "J. R." insists, dwarf the Rhododendron in any appreciable degree, if the operation is well performed, and the stock judiciously chosen. *Standish and Noble.*

Home Correspondence.

Consumption of Fuel in the Royal Botanic Gardens, Kew.—Messrs. John Weeks and Co. having written to inform me that I have, though they candidly allow unintentionally, misquoted their words in my communication to the last number of the *Chronicle*, I find, to my regret, that I have so done: or, rather, I misunderstood the drift of the sentence in question. My words were, that Messrs. Weeks's object is to prove "the extraordinary efficiency and economy of their heating apparatus," and that "in their establishment at Chelsea it does more work with one boiler than is done by 12 boilers in the Great Palm-house at the Royal Gardens of Kew." Messrs. Weeks' expression is "The extraordinary efficiency and economy of the heating apparatus will perhaps be better understood by the following comparison of the work it does in Messrs. Weeks' establishment by one boiler, and the work done by 12 boilers at the Great Palm-house at the Royal Gardens of Kew." This error, however, on my part does not in the slightest degree affect the rest of, and indeed the main, statements. *W. J. Hooker, R. B. G. Kew, Feb.* 13.

Winter Figs.—If Mr. Barron will kindly state what kind of Fig it is which has proved so productive with him through the winter months in a Pine stove, as is mentioned at p. 86, he will greatly oblige *A Subscriber.*

Water Filter.—An effectual yet simple filter may be made in a cistern of slate, or brick and cement having two slate partitions across it, one of them, near the end where the water enters, being fixed with an aperture of a few inches between its lower edge and the bottom of the box, so that the water in filtering shall pass under it. The other partition should fit close to the bottom of the box, but its upper edge should be a few inches lower than the top, in order that the water may flow over it. The box will thus be divided into three compartments—into the first the water should enter by means of a ball tap, and stand high enough to flow through the second compartment into the third, from which the clear water may be drawn off by means of a tap near the bottom. The first and second compartments should be filled about half-full with coarse charcoal, and over it a few inches of a finer size, and afterwards surfaced in the first compartment with some clean shingle, always leaving depth enough for the ball of the tap to work in. Over the charcoal in the second compartment some perfectly clean sand should be laid nearly as high as the top of the division. This filter will occasionally require cleaning out and refilling with fresh materials, the period for which will be indicated by the water passing more slowly through it than usual. If cheapness is more an object than durability a water-tight wooden cistern may be used; but avoid lead linings, which are dangerous. *W. Davidson, Landscape Gardener and Garden Architect, 37, Bloomsbury Street.*

Wash for Fruit Trees.—I have found the following a certain antidote for insects, or fungus, on Vines and fruit trees:—1 lb. sulphur, 2 lbs. soft soap, 1 gallon tobacco water, and 2 gallons lime water; mix. To paint over all the wood. *W. Collins, M.R.C.S., Drewsteington.*

Consumption of Fuel in the Royal Botanic Gardens, Kew.—Under the above head there appeared in your columns of last week a statement by Sir William J. Hooker contradicting those contained in our advertisements of the 29th December and 7th January last. Speaking of our advertisement, Sir William Hooker says it "is calculated to convey very erroneous notions of the consumption of fuel in our Palm-house; and, if true, showing us to be guilty of a most extravagant and unjustifiable use of the public money." In reply to this passage we shall merely observe that on seeing the *Gardeners' Chronicle* of the 10th inst., we immediately wrote to Sir William Hooker, saying—"Whatever inaccuracies we may have been led into by incorrect information, we shall feel it our duty to set right in the next publication of the *Gardeners' Chronicle;* and we lose not a moment in expressing our sincere regret that any statement of ours could be considered as conveying a charge against the management of the Royal Gardens at Kew, or the administration of the funds devoted to its support by the country," and that, had we done so, or "intended anything of the kind, we knew well the attempt could only recoil upon ourselves." It now rests with us to show upon what grounds our statement of the consumption of fuel at the Palm-house at Kew was made. With the view of avoiding "enormous errors and miscalculations," with which Sir William Hooker charges us, we proceeded to the Palm-house at Kew in December last, and there received from the two men who attend to the fires the items of the consumption of fuel as given in our advertisement. Our Mr. Weeks, as a practical man, went into the whole question of the heating of the Palm-house with both of the men, and saw no reason for supposing the information they gave him to be incorrect. Upon that information our calculation of the expense attending the consumption of fuel was based. Our advertisement containing that calculation having appeared first in the *Gardeners' Chronicle* so far back as the 29th December, and otherwise having been pretty extensively circulated without its accuracy having been called in question until the 10th inst., we had till then believed that our statement was at least free from exaggeration, more particularly as the information given us in December would have warranted us in making out a larger expenditure of fuel than we put down. Sir William Hooker's contradictions of our statements made it necessary that we should revisit the Palm-house, and therefore our Mr. Weeks, accompanied by another practical man, went there on the 12th inst., when they obtained the following information from the men who attend to the boilers in the Palm-house. The men said—"The house is heated by 12 boilers, six on each side; we bring every day from the depôt eight truck or cart loads of fuel, each cart load contains nine sacks, all of which is consumed during the 24 hours. The fuel consists of one half good coke, the other half good coals." This statement is corroborative of that made to Mr. Weeks, in December last, and it requires but a very simple calculation to see that, according to it, there are 72 sacks of the mixed fuel consumed every 24 hours. We estimate the coke at about 1*s.* 2*d.* per sack, and the coals at about 2*s.* 6*d.* per sack, and at these prices, the mixed fuel would cost about 1*s.* 10*d.* per sack, which would make the daily consumption of fuel to heat the Palm-house amount to about 6*l.* 12*s.* per day. We were further told on the spot that this quantity of fuel was required for nearly six months each year; but, in our calculations, we estimated the largest expenditure of fuel for four months only, and if we now assume that 72 sacks of mixed fuel, as stated to us by the men attending the boilers, is correct, but that that consumption is limited to four months instead of six, or nearly so, it would amount to £792 0 0

If we then reduce the consumption for the next four months, say by one-third, we find the expenditure amounts to 528 0 0

And say half that again for the four summer months 264 0 0

Making the annual consumption of fuel for heating the Palm-house amount to 1584 0 0

We have now stated where we obtained our information, and how we have made our calculations, and can only say, that if we are guilty of "enormous errors and miscalculations," we hope Sir William Hooker will think as we did, that it was very natural we should have placed credence in the statements made to us on the spot by the very men who supply the furnaces daily with fuel, who being perfect strangers to us, had, we imagine, no reason whatever in deceiving us with false information on two separate occasions. Sir William in his statement observes, "that the object of Messrs. Weeks (referring to our advertisement) is to prove the extraordinary efficiency and economy of their heating apparatus," and that, at our establishment at Chelsea, "it does more work with one boiler than is done by 12 boilers in the great Palm-house at the Royal Gardens of Kew." This, we must respectfully observe, is a misquotation: our statement was, and we see no reason whatever for altering it, that "the apparatus of Messrs. Weeks with one boiler is doing about as much work as *four* boilers do in the Kew Palm-house;" and that "the great Palm-house at Kew could be heated at a cost in labour and fuel of 14*s.* 8*d.* per day," and we are still of opinion that we are not far wrong. Again, Sir William Hooker says, "we will grant that they (meaning Messrs. Weeks) expend only 14*s.* 8*d.* per day during the winter months in their nursery establishment for fuel and labour." Now, we made no such statement. We repeat that we heat the whole of our nursery with one boiler, and that, in fuel and labour, we do not expend more than 3*s.* 8*d.* per day. During our visit to the Palm-house on the 12th inst., we perceived that the 12 boilers, and they certainly were well supplied with fuel, only got the temperature up to 60°; now, our one boiler, circulating the water through 5000 feet of pipe, will give us not less than 60° in any of our houses and pits, whilst the hothouses will have a temperature of between 70° and 80°. Sir William Hooker, in his concluding observations, asks, "How a business man like Mr. Weeks could have fallen into such enormous errors and miscalculations," and "how he (Mr. Weeks) can

[illegible] us with such a gross misapplication of public money, I must leave that gentleman to settle in his own mind." On this we must remark that we sincerely hope Sir William Hooker is the only person who has so interpreted any passage in our advertisement, [illegible] we are unable ourselves to put that construction upon [illegible] we have written. No doubt it was intended to be as [illegible] possible in heating the great Palm-house; and, no [illegible] fuel more than necessary is or has ever been [illegible]: but still it may be quite possible that, with [illegible] boilers than those in use in the Kew Palm-[illegible] a far greater economy of fuel might be obtained than Sir William Hooker has any idea of. This is all we ever said or [illegible], and we fully trust this explanation may be satisfactory to Sir William Hooker as respects the true meaning of our previous statement, although we must confess that our [illegible] to discover, from the firemen at the Palm-house, where or how we had been led into error by what they told us in [illegible] have been unavailing; and how to explain the great difference between the statement of Sir William Hooker that the cost of heating the Palm-house "can in no way be calculated to average more than 300*l.* a year," and the statement of the firemen that "the 12 boilers consume 72 sacks of mixed fuel each 24 hours," is certainly more than we can pretend to do. *John Weeks & Co. King's Road, Chelsea.*

Societies.

Linnean, *Feb.* 6.—The President in the chair. W. F. Daniell, M.D., and W. Gourlie, Esq., jun., were elected Fellows. Mr. J. O. Westwood made some observations on the Eria silkworm, and on the attempts which have been recently made to introduce it into Malta, Algeria, and the South of Europe. Read:—The commencement of an elaborate memoir "on the structure and affinities of the natural order Balanophoreæ," by Dr. J. D. Hooker. This memoir was illustrated by an extensive series of admirable drawings. The author stated he had examined about 30 species of the order from various sources, and of 26 of these, both sexes. The simplest and most frequent form assumed by the rhizome or axis of these curious plants was stated to be that of a simple or branched tuber, sessile on the root from which it derives its nourishment, and giving off one or more flower-bearing peduncles. "In the earliest stage," the author observes, "at which I have examined any of the Helosidæ or Balanophoreæ, the young plants appear as a cellular mass, nidulating in the bark of the root (but partially exposed) with whose cellular tissue its own is in organic adhesion, though easily distinguishable. It offers at first no trace of a vascular system, nor any distinction of parts; but before it has reached the cambium layer of the bark, and before its upper extremity has attained any considerable size, an opaque line of white cellular tissue, different from the red, may be found beneath each lobe, or in the centre of the mass, in which vascular tissue makes its appearance. Shortly afterwards, the wood of the root upon which the parasite grows appears to become affected; its annual layers are displaced, and, at a still later period, vascular bundles enclosed in a cellular sheath appear to have ascended into the axis of the rhizome, and to have become continuous with those already found in it. Some genera do not present the appearance of receiving any vascular bundles directly from the root-stock, but their own vascular bundles may be traced descending to the line of union between the root and the parasite, where they become closely applied to the vascular system of the former without, however, forming any interlacement or organic union."—"The rhizomes in many species attain a considerable age. Helosis seems to be capable of indefinite increase, the individual patches of the plant flowering at all or most seasons of the year, and the old branches of the rhizome dying away as new ones are formed." Phyllocoryne also, as well as Rhopalocnemis, several species of Balanophora, Lepidophyton, Langsdorffia, and Sarcophyte, are perennial; Cynomorium, it was observed, seems decidedly annual. In no case is the vegetation of the rhizome very rapid in comparison with that of many plants, especially of fungi, with which some persons have compared the Balanophoreæ. On the contrary, Dr. Hooker believes that the growth of all the parts is very slow; and, with regard to Rhopalocnemis and Balanophora especially, many opportunities had been afforded him of observing that the peduncle did not flower for several weeks after its protusion from the rhizome. The memoir, which scarcely admits of abstract, goes on to detail minutely the peculiarities which were observed in an examination of the tissues of the plants; and the author then traces the development of their foliar organs, their inflorescence, their flowers, stamens, ovaries, and ovules, and their seeds; passing under review the various opinions which have been published by other observers, as to the nature of the parts composing these several organs.

Notices of Books.

Mountains and Molehills, or Recollections of a Burnt Journal. By Frank Marryat. 8vo, Longmans.

Mr. Marryat is a great draughtsman—not with the pencil, we own—but with the pen. His sketches of Californian society and scenery, his own adventures and the adventures of his friends, are told in a joyous spirit and a Saxon style which captivates the idle and arrests the attention of the earnest reader. Those who think of going to California may here learn the truth of what they must expect; those who have friends there will learn the way in which their lives are spent; those who have an itching for speculation there may judge of their chances by the author's opinion as to the value of Californian evidence manufactured for the European market. Through the dashing style of the writer we have no difficulty in discovering him to be a science-hater; but we like him none the less for that, though we should like him better were he otherwise. The charm of his book is its freedom from all conventionality; the author wears neither white kid gloves nor glazed boots—at least in California—but appears in the rough dress of a trapper or squatter, or wild hunter, of which his book is but the reflection. Can we say more in his favour? The following extracts will show the reader what he has to expect in Mr. Frank Marryat's burnt journal.

"There are few after all to whom either roughness or adventurous life comes aptly, although the proud man scorns to own he feels the privation he has sought as it were; but few of those who have sacrified position, comforts, and friends elsewhere, for the pursuit of freedom and adventure, with wealth of course appearing in the distance, have realised their dreams, or have done otherwise in the long run than own their folly, and mourn it secretly. Some men are born for a wild and careless life—a happy liveliness of disposition, knowledge of the world, physical health, recklessness of personal safety, indifference to social position and home comfort, all fit them for it; their creed is to do as no one else does (and they do none the worse for this); these men are few in number, and they can live when others starve. Observe the man in a hunting-field, who strikes out his own line of country, and that a new one to him; each fence may conceal a marl-pit, but he faces bravely all obstacles, and comes in right at last. Rash fool! says Jones as he opens a gate. Stupid ass! echoes Brown as he creeps through a gap. But no! Brown and Jones would be both fools and asses if they tried to do it, but to this man such work comes naturally.

"As a rule the fate of the minnows who will pursue an unbeaten track is certain enough. It is generally a great mistake when men throw up on their own account a certain means of livelihood, to seek adventure and fortune in new gold countries. It is generally a great mistake when fathers with spendthrift sons, stupid sons, or lazy sons, say, 'John, you are doing no good for yourself; here are 500*l.*; go and try your luck in the diggings.' It was a great mistake when a party of gentlemen left England in 1849 for California in a yacht of their own, and having arrived at the diggings got disgusted, and returned very much out at elbows, with most melancholy reports respecting the gold-fields. And these are great mistakes, for this reason, that patience under disappointment, and a disposition that can ever look sanguinely into the future, are as requisite for 'rough life,' as strong hands, willing hearts, and sound health.

"Our entertainers occupied themselves in market-gardening, which is a peaceful and unexciting profession; and as the whole party were animated with a strong love of adventure, and were anxious for something more soul-stirring than weeding and watering beds of Cabbages, soon after I last saw them they disbanded and dispersed, nor have I heard of them since. Vegetables attain an unusual size in California, owing to the rich qualities of the maiden soil; but I have observed an insipidity in everything that has thus rapidly matured, and size is attained at the expense of loss of flavour. Onions and Tomatas as large as cheese plates are common. Melons have attained the weight of 50 pounds. Wheat and Oats grow to the height of 8 and 10 feet, and are very prolific in the ear; Potatoes reach dimensions unheard of elsewhere, and the diameter of a Cabbage is sometimes so large that the Cabbage has to be seen to be believed in."

"We stopped to breakfast at a house of entertainment kept by one Crockett, who had a very pretty wife; but the possession of this luxury, so far from humanising Crockett, appeared to keep him in a continual fever of irritation; for he was jealous, poor fellow, and used to worry himself because there was ever a dozen or two of hairy miners gazing in a bewildered manner at Mrs. C.; but, if report speaks truly, the bonnet and boots of a 'female' had been successfully exhibited in this region at a dollar a head (a glimpse of them being thought cheap even at that price): surely therefore Crockett might have excused the poor miners for regarding attentively the original article when presented gratis in the shape of a pretty woman.

"Crockett carried a revolver of disproportionate size, he not being a large man, and this instrument he occasionally used upon provocation. A great number of miners had looked at Mrs. Crockett on the morning of our arrival, and her husband had not quite finished foaming at the mouth in consequence, when we entered the house. It was some time before he condescended to be civil; but having at length informed us that he was 'so riled that his skin cracked,' he added that he was a 'devilish good fellow when he was right side up,' and commanded us to drink with him. After this he procured us a most excellent breakfast, and, on the strength of our respectable appearance, allowed Mrs. Crockett to preside at this repast, which she did in a nervous manner, as if momentarily under the expectation of being shot.

"We left our host 'right side up,' and proceeding on our way, we soon lost sight of the cultivated country, and began to traverse undulating plains studded with the dwarf Oak. The road now gradually becomes worse, and has long ceased to be level; we pass road-side houses, whose names indicate the localities in which they are placed: 'Rolling Hills,' 'Willow Springs,' 'Red Mountain,' and so forth. After travelling 20 miles we ascend the first range of hills; the Pine-tree appears, and here and there we catch glimpses of the American Fork river. As we leave the plain and ascend the wooded hills, trails may be observed indicated by blazed trees, leading to mountain gorges, where diggers are at work. Flowers clothe the hills in the richest profusion, and most conspicuous is the yellow Poppy, which lightens up these desolate red hills for a few weeks each spring; growing in rich masses that, in contrast to the bleak and stunted herbage, are like sunbeams, and like sunbeams leave every spot they cheer more gloomy, when, under the influence of the first hot summer wind, they droop in a night and pass away."

Miss Corner's Familiar Fables (Dean & Son) is a handsome volume, beautifully printed and profusely illustrated by clever woodcuts. It is a charming present for little folks.

Garden Memoranda.

Messrs. Fraser's, Lea Bridge Road, Essex.—Since we last visited this nursery several new glass-houses have been erected, and among them a span-roofed show-house, about 65 feet in length, and 21 feet in width. This, even thus early in the season, is as gay as it well could be with forced flowers, more especially with Azaleas, which, when well bloomed, as these were, could not possibly be surpassed in brilliancy. Among them were Old White and Fielder's White, the latter doubtless a variety of the former, but an improvement on it, especially in regard to foliage, which it keeps better in winter than the Old White. Associated with these were also Smith's coccinea, which is one of the best red Azaleas for early work, exquisita and one or two semi-double sorts. It has been found that the latter keep much longer in blossom than the single kinds, a fact worth remembering by all who are desirous of having a long continuance of gay flowers. Some Camellias and a rose-coloured Rhododendron, called Cunninghami, also helped to decorate this house. This variety of Rhododendron comes regularly into flower at this season without any forcing. On the side shelves were Crocuses, Hyacinths, early Tulips, Narcissi, and Chinese Primulas, arranged in rows, and so placed in regard to colour as to render them very effective. It may not be out of place here to remark that bulbs generally are blooming unusually well this year—scarcely a single failure occurring among them. The Primulas mentioned above were single kinds, and were all raised from seeds sown in June last.

In another house was a collection of all the finer varieties of tree Carnations, which, if assisted with a little heat, keep on blooming all through the winter and spring. We need not say that they are invaluable for cutting from, which does them more good than harm, for whenever they are cut they throw out new shoots, and thus keep up a continuous supply of flowers.

In the Heath house some of the early kinds, as Grandinosa, Vernix coccinea, which produces pretty little round orange globular flowers, ardens, and others were in blossom. The two latter do not strike readily from cuttings; but this is little to be regretted as they come plentifully from seeds, which they ripen in abundance. Among Leschenaultias in another division of the same house, were Baxteri and its large variety, which is perhaps the best of all of them for making a good display in winter; also a kind called intermedia, which has the good quality of keeping well in winter, which formosa, which is one of its parents (the other being Baxteri), does not.

It may interest some to know that the Messrs. Fraser have commenced to grow Pelargoniums on an extensive scale. They have already several houses full of young plants, both fancies and others, and a large span-roofed show-house has been erected for specimen plants. We may, therefore, look forward to seeing our metropolitan exhibitions enriched next season by collections of well-grown Pelargoniums from Lea Bridge.

In stoves some of the best specimens of Ixoras, Allamandas, and Dipladenias were being trained, and put in good condition for summer; and, in order to assist them to make fine growth, their pots were being plunged in tan. In one of these houses we noticed some tops of Poinsettia pulcherrima in 3-inch pots with noble heads of scarlet leaves, though the plants themselves were not more than 6 inches in height. These were struck last autumn, and it has been found here, as elsewhere, that plants got up annually in that way are greatly to be preferred to older ones, the floral leaves on the latter not being nearly so large as those on young plants.

In the specimen houses there was a great number of the best kinds of Azaleas, Ericas, and other hard-wooded plants, varying in size from 1 to 6 feet in height, and all beautifully furnished with flower-buds. Among them was a Franciscea, not a very common plant in a cool-house in winter; but Messrs. Fraser have found that Francisceas wintered in greenhouse temperature flower better than those kept in a stove, provided the wood has been well ripened early the previous autumn.

In an intermediate house some of Mr. Fortune's Azaleas were in flower, among which were the pretty little purple-blossomed amœna, the striped variety called Fortuni, vittata punctata, and one or two others. Here were also several pots of fringed double white Primulas and some Hollyhocks, which, when potted and encouraged with a little heat as these were, throw up young shoots, which make good cuttings. This, therefore, is a quick

way of increasing these plants, of which one can scarcely have too many.

Of Camellias, of which there is a large houseful here, some of the early kinds were in blossom, and among them were Donckelaari in fine condition, the blooms being large and beautifully mottled; Lady Hume's Blush, the Double Striped, Marchioness of Exeter, and Chandleri, which is still one of the best reds. Out of doors, we need scarcely say there was nothing in blossom except Jasminum nudiflorum, which struggles hard to open its flowers, even amongst the frost and snow; it is only, however, on a very sheltered wall or under glass that they can be seen to advantage.

FLORICULTURE.

Brompton and other Stocks.—In many cases the most beautiful of all the kinds of Stocks, the Bromptons, get killed by the severity of the winter; but this is often avoided, in a portion at least of the quantity grown, by taking up the plants before winter and potting them, or by planting them in a spare Melon pit or cold frame, and afterwards replanting them in the open ground in spring, but they never flower so well, or grow so large as when they survive the winter in the open border. When they have been planted under a wall or other shelter, and sufficiently protected by straw, fern, or similar material, they must be gradually uncovered as soon as this severe weather changes; and when it is judged safe to uncover them entirely, the ground about them may be stirred over, and top-dressed with some rich mould if necessary; watering freely with liquid manure if the weather admits of it. The plants in frames also, as soon as they begin to grow, should have plenty of air, and on very fine days the lights may be entirely removed, watering frequently with manure water or surfacing with rotten dung. When the plants begin to show for bloom the single ones may as well be pulled out, leaving only those that are double; these plants will flower in April and May. For a succession to flower from the middle of July until September, sow the various kinds of 10 weeks in the open border in very rich soil, about the middle of March, and thin out the strongest plants at first, and afterwards all the single ones as they show bloom (unless you want them for seed), and by the end of July you may have nothing but a bed of double Stocks. By transplanting some of the smaller plants about the end of May into very rich soil, a later succession of bloom may be obtained; if some purple and white Queen Stocks are sown at the same time and similarly treated they will commence flowering in August, and remain in beauty until they are destroyed by winter weather. If the winter should be mild, however, these plants will often keep on blooming until the Brompton Stocks sown in July take their place, thus producing a succession of bloom all the year round. In saving the seed of Stocks, as well as of all highly improved plants annually reproduced in this way, much depends on the care taken in selecting the plants from which to save seed. Choose always those with brightest and clearest colours, broadest petals, closest flower-spike, most numerous side branches, and dwarfest habit, and avoid all those plants with few lateral branches, robust habit, thinly set flower-spikes, and broken colours. Much also depends on the season, for if the summer should prove a very dry and warm one, the seeds will be much better as regards the production of double flowers; while, on the contrary, if the summer should prove to be cold and wet, a greater proportion of the plants will be single, and this accounts for the German seed being always superior to that saved in England. The bottom flowers on the spike only should be allowed to produce seed; and it is also a received fact that those blossoms of the single Stock which are strictly cruciform—that is, having only four petals—produce a much larger proportion of single blooming plants than those which have five, six, or more petals. Now most single Stock plants produce some flowers in this way, and the more in consequence of good treatment. It is advisable therefore to pinch off all the four-petalled blossoms as soon as they open, not only that no seed may be saved from them, but also that their pollen may not be scattered upon the slightly semi-double flowers. Finally, the best seed is obtained where large quantities are grown, and where the plants are allowed to remain when grown, and treated as above stated. It should also be observed that the seed of each colour and kind of Stock should be saved at as great a distance from the other as possible; in fact they should not be grown in the same parish. It is an antiquated notion that a plant with single flowers surrounded by double ones must produce seed from which nearly all the produce will be double, but such is not the case, for the perfectly double flowers have no effect upon the single ones, but merely indicate that the breed is a good one. *D.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—In houses where an average temperature of 45° is maintained, many of the planted out things will soon be showing indications of growth, and the soil should be examined, giving a good soaking or two, as may be found necessary, of tepid water where the border is found dry. It is advisable, however, to retard the growth of most things for some time yet, especially while the weather does not admit of giving air freely; but where this cannot be done, see that the soil about the roots is in a moist healthy state; for except this is attended to, anything like close vigorous growth need hardly be expected. Also remove as much of the surface soil from about old specimens as can be done without injuring the roots, and replace it with some good rich fresh material. See that every plant is clear of insects before growth commences; for success need hardly be expected unless these pests are kept under, and they are much more easily eradicated, and with less risk of injuring the plants before growth commences than after. Use fire-heat as sparingly as the state of the weather will admit, and moisten the surface of the borders occasionally, so as to counteract its drying effects; for the long continuance of frosty weather, and the consequent large use of fire-heat will be injurious to many things unless great care is exercised to keep the atmosphere in a soft moist state. Get a good stock of all requisites for potting prepared, and see to having plenty of peat and loam under cover, where it will be dry and fit for use at any time when it may be wanted.

FORCING DEPARTMENT.

Vineries.—Very careful management will be necessary in the present state of the weather, where the Vines are in an advanced state or fairly started, and care must be exercised to counteract the drying effects of so much fire-heat by means of the evaporating pans, and sprinkling the floors, &c. See that inside borders are not allowed to become too dry, and give a good soaking of tepid manure water in a weak state where it is found necessary. Look at last week's directions, and use fire-heat as sparingly as may be safe under the state of the Vines, &c. Figs.—Stop the young shoots regularly before the fourth or fifth leaf, and keep them regular and sufficiently thin to admit light and air, so as to get the wood matured, and secure a second crop. Where the trees incline to grow too luxuriantly, keep them rather sparingly supplied with water at the root, giving no more than may be absolutely necessary for the present crop, for unless short-jointed firm wood can be obtained, there will be little chance of obtaining an abundant second crop. Cucumbers.—There is no doing any good with these without the command of a brisk, moist, temperature, which should average 70° at night, and 75° to 85° by day, according to the state of the weather. Sprinkle the foliage frequently with the syringe, and keep the soil in a nice healthy state as to moisture, giving clear tepid weak manure water, also keep the shoots thin and regular, and trained near the glass, so as to expose every part to all the light possible. Take every opportunity of admitting fresh air, but do this very cautiously, for cold draughts would ruin the foliage. Where Melons are wanted early in June, seed of some known good early sort should be got in without further delay, and the young plants should be kept near the glass from the moment they appear above the soil, admitting a little fresh air on every favourable opportunity, with the view of getting strong short-jointed plants, which afford a much better chance of success than long-jointed weakly plants. Ridge out early plants as soon as they are sufficiently strong, and before they sustain any check by being confined in pots; but see that there is a nice regular bottom-heat of about 85° before committing the plants to the hills, and that the soil is in a healthy state as to moisture.

FLOWER GARDEN AND SHRUBBERIES.

The arrangement of the beds for the coming season should be decided upon at once if not already done, and gardeners who may not be thoroughly acquainted with the taste of their employers in this matter should provide a plan coloured as it may be intended to plant the beds, making whatever alterations may be suggested until the arrangement is as satisfactory to the family as the stock of plants at his command will admit of making it. This done it will be possible to concentrate attention upon the propagation of the stock which will be wanted, and to avoid occupying space, &c., in getting up useless things. And it is hardly of less importance that should the arrangement of the colours not prove quite satisfactory the blame will not fall altogether upon the gardener, and this will fully compensate for the trouble of preparing a plan, &c. Those who have to contend with a stiff soil will do well to dig spare beds lightly when the surface is frozen two or three inches deep, which will bring up and expose a further portion of the soil to the action of the atmosphere. The work of propagation will now demand constant attention, for it is of the utmost importance to forward this work as speedily as possible. Having ascertained what plants will be wanted, every cutting which can be procured should be got in at once, giving primary attention to such things as are known to be longest in becoming established plants; and if cuttings can be obtained put in sufficient to allow for failures, and having a small surplus stock at turning out time. It is quite possible to root cuttings of most bedding-out things, and to have them ready by planting out time if they are not put in for some time yet; but plants hastily got up and suddenly checked in their growth, as is necessarily the case when propagation is deferred till late in spring, make a poor figure in the beds for a long time after planting out, and are sometimes hardly got round in time to cover the ground before being cut off by the autumn frosts. It is therefore of the greatest importance to get the cuttings rooted early, so as to allow of having them strong plants without having occasion to grow them up to planting out time in a high moist temperature.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON
For the week ending Feb. 15, 1855, as observed at the Horticultural Gardens.

Feb.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth 1 foot deep.	Temperature. Of the Earth 2 feet deep	Wind

Satur. 24	46.9	34.4	40.7	15	0.29	3	2	2	3	4	[illegible]	[illegible]	[illegible]

The highest temperature during the above period occurred on the [illegible] 1846—therm. 59 deg.; and the lowest on the 20th, 1852—therm 15 deg.

Notices to Correspondents.

Anacharis: *Hydrocharad.* We believe there is a paper, pamphlet, or a communication to some Botanical Society, in addition to the notices you mention. We have not heard of it in American papers. In fact, in the rapid rivers of that country it is unimportant. It is in our sluggish streams that it is so formidable.

Books: *Diss.* You see how seldom we can meet your wishes. Booksellers do not mark the price on their publications, and therefore we cannot give it. We always do, when we are enabled.

Cucumbers, &c. *J W R.* Hot-water is better than dung-heat for growing these during winter and early spring. Your other question next week. ‡

Figs: *J R.* Such a letter is inadmissible, and ought not to have been written.

Garden Memoranda: *T G, Sheffield.* We are obliged to you for your letter, but we never publish matter of the kind without knowledge of the writer.

Gardeners Arms: *J S T.* Apply to the Secretary of the Society of Gardeners in Moorgate.

Grapes: *Z L* will be obliged by some of our correspondents informing him whether the Barbarossa has been tried as an early Grape, *i. e.*, whether it will force with the Black Hamburgh, and is equal to that variety as a cropper? He also adds, "Will what appears to be its greatest recommendation, viz., to hang without shrivelling, hold good in the summer months?"

Heather: *Mc H.* It is difficult to manage. Transplant small young plants in the beginning of September, watering the ground well, and shading them by throwing straw or fern, or some such substance lightly over them.

Heating: *W.* It does not answer to use steam for heating garden buildings. Water somewhere below the boiling point is universally preferred. Our opinion of the other method is unchanged: but there are *great* practical difficulties to overcome, and this has caused it to be laid aside. Your connecting pipes should be larger, not smaller, than the others. Until your 7-8th connecting pipes are altered, you cannot succeed. —*W P H.* Nothing is easier; only keep your boiler below the level of the lowest pipes. Zinc pipes don't answer. Use 4-inch iron spigot and fosset pipes; the others buckle, collapse, and break.

Names of Fruits: *H G B.* Your Apple appears to be Dumelow's Seedling. ‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*D O.* Lycaste fulvescens.

Paint for Iron Hurdles. We know of no better paint for these than that recommended by Mr. Fleming, of Trentham. It consists of two-thirds of Stockholm tar and one-third gas-tar mixed, and applied hot. A little fresh slaked quick-lime added to the boiling tar gives it greater consistency. ‡

Pinus: *Conifer.* It appears to be Pinus picea.

Quercus: *Diss.* When the frost goes you shall have from the garden of the Horticultural Society some plants of the real species, to which as F.H.S. you are entitled. If you send us full grown *leaves* of your Oaks next summer we will name them. That will be better than describing differences. The Black Italian Poplar is *monilifera;* how it came to be called Italian we do not know. It is a Canadian tree. What makes it valuable with you? To what purpose, except the flooring cottages and lofts, or fuel, do you apply it? Have you any demand for white wood for turners?

Stephanotis floribunda: *C C.* It will succeed tolerably well in the warmest part of the house you describe, if kept moderately dry in winter; but you must not expect it to flower so early as it would under stove treatment. A stout wooden box would be preferable to a pot in the position in which you propose placing it, viz., over the boiler; as the roots of the plant will be less exposed to change and extremes of temperature if the case containing them is formed of non-conducting material. The box should be raised sufficiently above the surface of the brick or stonework over the boiler to allow of the air passing freely underneath it. The best soil for the Stephanotis is fibrous loam and peat, enriched with leaf mould and well rotted manure. The box must be well drained, and the soil rendered sufficiently porous by mixing with it silver-sand and charcoal. ‡

Water Filter: *Sub.* You will find a description of one in another column, which may possibly answer your purpose. ‡

Wellingtonia gigantea: *The Big Un.* Seeds of this tree are scarce in England. If *you* have any, sow them at once in a mixture of loam and peat, in pans or shallow boxes, and place them in a mild greenhouse temperature. ‡

Misc.: *E. C.* Not oftener than once a fortnight or three weeks. We cannot find room. It seems to be Linum trigynum.—*Lover of Flowers.* Cold and damp have doubtless caused the flower buds of your Gardenias to drop off. Cuttings of Pimelea, if properly treated, ought to strike under the conditions you mention. The best cure for mildew is sulphur, which should be applied the moment the fungus makes its appearance. The question about the Daphne leaves will be answered next week.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PERUVIAN GUANO, of the finest description, on sale from a vessel now due, without any restrictions.—Apply to JOHN and THOMAS JOHNSON, Walmer Buildings, Water Street, Liverpool.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

WHEAT AND OTHER MANURES ON SALE.—The success attending the application of the manure especially adapted for Wheat during the last two years, induces the undersigned to again offer it to the Agriculturists with confidence. Also Superphosphate of Lime, Blood Manure, Guano, Nitrate of Soda, Gypsum, Salt, Peat Charcoal, and all other Manures of known value.—Apply for Prices Current to MARK FOTHERGILL & CO., 204A, Upper Thames Street, London.

THE MANCHESTER SEWAGE GUANO COMPANY respectfully inform Agriculturists that they have made arrangements which will enable them to meet the increasing demand for their Manures. The MANCHESTER SEWAGE GUANO is a compost of Blood, Bones, Urine, Nightsoil, and other Animal Matters, and highly fertilising Chemical Ingredients, which are in a concentrated state incorporated with Animal and Vegetable Charcoal, ground to a fine powder, *the whole forming a dry portable Manure.* It is free from all kinds of Seeds, Weeds, &c., and enriches the land to a considerable degree for several years after it is used. Price 5*l.* 5*s.* per ton. Net cash on delivery. Testimonials forwarded on application. Carriage free to any Railway or Canal Wharf in Manchester.—JOHN THOMPSON, Secretary, 3, Watling Street, Shudehill, Manchester.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

TREE TRANSPLANTING BY M'GLASHEN'S PATENT.
MR. M'GLASHEN is now prepared to supply Apparatus or give Estimates as to the rate at which he will safely and expeditiously transplant Trees or Shrubs of any dimensions in any part of the United Kingdom.
Canonmills Bridge, Edinburgh.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when Crushed will make two. Great saving.
OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1*s.*
M. WEDLAKE, 118, Fenchurch Street, London.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.
SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.
Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.
N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

WEEDS ON WALKS.
MR. FLEMING'S WEEDING OR SALTING MACHINE FOR GRAVEL WALKS, COURT YARDS, &c., manufactured and sold by ALEXANDER SHANKS & SON, Arbroath, Forfarshire, from whom particulars with prices may be had.

MAW'S ENCAUSTIC TILE PAVEMENTS form an indestructible and highly decorative substitute for ordinary flooring, and their imperishable Oil Cloth Coverings for Entrance Halls, Passages, Verandahs, Conservatories, &c.—MAW & Co. send free of expense their Book of Designs, suitable in price and style for every description of Building.—Benthall Works, Broseley, Salop.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.
"FRIGI DOMO," a Canvass made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey, and of all Nurserymen and Seedsmen throughout the kingdom.
"It is much cheaper than mats as a covering."

BARTON'S PATENT SAFETY STABLE FITTINGS, AND ENAMELLED MANGERS.

THE only Patented invention of this description constructed so as to prevent considerable waste of Hay and Corn, together with all the newest improvements.
NEWLY IMPROVED ECONOMIC STABLE FITTINGS, FORTY SHILLINGS PER SET, to fill up the whole width of Stalls, and can be had enamelled or galvanised. Every description of Mangers, Racks, and Stable Furniture in stock; Iron Hurdles, Gates, Fencing, &c.
Manufacturer of Kite's Patent Noiseless Cast-Iron Smoke-Curing Chimney Caps (200 on Buckingham Palace), price 35*s.* each. Price Lists and Illustrated Catalogues forwarded on receipt of two postage stamps.
JAMES BARTON, IRON FOUNDER, &c., 370, Oxford Street, few doors east of the Pantheon.

MANGER, RACK, & WATER-TROUGH AS ONE FIXTURE.
IMPROVED AND NEWLY PATENTED.

COTTAM AND HALLEN, the original inventors, obtained the Great Exhibition Prize Medal for this arrangement, to which all the latest improvements are adapted, secured by Patent, including a method entirely new of attaching the halter-weight and rein from the back of the manger to the under front of the plate, allowing the horse greater freedom, and being noiseless in operation, add much to its comfort whilst feeding and convenience when at rest, as likewise, from their position, avoiding the liability of the most restive horse getting cast. No well-managed stable should be without these fittings.
COTTAM'S ENAMELLED MANGERS are constructed in the best possible manner, both as to form and utility; are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, and Enamelled. Improved Surface Drain, with Safety Covers, Sanitary Traps, Stable Pumps, Loose Box, Fittings, Gutta Percha Preserving Saddle and Harness Brackets, and every article in Stable Furniture, in stock. An extensive assortment of Patterns for both Plain and Ornamental Castings, and every description of Wrought and Cast Iron Work for building and other purposes. Agricultural and Horticultural Implements, Iron Gates, both plain and ornamental, Hurdles, Strain Fencing, &c.
Estimates and Catalogues on application to COTTAM & HALLEN, 2, Winsley Street, Oxford Street.
WARMING AND VENTILATING.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

STEPHENSON AND PEILL, 61, Gracechurch Street London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

CHAFF-MACHINES AND CORN-CRUSHERS.—All these Machines exemplify, in the most satisfactory manner, the high degree of perfection to which RICHMOND AND CHANDLER have attained in the manufacture of Agricultural Implements; and the recent improvements made upon their various Chaff-Machines and Corn-Crushers (articles for the production of which this firm has long been justly celebrated) are of the highest value in the economical preparation of food for cattle.—Address RICHMOND & CHANDLER, Salford, Manchester and South John Street, Liverpool. Catalogues gratis.

WILLIAM DRAY AND CO.'S STEEL DIGGING FORKS are warranted equal, and by many are considered superior, to any in use. Three Tine Forks, 4*s.* 6*d.* each; Four Tine Forks, 5*s.* 6*d.* each. A liberal allowance on Wholesale Orders.
WILLIAM DRAY & Co., Swan Lane, Upper Thames Street, near London Bridge.

GUTTA PERCHA.
NOTICE IS HEREBY GIVEN that We, the undersigned, are the Sole Patentees and Proprietors of the principal patents for the manufacture of GUTTA PERCHA: That under the original patent (granted to our Mr. Charles Hancock, May 15th, 1844), was secured to us the exclusive right of manufacturing Gutta Percha Masticated, Gutta Percha Moulded, Gutta Percha in Sheets, Solution, &c.: That we have granted no licence for the manufacture of such articles thereunder: And that all parties who make, use, or vend the same, other than manufactured by us, and sold by us, or our Agents, and bearing our stamp, will be treated as infringers of our said rights.
N.B. All applications for licenses to work this or other of our patents must be addressed to us as below. A liberal discount to Shippers and Dealers.
THE WEST GUTTA PERCHA COMPANY, West Street, Smithfield, London. Manufacturers of all articles in Gutta Percha.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
John C. Cobbold, Esq., M.P. | William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S. | Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq. | Samuel Morton Peto, Esq.
Thomas Edward Dicey, Esq. | William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.
Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

The Agricultural Gazette.

SATURDAY, FEBRUARY 17, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, Feb. 21—Agricultural Society of England.

WE referred at page 60 to Mr. DENTON's pamphlet on LAND DRAINAGE * in terms characteristic of it generally as a valuable contribution to the literature of its important subject: and at the time last year when the greater part of it was read before the London Farmers' Club, a large portion of it was extracted and published in our columns.

Our present object in returning to the work is, therefore, merely to call attention to the facts which it relates in reference to the several Land Drainage Companies which are in operation. The usefulness of such associations is almost universally admitted. We say *almost*, because in Scotland, where one—the Lands Improvement Company—has power to operate, objections have been taken to loans for the improvement of land to be secured by a rent-charge preferable to all other burdens previously affecting the inheritance. Any measure, it is said,

* "Land Drainage and Drainage Systems," by J. BAILEY DENTON, F.G.S., &c. J. Ridgway, Piccadilly.

"calculated to interfere with the high character of Scottish heritable securities consequent on the system of record which there obtains, and the perfect security it affords, is to be condemned." The only question is whether a preferable claim for the return of advances for land drainage and, under judicious supervision, for the erection of farm buildings, will interfere with the security of other claims upon the property. We have confidence enough in the profitableness of agricultural improvements to believe that so far from this, they would increase the security of other creditors. The powers whose usefulness has been doubted, do, however, exist—happily so, as we believe—and it has been with great satisfaction, therefore, that we have pointed out in previous papers that these powers as possessed by the Lands Improvement Company are practically unlimited, as to the extent of such improvements, and the amount of capital required for their proper execution.

This, however, is the national aspect, rather than the individual, which the subject presents. When an individual proprietor looks round him for assistance from these companies, it is nothing to him that the powers of some among them are inexhaustible so long as he knows that the powers of none of them are, in point of fact, exhausted. It then becomes his business to compare them, and ascertain with which he can most cheaply and efficiently do business. This, of course, is a decision he must make himself. We shall not undertake the invidious task of determining the matter for him; but we can, perhaps, assist him by extracting from Mr. Denton's pamphlet the following information on the subject. We may mention, though it is unnecessary to do so, for his statement is purely historical—an impartial relation of mere matters of fact—that Mr. Denton is an office bearer in the General Land Drainage and Improvement Company.

"Owners of settled properties have the choice of several means of charging the cost of draining upon the inheritance, and through each medium they can either borrow the money to be expended, or they can apply their own private funds to the object, and take a rent-charge on their estates for the repayment, in which latter instance they will retain personal power over the disposal of money expended, and can leave to whom they please the rent-charge payable by their successor.

"The means referred to are the *Private Moneys Drainage Act* (12 & 13 Vict. cap. c.) limited to draining only.

"The West of England or South West Land Draining Company's Act (11 & 12 Vict. cap. cxlii.), for the purposes of

Draining	Embanking, reclaiming, and enclosing.
Irrigation and warping.	Road-making.

"The General Land Drainage and Improvement Company's Act (12 & 13 Vict. cap. xci.), for the purposes of

Draining	Embanking, reclaiming, and enclosing.
Irrigating and warping.	Road-making.
Erecting farm buildings.	

"And the Lands Improvement Company's Act (16 & 17 Vict. cap. clv.), for the purposes of

Draining.	Clearing lands.
Irrigating and warping	Erecting farm buildings.
Embanking, reclaiming, and enclosing.	Road-making, and planting for shelter.

"The terms of years over which these several Acts of Parliament enable landowners to extend the repayment by equal annual instalments of the amount expended, as well as the annual amount by which the repayment is effected, may be thus compared:—

	Period over which the Repayment may extend.	Proportion of Amount expended to be charged.	Annual Instalment or Rent-charge.
Private Moneys Drainage Act. Draining	22 years	All	From 6*l.* 10*s.* 1*d.* to 7*l.* 10*s.* 11*d.* Present charge, 7*l.* 5*s.* 1*d.*
West of England Company's Act. Draining, Irrigation and Warping, Embanking, Reclaiming, and Enclosing, Road-making	In perpetuity	All	According to the prevailing value of money. Present value, 4½ to 5 p. ct.
General Land Drainage and Improvement Company's Act. Draining, Irrigation and Warping, Embanking, Reclaiming, and Enclosing, Road-making, Farm-buildings	50 years	All	£5 2 10
The Lands Improvement Company's Act. Draining	31 years	All	£6 3 2
Irrigation and Warping, Embanking, Reclaiming, and Enclosing, Clearing Lands	25 years	All	From £6 10 8 minim. to £7 11 0 max.
Farm-buildings	...	¾ of Cost	£6 15 0 is the present charge
Road-making, Planting for Shelter	...	½ of Cost	

"Under either of these acts a landowner may charge his estate; but it is by arrangement with either of the moneyed companies that he can borrow capital for the work, unless he calls to his aid a third party (a banker or an insurance office, for instance), and then he can put in motion the Private Moneys Drainage Act, and avoid the commission charged by the companies.

"From experience, however, already gained in the working of these several acts, it is found that the legal expenses attending the Private Moneys Act, and the higher rate of interest required by private bankers on single transactions of the kind, together with the risk and responsibility attached to the works, and of charging the estate, far outbalances the commission required by the trading companies, who are enabled by extensive dealings to effect the monetary arrangements much more easily and cheaply than an individual landowner, and without any examination of titles, and notice to mortgagees, except in the case of the Lands Improvement Company."

In addition to this, we may remark that the West of England Drainage Company is stated to be an *operative* company only. The General Land Drainage Company is not only this, but it provides money to the landowner who has executed approved works. The Lands Improvement Company, again, though it employs a staff of superintending officers, has not hitherto acted as an operative company directly, but provides money to landowners who have executed authorised and approved works.

There is ample room for all these companies, and all of them are in efficient operation. The smallest of them, as we must suppose, from its provincial character, the West of England Company to be, has drained during the following years the following acres:—

1849	...	1266 acres.	1852	...	3910 acres.
1850	...	1649 „	1853	...	4234 „
1851	...	3365 „	1854	...	5921 „

It has drained in almost every county in England, and is at present at work in 15 counties. It has now, remaining to be done under contracts entered into, 26,800 acres, and the number of hands in daily employment is above 950. It has the exclusive power of charging its improvements in perpetuity upon the land, so that the owners of a limited interest in the land are able, for the mere interest of money spent, to effect its permanent improvement.

The General Land Drainage Company drained 6300 acres in 1854, and executed roads and buildings of the value of 35,000*l.* During the draining season they have had a permanent staff of 1500 men in their employment, and have large works now on hand; one contract alone being for 42,000*l.*

The Lands Improvement Company is the youngest of the number, and in some respects, as we have shown, exceeds them all in the unlimited character of its powers. It too is, as might be expected, already in extensive connection with landed improvements throughout the country—indeed we have been told that already during the short period of its existence it has transacted business to the extent of 200,000*l.*; and that there is scope for it and for many other agencies, whether for providing capital or seeing to its efficient application to the land, no man can doubt.

In acknowledging the receipt of THE AGRICULTURAL RETURNS FROM SCOTLAND, given by the public spirit of Scottish agriculturists, and gathered by the energy of Mr. MAXWELL, the Board of Trade paid a well-merited compliment to the Highland Society and its secretary, for their services in conducting "this interesting but most laborious experiment to its successful issue." Their letter proceeds as follow:—

"At the same time, my lords feel that had it not been for the cordial co-operation of the whole body of Scotch farmers, even the energy displayed in the conduct of the experiment by the Highland Society would necessarily have been unrewarded by success, and they are anxious to place on record their testimony to the intelligence and public spirit of the agriculturists of Scotland, in thus coming forward to promote a great national undertaking."

At the meeting of the Highland Society last week, Mr. FINNIE, tenant of Swanstone, near Edinburgh, acknowledged this compliment in the following terms, which we publish here, as being in striking contrast to the spirit in which the subject has been regarded by many in the south. Mr. FINNIE is well known in Scotland as one of the most intelligent and enterprising of his class; and that he was qualified really, as well as by position, to be their spokesman, the following proves. He spoke as follows:—

"Having acted as one of the enumerators for the county of Edinburgh, I will, with your permission, embrace this opportunity of expressing, on behalf of the farmers of Scotland, our sincere gratification that the information obtained from our body is so likely to serve the purposes for which the agricultural statistics inquiry was instituted, and also that the hearty co-operation we gave, in the absence of all legal pressure, throughout the prosecution of this important experiment, has been so fully appreciated. I may, at the same time, on the part of my brother farmers, with confidence assure Government, through Mr. Hall Maxwell, that if, hitherto, we have contributed in bringing to a successful issue an inquiry which embraced the whole of Scotland, within the limited period of one year, such may be a sufficient guarantee that, hereafter, in connection with agricultural statistics, our endeavours shall be to afford a still more perfect knowledge of whatever the Legislature may consider advantageous, in order to meet the requirements of the general community. Much has been said and written about the state of agriculture throughout the world, and it would ill become me, a Scotch farmer, to stand here and eulogise that class to which I belong; but this I may say, without the fear of contradiction, that, with all our defects, the art we practise has been progressing, and not remaining stationary in our hands, as some authorities would have it to be believed; and if, therefore, we have been successful in developing the resources of the soil, I hope that the satisfactory conclusion to which the statistical inquiry has been brought, and the compliment paid to us by the Lords of the Committee of Privy Council for Trade, tend to show that our intellectual improvement has not been altogether dormant. But in thus admitting that credit is due to the agriculturists of Scotland for intelligence and public spirit, in the manner they so readily responded to the call made to forward a great national undertaking, I would be guilty of an unpardonable injustice to Mr. Hall Maxwell were I not also, upon this occasion, to say that I represent the unanimous feeling of that body in ascribing the success of the statistical inquiry to be mainly dependent on the great ability, energy, prudence, and tact which he brought to bear, not only on the difficulties he had to encounter, but also the vast amount of labour he had to contend with; and last, but not least, the perfect confidence he secured by the strictly confidential manner in which he treated all communications made to him. If this inquiry proves important in a national point of view—and who can doubt but such must be the case?—it is our opinion that Mr. Hall Maxwell has well earned the complimentary reference made to his 'indefatigable exertions' in the official document just read, and also the gratitude of the general community."

We have not space this week to present the facts which appear upon the face of the statistical report of the agricultural condition of Scotland during the past year, or the truths which those facts teach us. The main points, as regards extent and quantity of produce, were given last week. And it is curious to note, as is done in the *Edinburgh Evening Courant*, how absurdly at fault they prove the best existing agricultural estimates to be. M'CULLOCH's estimate—the one which, from the rank of this statist, we should have been most inclined to trust, is compared with the actual fact in the following figures:—

CROPS.	MR. M'CULLOCH'S ESTIMATES. Acres.	AUTHENTIC RETURN. Acres.
Wheat	... 350,000	168,216
Barley	... 450,000	207,507
Oats	... 1,300,000	932,994
Beans and Peas	... 50,000	43,871
Potatoes ...	... 200,000	143,032
Turnips ...	... 450,000	433,915
Flax	... 20,000	6,670

Out of seven particulars in this table, it will be seen that two are over estimated in the proportion of 2 to 1, one in that of 3 to 1, Oats and Potatoes are over estimated in the ratio of 3 to 2, and Beans, and Peas, and Turnips alone are anything near accuracy. This is in the case of a country which more than any other in the world is systematic in its agriculture. What the much less perfect data on which alone an estimate in England rests have led to as compared with the actual truth, cannot yet be told. We shall know it in a year or two, however. Of that we are sure, for the success of this experiment in Scotland must ultimately ensure success throughout the country.

AGRICULTURE IN THE WEST OF FRANCE.

M. BAJAULT, an eccentric but clever cultivator of his property in the department of Deux Sèvres, left at his death, a few years ago, some humorous essays abounding in quaint and pithy proverbs, which have been collected and published by M. Rinffel, the director of the model farm at Grand Jouan. The author himself had been very well educated, and was formerly a deputy of the general council of his department. He lived to the age of 70, and was greatly in advance of his contemporaries and neighbours in practical husbandry. During many years he had circulated an enormous number of copies of an almanack abounding in pointed aphorisms, and containing excellent instructions for social and agricultural improvement. He popularised husbandry with a degree of humour and talent which his lively countrymen fully appreciated.

Many of his suggestions addressed to the *comices* (agricultural assemblies) abound in valuable matter. I shall adduce a few illustrations of his graver style and matter, avoiding the burlesque passages in which he so frequently indulges. Having defined a *comice* as a congress of proprietors, farmers, and cultivators, and assumed that its first duty is to study the agricultural circumstances of its own arrondissement, and eulogised its usefulness if it acts upon right principles and a good system, he asserts that rather more than half of France consists of *boccage* (woodland), in which semi-pastoral husbandry leaves most of the land uncultivated. And he points out the absolute necessity of increasing the productiveness of the native soil, since the increasing population cannot be driven onwards to fresh land, as in the steppes of Russia and the back woods of America. That the productiveness of even the worst soils may be increased by labour and manuring, he illustrates by the fact that cottage gardens, and small fertile fields adjoin tracts of barren moors from which the industry of man, with the aid of enriching farmyard dung, has reclaimed them; and it is to the modes of accumulating fermenting or mixed manures that he consequently directs the main current of all his reasonings. With this preliminary aphorism that "agriculture is a science of locality but of general principles," he informs that (12 or 14 years ago at least) in the department du Nord, which annually expends 1,200,000 francs in marl, lime, and ashes,

besides fecal substances and farmyard manures, there was, when he wrote on the subject, one-sixth of the land under fallow. He complains also of the exhausting system of corn-growing in the west of France whenever the soil admits of it, and of the miserable products, so frequently diminished still more by unfavourable seasons—the result being an impoverished population without energy, and tortured by bitter want. One-eighth of the land only is cultivated in the wood-land localities, and the only food for cattle that are never housed is according to the statement miserable natural pasture, on which they starve during 7 months of the year. The farms are of 50 hectares, with one plough and very few labourers—because there is no employment for them. He urges then most strongly the extended introduction of artificial Grasses and root crops for cattle feeding, through the agencies of *comices*, and of individual proprietors, imitating the exertions of such benefactors to the country as the late M. Dombasle, at Roville, and of M. Bella, at Grignon. Yet he would not innovate too suddenly or harshly, demanding unreasonable concessions from the prejudices of the peasantry; but make changes by convincing their minds, by example and agricultural education, so necessary to second the efforts at amelioration, and he emphatically warns improvers to test their new practices fully, lest any failure of success in them should weaken their local influence, and give strength to the ignorant prejudices which it is their object to overcome. Without a previous knowledge of the peculiarities of soil and climate an agriculturist, however right in his general principles, may commit blunders in practice which he would have avoided by modifying his practice, according to local peculiarities, if he had been acquainted with them. In short, M. Bajault, in such case advises modern improvers not to force a system on any of the old-fashioned local cultivators, but rather to trust to time and example for the establishment of it.

It appears that British farmers are not the only victims to the frauds of manufacturers of manures. The *noir animal* (produced from bones reduced by fire to dust, and saturated with the dregs of sugar in the refining houses) is mixed by French rogues with peat soil, ground into powder for the purpose.

M. Bajault goes largely into the subject of manures and alteratives for the soil; but the only portion which I think worth noticing under this head is that which relates to gypsum, the value and use of which have been vexed questions among ourselves.

After 30 years' experience he came to the decision that gypsum (*plâtre*) is one of the best applications to Grass land, and a mine of wealth wherever found, notwithstanding the objections that have been urged against its efficiency—objections arising from ignorance. He admits, however, that on cold wet clay soils its utility is very questionable, and suggests the expediency of trying its effects on different soils on a small scale before it is largely used. Its application to cereal crops he pronounces to be utterly useless, but on Clover, Lucern, Saintfoin, Vetches, and the leguminous plants generally, as upon all the artificial Grasses, it has unquestionable efficacy; and, contrary to the opinion of the scientific Boussingault, that (since lime is the valuable component part of it) the application of gypsum is of no value on calcareous soil, or in the precise phraseology of this great chemist, that gypsum acts only on those soils which do not contain a sufficient amount of lime in the state of carbonate, the practical man under notice asserts that on such soil and especially where limestone exists, it does wonders and is more efficacious than dung! In dry summers it will not however, he admits, be active, nor will its effects in such case appear until the ensuing season; but in a moist summer the blades and foliage generally of the tribes of plants to which it is congenial, will have more freshness and verdure than atmospheric moisture produces on them without the intervention of gypsum. As an agent on the light soils of his department, he considered it to be a chief agent in promoting the increase of green and dry fodder for cattle, and consequently of manure for cereal crops.

Whether gypsum ought to be calcined, or merely ground into dust before spreading, has been discussed in some of the interesting papers which have appeared in the *Agricultural Gazette*, upon the quality and uses of gypsum.* Professor Way stated in a lecture before the Royal Agricultural Society of England, that "there was no difference between burnt and unburnt gypsum as an absorbent, but that gypsum in a dry state could not absorb ammonia—that burning made it easier to pound, but by thus rendering it a cementitious powder it was more liable to cake when used." In America, and on the continent of Europe, where it is found, we believe the universal practice is to apply gypsum in the unburnt state after it has been ground to a very fine powder, and to scatter it during the morning dew of a spring day, or in foggy weather, at that season. The French gentleman whom I have been quoting used to give a dressing of it to perennial Grasses three years out of four. He entreats farmers to apply gypsum to a portion of Lucern, &c., leaving the remainder without it, and then perceiving the marked difference in the productiveness, so favourable to the character of gypsum, to apply it systematically, though the Englishman abuses it. The German, however, comes in for his approbation, as he (the German) declares that "without gypsum and Potatoes, we might give up our land." Though gypsum is frequently found in England, it is very partially found in Ireland, where the new red sand-stone is of rare occurrence. I believe that gypsum is discoverable only in parts of Ulster, and until within a comparatively recent period its use in agriculture was not known. Professor Kane gives this analysis of it:—

Sulphuric acid... ...	46.5
Lime	32.6
Water	20.9
	100.0 of gypsum or sulphate of lime,

and pronounces that "the practical value as a manure is undisputed, although difference of opinion exists as to the mode of its action;" and "its peculiar value consists in supplying lime for the rapid growth of Clover and other papilionaceous crops, which its moderate solubility in water enables it to effect better than any other compound of that earth." *D.*

* See *Agricultural Gazette*, June 28th, 1851.

STATISTICS OF CATTLE FEEDING.

(*Concluded from p. 91*).

As a feeder of cattle for the butcher I am differently circumstanced to other of your readers; having a great proportion of my holding in permanent Grass, the great bulk of my fodder consists of pasture and meadow Grass, to which my root crops are an adjunct. I usually finish off two sets during the year—one in the early winter months, for sale in December and January; the other in July and August. I prefer purchasing for feeding cows which are sold by dairy-keepers giving too little milk for their purposes. I have shown that with a yield of 6 to 8 quarts per day, which will pay for their food, they gain on the average 7 to 9 lbs. per week.

I make up 15 to 20 heifers during the season; these are usually bought on during the spring, and turned upon the more distant feeding pastures till October, when they are finished off with Turnips and other winter food; these are scarcely sufficiently long on winter food to admit of a fair estimate of their gain. I have occasionally had animals of this class under treatment from 16 to 18 weeks, when I have found their weekly gain to average about 14 lbs. In your *Gazette* (Dec. 24, 1853) I described the result of two sets, each of eight heifers, on very similar treatment to that I am now using; the gain of each lot will be seen to have averaged 14 lbs. per week, one lot being under treatment 16 weeks, the other 12 weeks. On one lot, and towards the close of feeding, I nearly doubled the quantity of extra food during six weeks without increasing in any degree the gain of weight. My heifers of the present season (18 in number) are doing remarkably well; owing to the fine weather of October they were left on pasture till late in that month, and sold off chiefly in December and January, being scarcely two months in-doors; I refrain from giving their weighing. I may here state that by keeping my cattle over from October to November, I enjoy usually a gain beyond what is strictly due to the gain of weight, by a rise in price after November—a month in which the Grass-feeders throughout the country, who do not tie up, bring their stock to market in whatever condition they may be. Leaving this rise of price out of question, and assuming a gain at the rate of 14 lbs. per week each, which is the general rate I am able to effect—like other cattle buyers I occasionally meet with animals which do not gain their share; if, however, the gain be very materially under the average, I sell them off at a much earlier period as soon as I can find a purchaser; my proximity to the towns where they are killed gives me frequently an opportunity of ascertaining the cause; I usually learn that it is owing to some defective or diseased organ, adhesion of the lungs to the side being the most common explanation—assuming, then, a gain of 14 lbs. per week, and taking the same data for computation given in a former part of this, which, with this gain, shows a return of 6*s.* at the uniform rate of 6*d.* per lb.; and leaving out of consideration the fluctuation in price, or increase of value consequent on improved quality, it will be seen that I calculate the carcase of the fat and store animal at the like rate, though their value to the butcher is very different. The computation will be as follows:—

	Per week.
Gain in feeding a light heifer	6*s.* 0*d.*
Yield of excrement, solid and liquid, per day (60 lbs.)	2 0
Total	8 0

To ascertain the quantity of excrement, the yield from 11 heifers made during 14 days was weighed from the tank, and found to be 9220 lbs.—60 lbs. each day or 420 lbs. per week. The construction of my stalls, in which a channel of 2 feet 6 inches in depth by 2 feet 6 inches in width, under the tails of the animals, and covered by an open grating of wood, receives the whole of the liquid and solid excrement which is drawn from under the cattle when the tank is filled, gives me peculiar advantages of ascertaining the weight of the excrement, and I note this in my book of registry. The following may be reckoned on as sufficiently accurate (liquid and solid together):—

For heifers of 7 to 9 cwt.,	60 lbs. per day,	or 420 lbs. per week.
Cows and heifers of 11 to 12 cwt.,	72 lbs. „	or 500 lbs. „
Milch cows of 9 to 12 cwt.,	80 lbs. „	or 560 lbs. „

The milch cow eats and drinks more than the feeder, and with more of excrement, is by far the greatest producer of food adapted to the use of man. My cattle are supplied with water only to the extent of their wants; with a full feed of Turnips or other succulent food, which supply nearly double the quantity of water necessary, their excrement will be proportionably increased in quantity without any addition to its value. From analysis by Professor Way, made of the excrement of my feeding stock on similar treatment, the per centage of nitrogen was found to have increased during the course of feeding described in your journal, Dec. 24, 1853, from 52 nitrogen=62 ammonia to .94 nitrogen=1.14 ammonia; the value in the first being computed at 8*s.* 6*d.*, in the second 15*s.* per ton. I therefore assume a value in the present instance of 10*s.* per ton. I compute the cost of food:—

		Per week.
Rape-cake 4 lbs., bran 2 lbs. per day		2*s.* 2½*d.*
Half a pound Bean meal per day		0 3½
		2 5¾
14 lbs. Bean and Oat straw with rough seeds ...	1*s.* 2*d.*	
56 Swedish Turnips, at 10*s.* per ton	1 9	
		2 11
Attendance, 6*d.*, coals, 1½*d.*, cooking, 1½*d.*		0 9
		6 1¾

The Rape-cake and bran are computed at the rate I have paid for them this season 5*l.* 15*s.* per ton, the straw at 35*s.* 4*d.* per ton; this is reduced by an admixture of rough seeds or shells of Oats which I obtain at a lower price; my Turnips at 10*s.* per ton. Since I procured my weighing machine I have weighed portions of this crop with a view to form an accurate estimate of their yield per acre. I find them to average 24 to 25 tons of bulbs, with several tons of tops, which latter are given to sheep on depasture. I am about 60 to 70 miles distant from the coast; the nearest observations of the rain gauge 12 miles eastward show an average fall of rain of about 30 inches in the year. In 1854 it was much lower, being scarcely 24 inches, yet my crop of Swedes is more than an average, being nearly 20 tons of bulbs to the acre. My mode of cultivation is the same I have already described for Cabbages and Kohl Rabi, but without intervention of Potatoes. After autumn cleaning I plough in the fresh excrement as deep as I can, when it is left till sowing time, and then worked with the cultivator and harrow, and finished with the Cumberland clod-crusher, an implement to the use of which I am very partial. Before sowing on a slight ridge I strew broadcast 2 cwt. per acre of Gibbs' guano, which is worked in with a light harrow prior to ridging and sowing. My land under the plough is strong retentive loam on clay, and in high condition. I have been thus particular in describing my Turnip crop and its treatment, with a view of conveying to your readers an idea of my ability to grow them at the rate I have mentioned—10*s.* per ton.

From the foregoing statement, it will be shown that I am opposed to the teaching that live stock are necessary evils, mere manufacturers of manure, and consumers of a large amount of produce without attendant profit. I look upon them and treat them as manufacturers of food for man in milk and beef. I regard the excrement or manure as the best means of resuscitating and nourishing those plants which served as food, and from which this excrement is derived.

From the windows of my dwelling I look upon an extent of rich pastures, which, from time immemorial, have been browsed upon by fattening stock, from each acre of which there will probably have been carried off an increase of fat and flesh of 2 to 2½ cwt. per year. These animals being well grown, the increase of bone will have been nil or trifling, the nitrogen abstracted by the increase of fibrine or flesh will have been restored by the atmosphere, the phosphates and other minerals will have been given back in the dung; the nitrogen applied to the maintenance and replenishment of the waste of the animal will have been safely conveyed to the soil in a torrent of water 100 times its own weight, in the non-volatile form of urea. With this treatment, and probably without ever having received a spoonful of extra manure, these pastures maintain the repute of carrying the same stocks and of preserving their fertility, without (as far as observation goes), any change in the character or properties of their Grasses. In an adjacent meadow, from which the produce is carried to the homestead for soiling and hay, the manure from this produce is conveyed back to replenish the same ground for the production of future plants. If we omit this, impoverishment with decreased produce is the sure result.

It is remarkable that if we apply other manures a change of plants is the consequence. After a dressing of lime, bones, or phosphates, we observe a greater comparative increase of the Clovers and under Grasses, whilst from an application of guano, soot, or other ammoniacal manures, we find an increase of Cocksfoot, Dogstail, Oat, Rye, and other stronger natural Grasses. Even if we add to the Grass and hay cake or other highly nitrogenous food, we observe a like effect in the change of plants. I adduce this as strongly corroborative of the soundness of Liebig's teaching, that the excrements from plants used for food are the best manure for those very plants from which it is derived.

In the vicinity of a large town, and at no great distance, the land is principally held by small dairy farmers, who occupy from 16 to 25 acres, and seldom more than 30. I happen to enjoy such relations with a number of them as enables me to acquire information of their procedure. Their holdings are in permanent Grass, meadow, and pasture. Some of them have recently obtained leave to break up a single field of 2 to 4 acres, which they alternate with Oats and Swede Turnips, half the field being cropped with a white, and half with a green crop. On a farm of 16 acres 3 milch cows are kept in summer on depasture; in winter, on hay with Bean-meal, mixed with chaff or rough seeds, the mess called lick (being moistened with water), and a sparing allowance of roots. The extra food enables them to maintain

the fertility of their land, which they find it their interest to do. Though within two miles of the town, they purchase little town manure, and they scarcely know the use of guano. The rent of their land, which is of fair quality, will average nearly 4*l.* per acre, being in rent alone a charge of nearly 8*l* per cow. Their produce, new milk, fetches 2*d.* per quart. On their small holdings the farmers maintain themselves (observing strict frugality) in decency and comfort. I have the means of knowing that they pay their rents promptly and without murmur; they grumble at the borough rates, which have been recently imposed, the neighbouring town having not long been incorporated. They are so sore about these new borough rates, that if they had the chance I should not be surprised if they would relinquish the right of voting for their council, and perhaps even their member, if at the same time they could relieve themselves of their new burdens.

On the other hand, and at a greater distance from the town, the land is in much larger holdings farmed by tenants, some of whom pay 400*l.*, 600*l.*, and 800*l.* a-year. A considerable proportion of these is in permanent Grass, some with more, others with less under the plough or in tillage, on which they cultivate corn and root crops; the latter are used as adjuncts to feeding. Being more remote from population, they pay little attention to dairy produce; their cattle, of which they maintain large numbers, are chiefly employed in fattening. I am personally acquainted with a number of these tenant farmers; I meet them at fairs and markets. They use great care in selecting, and bargain hard for their stock. Sometimes, after hours of contention, they will insist that the odd shilling to which the difference between the ask and the bid is reduced, shall be split, or otherwise relinquish their bargain. They have the repute of being well to do, of discharging all their obligations, including their rent, though I am not so particularly informed as with respect to the small dairy farms. I am sufficiently so to know that they could not do this without a handsome profit from fattening their cattle. *Y., January*, 1855.

Erratum.—At page 91, column first, the food supplied to milch cows should have been stated as consisting of—

		Per week.
5 lbs. of Rape-cake and 2 lbs. *bran* per day		2*s.* 7½*d.*
½ lb. of Bean-meal, per day		0 3½
Cost per week in extra food		2 11
	Per week.	
12 lbs. meadow hay, at 3*s.* 6*d.* per cwt.	2*s.* 7½*d.*	
10 lbs. Bean and Oat straw and shells of Oats	1 0	
32 lbs. green food, 10*s.* per ton	1 0	
		4 7½
Attendance, 1*s.*; coals, 1½*d.*; cooking, 1½*d.*		1 3
		8 9½

Home Correspondence.

Distribution of Horse Labour.—Under this head a communication appears in your last week's paper, which, in one or two particulars, requires some qualification, if not explanation. I refer to the amount of daily labour supposed to be done by a pair of horses—1st, in carting manure, which is uniformly set down at 50 loads per diem: we must hence infer that each field is at an equal distance from the manure heap, and that a very short one, for if the manure is at all heavy, 50 loads is a large number to fill, to lead, and to empty in a day, far more than I am inclined to think can be generally done. [100 loads can easily be carried half a mile by 4 horses in as many carts—filled by 3 men, led by 3 lads, and emptied by one man.] 2dly, in ploughing: if the land be light, and the depth not much, a man may go over 1¼ acre in a day, with a large slice; but if the soil is at all heavy, and a depth of more than 4 inches wanted, both horses and man must walk a good pace to get over the ground, supposing the furrow slice to be laid evenly so as to present everywhere a new surface to the air, *i. e.*, fairly stirring the whole field. My experience is somewhat limited, but it leads me to the conclusion that 1 acre a day well done is as much as an ordinary pair of horses with average weather, soil, and state of health can reasonably be expected to manage continuously day after day. [Remember that weather is accounted for in the number of days allotted per month.] 3dly, in harrowing: this operation may be supposed to include scuffling, for which the labour of two horses is inadequate, whereas on the other hand, with light harrows, a pair of horses may be expected to go over more than 10 acres a day, and I think the number of times mentioned for harrows being used is not sufficient where the land has any adhesive property about it, or is not wonderfully clean. [Harrowing is not supposed to include scuffling—that is included in the term "cultivating."] *J. W., Peterborough.*

Is Wilkins's Plan for Applying Liquid Manure to the Roots of Plants a Novelty?—Having observed a letter by Sir J. T. Tyrrell, Boreham House, in your Paper of the 3d inst., in respect to my mode of applying liquid manure to the roots of plants, and assuming that a plan introduced by the late Mr. Wix, in the neighbourhood of Chelmsford, for the growth of Celery 10 years ago, is identical with my system, and therefore, on such assumption, concluding that my plan is not novel; allow me to tell your correspondent, that from his description of Mr. Wix's plan and his own practice, there is no likeness whatever between my system of applying liquid manure and air to the roots of plants, &c., and the mode which he advocates—which must be quite apparent to every one who has visited my experimental garden at Reading, or heard me describe it. So that Sir J. Tyrell need not be under any apprehension that a toll is to be levied on his neighbours for continuing their old practice. I feel obliged to your correspondent for his evidence in behalf of the practical results of my system, by his saying that "I have no doubt of the truth of all the circumstances stated by Mr. Wilkins," and I beg to assure him that if he will attend my next lecture on the evening of the 16th inst, at the City of London Tavern, I will undertake to satisfy him or any of his friends that my plan is not that of Mr. Wix's or any one else; that the objections which he urges about the Mangold Wurzel sending their roots far for food and choking up the pipes are not applicable to my system, and therefore can be no objection. *Edward Wilkins, Walworth, London, Feb. 7.* [We have received the following from Sir J. Tyrell, since the publication of his former letter:—In my letter of last week, written in haste, I omitted to say that the patent plan of growing plants and corn in a pan appears to me liable to this objection:—that there is no contrivance for the escape of over moisture by rain in a wet season. All the money hitherto expended in draining land would thus be thrown away. *Boreham House.*]

Underground Manuring.—I am very glad to see Sir John Tyrell has protested against Mr. Wilkins's plan being a new one. I beg to say so far back as 1840 Mr. King, the then landlord of the Plough, in Chelmsford, adopted the plan by putting two rows of tiles under each row of Celery, and conducting the liquid manure from the yard into them, by which means, if I mistake not, he took the first prize for Celery in 1841. Therefore I trust Mr. Wilkins will not put a tax upon us for following the plan which has been working well for 15 years. *Thos. Cope, Llangedrum Hall, Feb. 7.*

Effects on the Turnip Crop of various kinds of Manure.—In the extract from Mr. Hunt's paper on this subject, (read to the Wakefield Farmers' Club), given in last week's *Agricultural Gazette*, there is no mention of the kind of the Turnips grown—the kind of soil on which they were grown—or the weight of the different crops per acre. This, I think, is an omission to be regretted; for without such information, especially the weight of the Turnips grown, the results of the experiments, though so far useful and interesting, are but vague and indefinite. If you think the subject worth further notice in the columns of the *Gazette*, perhaps you will allow me to ask the writer of the paper to give you, if he can, this desirable (as I think) information. The price per ton paid for the guano might be stated at the same time. *T. B. R., Liverpool, Feb. 7*, 1855. [Perhaps Mr. Hunt will be kind enough to supply the missing information.]

Beans v. Roots.—Will you or any of your correspondents kindly enlighten us on the comparative value in feeding of a crop of Beans, 40 bushels per acre, and a crop of Swedes, 20 tons ditto. A tenant of mine tells me that the Beans will produce the most beef and mutton; if this be so, we are wrong, on heavy lands, in growing roots, as the Bean crop is considered much cheaper in cultivation. I have left off for some years growing Beans, as I found them so often blighted, or stunted, through drought. I always grew them on the Scotch system, 27 inches apart, using the horse hoe between. *Anti Faba.* [We believe that 20 tons of Swedes will make more beef than 40 bushels of Beans; but it is easier to grow the latter than the former on an acre of clay land. It is impossible to compare them directly in their feeding powers, because each requires other food to be given with it, and the supplementary food in the two cases would be different.]

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Weekly Council, *Feb.* 15.—Mr. Fisher Hobbs in the Chair.

Veterinary College.—The Annual Report made by the Governors of the Royal Veterinary College to the Council, was read. The following portions are selected on account of their general interest:—

1. Pleuro-pneumonia.—Although the cattle throughout the country suffered in this as in previous years from the epizootic affection, pleuro-pneumonia, still the losses have been by no means so great as on former occasions. The nature of this disease, when it becomes fully established in the system, is such that it will ever render ineffective the best curative measures which science can devise, but, notwithstanding this, there are many reasons for believing that preventive means may be had recourse to with decided benefit. From investigations made by their Professor, during the past year, the Governors have no reason to alter the opinion expressed in a former report, that the inoculation of cattle will prove either a safe or an effectual preventive of pleuro-pneumonia. This system of inoculation is not based upon any known principle of medical science which regulates the *artificial* production of a disease to give immunity to an animal against a *natural* attack of the same malady. The Governors are induced to make these remarks from observing that attempts are again being made to introduce the system of inoculation, under the plea that it has proved highly advantageous in numerous instances on the Continent, and therefore it continues to be practised in France, Belgium, and Germany. With regard to the true principles of preventing the extension of pleuro-pneumonia, it cannot be doubted that these will be found in removing the diseased animals from the healthy, in altering the system of management and feeding which was in use when the malady first appeared, and in exhibiting to the animals which had been exposed to the contagion mild aperient, diuretic and diaphoretic medicine, in succession, to rouse the emunctories of the body, and following up these remedies by tonic and stimulating agents to invigorate the vital forces. This plan has been adopted in numerous instances with the best results, many animals being thereby saved which otherwise would have been sacrificed to the disease.

2. Disease in Lambs.—On the subject of epizootics the Governors have to remark that in the spring of last year a malignant form of aptha appeared in several districts among the lambs and destroyed very many of these animals. From this affection having been observed in a comparatively mild form the year before, in a few isolated cases only, and from its great prevalence as well as malignancy in 1854, it is to be feared that it may take on the character of an epizootic and thus add another to the list of these diseases which have been so destructive of late to our cattle and sheep. Numerous letters have been received from the members of the Society detailing the progress of this disease, and the great losses which they had sustained thereby. Professor Simonds has also personally investigated the causes which appear to favour the production of the malady; but much still remains to be done, as in consequence of the disease having shown itself under the most opposite circumstances of breed, age, vicissitudes of weather, locality, plan of management, &c., the evidence obtained is most conflicting. The Governors, have, however, every reason to believe that the mystery which envelopes the secondary causes of this affection will vanish before a rigid and scientific research. In the meantime they have much pleasure in stating that the recommendations of their Professor with regard to the treatment of the animals, and which were necessarily varied in many cases from the differences in the predisposing causes, have been attended with a satisfactory result.

3. Poisonous Oilcake.—Attention has recently been called to the injury done to the feeders of cattle by the manufactory of an impure oil-cake by which the lives of their cattle were often placed in jeopardy. This important matter, it will be remembered, was brought before the Council in consequence of some cows having been poisoned in the county of Yorkshire from being fed with cake made from Mustard seed, and sold as a cheap feeding material, as well as an energetic manure when applied to the land. The publicity given to the subject excited the most lively interest, and there is every reason to believe that the pernicious practice has received a well-timed check.

4. Dentition of Ox, Sheep, and Pigs.—The Governors would next call attention to the labours of their Professor, as Veterinary Inspector to the Society, in investigating the progress of dentition of the ox, sheep, and pig, with a view to a correct understanding of the ages of these animals as shown by their teeth. The facts arrived at from a careful examination of the animals exhibited at the Windsor, Lewes, and Gloucester meetings, were brought before the Society in two lectures delivered by the Professor in May last. So highly were these lectures appreciated, that the Council at its first meeting in June unanimously resolved, on the motion of Mr. Fisher Hobbs, "that on account of the immediate practical importance of the two lectures recently delivered before the Society by Professor Simonds on the age of animals as shown by their teeth, these lectures be at once prepared for publication in the second part of the Journal for this year; but as that number will not be due till the 1st of January next, that Professor Simonds be allowed to print off from the type and woodcuts as many copies as he may require for the purpose of publishing the lectures in the form of a pamphlet, at a cheap rate, in time for purchase by the public at the Lincoln meeting." In accordance with this resolution the matter was prepared for the press, and was in the hands of the members by the time appointed. The Governors have the pleasure of adding that, although the sale of the work has as yet been limited, owing to the fact of the matter it contains being about to appear in the forthcoming number of the journal, still it has been spoken in of high terms of commendation by those who have made themselves acquainted with its details. The facts arrived at with regard to the age of the pig, in particular, have already been of essential service, not only to the Royal Agricultural Society at its meeting at Lincoln, where many animals were detected as being much above the certified age, but also at the recent shows of the Smithfield Cattle Club, and the Birmingham Cattle Society. The reprehensible practice of sending animals of improper age, and which there are too many reasons to believe has prevailed to a great extent, with a view to carry off the prizes, has thus received a salutary check.

5. College Privileges and Promotion of Veterinary Science.—The consultations by letter on the diseases of cattle and sheep have been fully as numerous as in former years, and the recommendations for the treatment of the several cases have been duly appreciated by the members seeking the advice. With reference to the admission of cattle, sheep, and pigs into the College Infirmary when the subjects of disease, the Governors would be much gratified to find that the members of the Society availed themselves of their privileges to a far greater extent than at present. They cannot but think that the small number of animals sent from the country, arises from the supposition that the charge for their treatment is more than the proprietor feels justified in incurring. This impression the Governors believe will be at once removed when they state that the sum fixed upon for the keep, medical treatment, operations of every kind, and all other necessary things, is but 1*s.* 6*d.* a day for a bullock, and that sheep and pigs are charged for at a proportionate sum, which is fixed by the principal according to circumstances." The average number, however, of diseased cattle has been admitted into the infirmary during the year, but the Governors not finding among them any remarkable cases calling for especial description, have thought it unnecessary to add to the length of this report by a detail of particulars. They would, however, remark that these cases have afforded their Professor the opportunity of giving clinical instructions to the Class and of demonstrating several of the operations necessary to the success of the practice of Cattle Medicine. During the session the Lectures have been regularly delivered as heretofore, and the attendance of the pupils has been most satisfactory. The class has also been more numerous than in former years, and the progress of the pupils in their studies, as shown by the examinations to which they have been subjected from time to time, has been such as to merit the approbation of the Professors in general.

The Council having received at their last December meeting a communication from the French Government, requesting the aid of the Society in investigating the nature of a disease which had made its appearance in Turkey among the cattle intended for the Crimea—the Council at once instructed Prof. Simonds, as the Veterinary-Inspector of the Society, to place himself in immediate communication with M. Herbert, the Consul-General of France in London, and to furnish him with every information he possessed that might aid the French Government in their inquiry. The Report of the Governors of the Veterinary College contains the following reference to that circumstance:—

6. Contagious Typhus.—As a preliminary step, and with the sanction of the Consul-General, Prof. Simonds has prepared a list of questions to be forwarded to the several veterinary surgeons now with their regiments in the Crimea. These questions are annexed to this report, and the Governors trust that the Society will agree with them in the opinion that on answers being obtained such an amount of information will be possessed on this subject as cannot fail, when acted upon, to be of essential service in effecting the desired object. It is likewise to be remembered that the history of these epizootic affections shows that when once they have taken root in any of the countries of Europe, they have spread with greater or lesser rapidity over the whole Continent, destroying the cattle by thousands in their course. It is this circumstance, added to the fact of the existence of the disease in Turkey, which has created so much solicitude on the part of the French Government, and the Governors cannot but feel equally anxious in the matter, seeing that if the cattle in France or Germany should become affected, our own would ere long fall victims to the direful pest, from the free importations of animals which now exists.

The report is concluded with the following—

7. General Observation.—The Governors thus hope that,

without their calling attention to every circumstance which has transpired since their last report, they have said sufficient to show to the Society that they have endeavoured to promote the advancement of veterinary science in its application to those animals which constitute so essential a portion of the wealth of the agriculturists. These efforts they believe only require to be continued to accomplish all which the most sanguine minds could wish to arise from the firm union which now exists between the Royal Agricultural Society of England and the Royal Veterinary College.

On the motion of Mr. Brandreth Gibbs, the Council accepted this report with their best acknowledgments to the Royal Veterinary College, and their high sense of the value of Prof. Simonds' zealous exertions to carry out the objects of the Society in the application of veterinary science to the diseases of domesticated animals.—The Chairman considered Prof. Simond's work on the Dentition of Animals a valuable hand-book which ought to be in the possession of every farmer.—Prof. Simonds, in acknowledging the vote of thanks to the college, and the compliment paid to himself, expressed his regret that the members of the Society did not avail themselves to a greater extent of the privilege they possessed of sending diseased animals to the college. Such supply of living and dead animals would lead to investigations of the highest importance connected with the nature of the diseases affecting the live stock of the farmer, and perfect the pupils about to be sent out into different parts of the country in that branch of their instruction.

Miscellaneous Communications.—Mr. MacOwen on the Lung Disorder among Cattle.—Mr. Beddoes on the Nature of Fibres stopping Drain Pipes.—Mr. Graburn on the Value of Cock's-foot Grass.—Mr. Johnson, of New York, on President Jefferson's Communication to the Board of Agriculture on Mould-board.—Messrs. Dawe and Co., on Specimens of Wheat.—Mr. French on Employment of Guano and Super-phosphate.—Mr. Miallemiss on the low State of Agricultural Practice in South Australia, and the Formation of an Agricultural Society at Geelong.—M. Van Langenhove on Quincunx System of Cultivation.—Mr. Burcham on Circular System of Cultivation.—Mr. Cogan's Supply of Specimens of the original German Milk-pans from Mecklenburg.—Mr. Chandos Wren Hoskyns presented copies of his works, "Talpa, or Chronicles of a Clay Farm," and a "Short Inquiry into the History of Agriculture," for which the Council ordered their best thanks.—Mr. Caird expressed his opinion of the importance of the investigations and the course of progress by the Foreign Office in reference to the discovery of supplies of Guano and the nitrates. He remarked, that the bar-harbour of Tampico, as alluded to by the British Consul (in his despatch published in the Society's last journal) as unfit for the export of nitrates, was more so than that of Riga, Revel, and Archangel, which are also bar-harbours to an equal extent.

The Council adjourned to Feb. 21.

Highland, *February 7.—The Plough and its uses.*—Professor Wilson delivered an address on this subject at a meeting of the Highland Society this day, under the presidency of Professor Low, his predecessor in the chair of agriculture, Edinburgh University. His preliminary remarks related to the object of agriculture, stated, from a scientific point of view, as "the conversion of mineral into organised matter through the agency of plants." The history of the plough as the principal tool employed in this manufacture was given in great detail: and the maxims of Greek and Latin agricultural writers were quoted in illustration of those truths regarding its efficiency and uses, which, as they are independent of time, are as applicable now as when first penned. The English history of the implement was taken from Fitzherbert, Googe, Blythe, Markham, Tull, and latterly from Sir J. Sinclair. The present improved construction of the implement was described. And, in conclusion, the possibility of attaining the result, namely, *tilth*, in other ways than by the plough was discussed. "The plough does not cultivate; other implements are required—the roller, the harrows, the scarifier, to complete the work, which, after all, is not so well done as by one operation of the spade. What we want is, not ploughing, so much as cultivation, that process which the farmer by necessity performs in three, four, or five acts, not nearly so effectually as the gardener accomplishes in one." Professor Wilson concluded by a reference to the possibilities and probabilities arising out of the present state of the problem—how to cultivate by steam.

Notices to Correspondents.

Books: *Agricola.* "The Agriculturist's Calculator," by Blackie & Son, Glasgow, beyond a doubt.

Manures: *X.* Apply all manures of difficult solubility as early as possible in the spring, and of every solubility just before the plant needs them. That is the general rule. The instances are—bones—guano—nitrates—in February, March, and April, respectively on Grass land or young grain crop.

Potatoes: *S F.* The drills are thrown up as high as possible with a two-horse plough, then reduced by a double turn of the light harrows along drills, the sets dropped into the furrows, and the drills thrown up over them as before. Of hoeing, the aim and end is, a clean and loose soil, which can generally be attained by two hand-hoeings and two applications of the drill-harrow, followed of course by a final earthing up. If the spade is employed, the sets are dibbled in 6 inches deep, and the spaces between the rows kept loose and clean by forking. *S., Forfarshire.*

The Llama: *V Fontanier.* It is or was in the possession of Capt. Stirling, of Craigbarnet Place, Lennoxtown, near Glasgow; of Mr. Robert Bell, Listowell, co. Kerry, Ireland; of Mr. Bennett, Farringdon House, Berks; Mr. Thomas Stevenson, Oban, Argyleshire; Mr. Edwards, Pyenest, Halifax; and especially the Earl of Derby, at Knowsley, Lancashire. The late Earl of Derby was the largest owner of Alpacas in this country.

AMERICAN PLANTS.

JOHN WATERER begs to announce that he has published a new Catalogue of his Rhododendrons, &c., as exhibited by him in the Gardens of the Royal Botanic Society, Regent's Park, London. It describes the colours of all the Rhododendrons considered worthy of cultivation, with a Treatise on their successful management, and may be had by enclosing two postage stamps.

The American Nursery, Bagshot, Surrey, near Farnborough Station, South-Western Railway.

AMERICAN NURSERY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, &c., as exhibited by him in the Royal Botanic Gardens, Regent's Park, may be had by inclosing two postage stamps.

G. B. begs to call attention to his fine stock of Weeping Hollies, Coniferous Plants, Ornamental Shrubs, &c.—American Nursery, Windlesham, near Bagshot, Surrey, near Staines Station, South-Western Railway, where conveyances may be obtained.

ESTABLISHED ABOUT HALF A CENTURY.

SEED AND HORTICULTURAL ESTABLISHMENT,

SUDBURY, SUFFOLK.

BASS AND BROWN'S

NEW SEED AND PLANT LIST FOR 1855 contains

THEIR very select and choice Assortments of VEGETABLE and FLOWER SEEDS; superior Mixtures of the best GRASSES for PERMANENT PASTURES, PARKS, LAWNS, BOWLING GREENS, &c.; also AGRICULTURAL SEEDS of the finest selected Stocks; a great variety of Flower Roots and Bulbs suited for Spring Planting; descriptive lists of very choice collections of Achimenes, Gloxinias, Fuchsias, Verbenas, Petunias, Dahlias, Bedding Calceolarias, Chrysanthemums, Bedding Plants, &c.

The AUTUMN CATALOGUE contains lists of New and Select Stove and Greenhouse Plants, Geraniums, Cinerarias, Azaleas, Hollyhocks, Hardy Climbing Plants, Coniferæ, and other Select Trees and Shrubs, Roses, Herbaceous Plants, Fruits, &c.

Both Catalogues embrace a large amount of descriptive and useful information for the convenience of purchasers. Supplied free by post for three penny stamps each, or gratis to our customers who may not have received them.

GOODS (not under 20*s.*) CARRIAGE FREE to all the Stations in London, and all Stations on the Colchester Line, between London and Norwich.

The large number of letters of satisfaction and approval from persons receiving articles both of Seeds and Plants from our Establishment, and the annual increase of patronage of which we are every year in possession, is a certain proof that our care in providing the best of everything is appreciated by the public, to whom we desire to tender our best thanks.

BASS & BROWN'S ASSORTED COLLECTIONS OF VEGETABLE SEEDS

Contain everything which may be desired for superiority of sorts. The sorts and quantities of the collections are specified in the Catalogue. For any sorts not wished for, enlarged quantities of others sent to make up the amount.

No. 1. COLLECTION for a large garden, containing quantities sufficient for one year's supply	£3 0 0
No. 2. COLLECTION in smaller proportion	2 0 0
No. 3. COLLECTION ditto	1 5 0
No. 4. COLLECTION of choice kinds for a small garden	0 15 0

FLOWER SEEDS—BEST ASSORTMENTS.

These may be had pre-paid *by post at the prices affixed, with printed instructions for sowing and raising Seeds.*

100 varieties select showy Annuals, which will include the beautiful new Leptosiphons aureum and luteum, Escholtzia tenuifolia, Whitlavia grandiflora, and other choice novelties of the season, also splendid prize Asters, Stocks, Zinnia, &c.	15*s.* 0*d.*
50 varieties, including new, 8*s.* 6*d.*; 30 varieties do., 5*s.* 6*d.*; 20 varieties do.	4 0
20 varieties choice Greenhouse Annuals, including the new Gromphrena aurantiaca, Salpiglossis atrosanguinea, the new Portulaccas, Rhodanthe, Thunbergia, Phlox Drummondi, 7*s.* 6*d.*; 12 varieties do.	5 0
20 varieties best Dwarf Annuals, in large packets, for filling beds on lawns	7*s.* 6*d.*
12 varieties ditto ditto	5 0
20 varieties choice Greenhouse Perennials, including very fine and new Calceolaria, Cineraria, Fuchsia, Petunia, Verbena, Chorozema, Kennedias, Calendrinia umbellata, &c., 10*s.* 6*d.*; 12 varieties do. ...	7 6
20 varieties Hardy Biennials and Perennials, including very choice Antirrhinum, Gladioli, Heartsease, Mimulus, Polyanthus, Dianthus, Brompton, and Emperor Stock, &c., 7*s.* 6*d.*; 12 varieties do. ...	5 0

A FEW NEW AND CHOICE FLOWER SEEDS.

Any of the following not priced are 6d. per packet. Those marked thus (*) have been omitted in the Catalogue.

GREENHOUSE PERENNIALS. *s. d.*
Acacia, 3 varieties, each ... 0 6
Calceolaria, very choice ... 1 0
„ extra, from new ... 2 6
Calendrinia umbellata.
*Chorozema cordata ... 1 0
Cineraria, choice 1 0
„ extra, from new vars. of our superb collection 2 6
Cobæa scandens.
Coffræa Arabica (Arabian Coffee).
Erythrina crista galli ... 1 0
Geranium, choice 1 0
„ extra, from new vars.
„ of our superb collection 2 6
„ finest fancy varieties ... 1 6
Gloxinia, extra, from our superior collection of new and choice... ... ... 2 6
Heliotropium, choice.
Primula sinensis.
„ do. fimbriata ... 1 0
„ do. do. alba ... 1 0
„ denticulata ... 1 0
Tropæolum, 3 choice, 6*d.* to 1 0
Verbena, choice 1 0
„ extra new, of our superb collection 2 6

HARDY PERENNIALS.
Abronia umbellata.
Alstræmeria pulchella.
Antirrhinum, extra, from our superb collection ... 1 0
Aquilegia formosa.
„ glandulosa (true).
Carnation and Piccotee, extra, from collection of 400 varieties 2 6
Dactylis variegata, fine variegated new striped leaved Grass.

HARDY PERENNIALS. *s. d.*
Dianthus Dunnetti, very superb dark new Sweet William 1 0
* „ Burridgi, splendid new scarlet Sweet William 1 0
* „ maculata, very showy, red and white spotted.
Gladiolus, from choice named early varieties of our superb collection ... 1 0
Hollyhock, choice 1 0
* „ extra, from our fine collection 2 6
Iris anglica, from best vars. of our very choice collection 2 6
Lindheimara texana, new 1 0
Pansy, extra, from best collections 1 0
Potentilla, extra, selected from our finest named vars. 2 6
Ranunculus, from very choice of our superb collection 2 6
*Wallflower, beautiful, saved from imported vars.

GREENHOUSE ANNUALS.
Balsam, saved from choice imported varieties.
Gomphrena aurantiaca ... 1 0
Ipomœa quamoclit, new white.
„ rubra cærulea ... 1 0
Mesembrianthum tri. alba.
Phlox Leopoldi hybrid.
„ alba occulata.
Portulacca, six superior new varieties, each 0 6
„ fine mixed.
Rhodanthe Manglesi.
Salpiglossus atrosanguinea.
„ new yellow.
Schizanthus retusus albus.
„ Grahami carnea.

GREENHOUSE ANNUALS. *s. d.*
Thunbergia, six superior vars., each 0 6
„ mixed varieties.

HALF-HARDY ANNUALS.
Aster, Bishop's Prize, superb varieties.
Calceolaria chelidonioides, beautiful yellow.
* „ new Californian sp.
Grammanthes gentianoides.
„ gent. lutea.
Lobelia ramosus alba, major and roseus, each ... 0 6
Nomesia bicolor, new, beautiful, and very attractive 0 4
Perilla Nankinensis, new, very fine for bedding out, dark purple variety.
Pink, Imperial Indian, ex. 0 4
Podolepis rugata, new, large, bright yellow, fine.

HARDY ANNUALS.
Clary, white top, fine, new, and showy.

HARDY ANNUALS. *s. d.*
Eschscholtzia tenuifolia, new, delicate clean straw; very dwarf, neat, and attractive. A Certificate awarded at Chiswick ... 1 6
Gilia, Californian sp., habit of Capitata, flowers twice as large.
Iberis violacea superba, ex. deep purple 0
Leptosiphon aureum, very beautiful new bright golden, a Californian sp. Medal awarded at Chiswick 1 6
„ luteum, beautiful.
Limnanthes sulphurea odorata, new, yellow, edged with white and rose-col. stamens, very fragrant ... 1 0
Linum grandifl. rubrum ... 1 0
Lupinus Hartweggia rosea.
„ monogynia, fine light and deep purple.

A choice stock of Gladiolus lilium lancifolium, Tritonea aurea, Tigridius, Oxalis, Achimenes, Gloxinias, and a large number of other roots for spring planting, for which see Spring Catalogue.

Remittances required from unknown correspondents. Post-office Orders payable to Bass & Brown, or Stephen Brown. Stamps received for small amounts.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growth, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those who have tried the benefit of carefully saved seed; and as we have our Seeds Examined Free, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

DAWE, COTTRELL, AND BENHAM, beg to inform their friends and patrons that their Descriptive Retail LIST of FLOWER, GARDEN, and AGRICULTURAL SEEDS is now ready, and may be obtained, post free, on application.

D., C., & B. also beg to offer the following CHOICE ROOTS at very low prices.

IMPORTED GERMAN SEEDS.—Asters, Balsams, Stocks, Larkspurs, Poppies, Zinnias, &c., in named assortments, 2s. 6d. each. Ranunculus and Anemone Seeds, 2s. 6d. per packet.

C. Tyso's sovereign assortments of 18 select Ranunculus, and 18 choice Anemones, postage free for 21s.—Wallingford, Berks.

AMERICAN PLANTS.—A Descriptive Priced CATALOGUE of HARDY AMERICAN PLANTS for the coming season is just published, and may be had by enclosing two stamps for postage. As everything in the way of American Plants is grown to an unequalled extent at this Nursery, intending purchasers would do well to provide themselves with this Catalogue.

WATERER AND GODFREY, Nephews and Successors to the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

W. DRUMMOND AND SONS' NEW DESCRIPTIVE CATALOGUE, containing select varieties only, of VEGETABLE and FLOWER SEEDS is now ready, and may be had post free on receipt of one postage stamp. This Catalogue will, at a glance, furnish the Gardener with all the necessary material for drawing out his Seed List correctly and without trouble. In reference to it the *Gardeners' Chronicle* remarks:—

"It is simple, short, and one of the best we have seen. They are pursuing the sensible course we have so often insisted upon for the sake of both buyer and seller;" and this opinion has been cordially responded to by all our old and many new customers.

W. Drummond & Sons' Seed and Implement Warehouse, Stirling.

NEW CINERARIAS.

C. H. GARDINER, of Fant Nursery, Maidstone, will commence sending out plants on the 1st of March next of the following first-class flowers, raised by Mr. Frost, gardener to E. L. Betts, Esq., of Preston Hall, and pronounced by competent judges to be equal if not superior to any in cultivation.

LADY JULIA CORNWALLIS—White, with great depth and width of petal, finely margined with porcelain blue, light blue disc, fine shape, extra size; first-class flower. 10s. 6d.

MISS BANNERMAN—Clear white, with well defined margin of rosy crimson, dark disc, large fine-shaped petals; habit good; one of the best. 10s. 6d.

MRS. R. RICKETTS—White ground colour, with broad margin of rich plum; good form and habit. 10s. 6d.

SIR W. MIDDLETON—Deep purple, with distinct ring of crimson round the disc; large fine-shaped petals of extra size and good habit; first-class flower. 10s. 6d.

MATILDA—White, with purple lilac edge; light disc; good shape and habit. 5s.

FORGET-ME-NOT—Fine shaped petals; colour crimson purple; good habit and fine form. 7s. 6d. If the set of six be taken, the price 2l. 10s.

IMPORTANT TO ALL PLANTERS WHO DESIRE IMMEDIATE EFFECT.

WM. JACKSON AND CO., Bedale, Yorkshire, will supply the following choice stock, of good quality, at the annexed low prices:—

TO GENTLEMEN ENGAGED IN PLANTING.

WATERER AND GODFREY respectfully invite attention to their stock of the following very desirable HARDY PLANTS.

Araucaria imbricata, from 2 to 7 feet high; as handsome as plants can be.
Cedrus Deodara, in any quantity, from 1 to 3 feet high
Do. do., 4, 5, 6, 7, 8, and 10 feet high; splendid plants
Cedars of Lebanon, 3, 4, 6, and 10 feet high
Pinus Douglasi, 3 to 10 feet
" insignis, 2 to 7 feet
" Menziesi, 3 to 7 feet
" Pinsapo, fine plants, 3 to 6 feet
" Nordmanniana, 1½ to 3 ft., all from seed and remarkably handsome
" nobilis, 1½ to 2 feet; a few larger, 5 and 6 feet high, on their own roots, and with perfect leaders
" Montezumæ, 2 to 4 feet
Pinus canadensis, 3 to 8 feet
Cupressus macrocarpa or Lambertiana, 4 to 7 feet
" thyoides variegata, 3 to 4 feet (the variegated white Cedar)
Juniperus, Upright Irish, perfect columns, 3 to 7 feet
" chinensis, 2 to 8 feet
Yew, common English, 3 to 8 feet
" Irish, 4 to 10 feet
" gold-striped, 1½ to 3 feet
" do., tall standards, 4 to 7 ft.
" Dovaston, or Weeping, worked on tall straight stems
Thuja aurea, the finest plants in the country
Libocedrus chilensis, the finest plants in the country
Large variegated Hollies
" Standard Bays

Also an immense stock of large Evergreens, Standard Ornamental Trees, &c.

All the plants here offered may be seen growing in our Nursery; they are removed every year, and will travel any distance with perfect safety. Of some, such as Araucarias, Deodaras, Golden Yews, Thuja aurea, Pinus nobilis, Nordmanniana, we have any quantity; and the plants, for root and branch, are not to be surpassed. Priced Catalogues will be forwarded on application, enclosing two postage stamps, to WATERER and GODFREY, nephews and successors of the late Hosea Waterer, Knap Hill Nursery, Woking, Surrey, near the Woking Station, South-Western Railway, where all trains stop, and where capital conveyances can be obtained.

The 2d. stamp will also include a descriptive Catalogue of their American Plants, Roses, and Nursery Stock in general.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their Patrons and the Public that their NEW CATALOGUE OF SEEDS for 1855 is now ready, and will be forwarded post free on application.

E. G. H. & Son take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list; and among the Flower Seeds only those whose beauty and merit are universally acknowledged, together with a carefully selected stock of the principal new varieties.

E. G. H. & Son beg respectfully to call particular attention to the following choice seeds of Florists' Flowers, which have been saved from a fine collection of named plants, and also to the annexed New and Choice Flowers, which they can confidently recommend, and in their Catalogue will be found the names of 20 beautiful ornamental Grasses. Also 12 variegated and ornamental foliage plants, for decorating the flower garden during the summer months, with full descriptions and other information respecting the following

HOLCUS SACCHARATUS (New Sugar Cane) 1s. and 2s. 6d.
DIOSCOREA BATATAS (Japanese Yam), 2s. 6d. each tuber.

February 17.

LYNCH'S STAR OF THE WEST CUCUMBER.—This might with propriety be called the Champion of the West, for it has won 11 prizes at different Horticultural Exhibitions. It is a seedling raised by Mr. Lynch, the well-known Gardener to the Right Hon. the Earl of St. Germans, Lord-lieutenant of Ireland. He has grown it for several years, and it has beaten everything that has been put in competition with it, including all the newest and most recently introduced varieties. We have purchased the whole stock, having given a very large sum for all the seeds in his possession, and it is now for the first time sent out; those who want a good flavoured, prolific, and prize Cucumber, we would recommend to obtain a packet of the seeds.

It is a first-rate winter fruit, and, with careful management, can be had in perfection all the year round. It is most prolific, and bears two fruit on every joint, and as many as 42 have been counted on a single plant in a row; from 5 to 22 inches in length. The fruit is quite round, like the barrel of a gun, and free from any ribs or roughness on the skin. It has a short handle, and is in every way calculated to beat any other sort in cultivation. The spines are white, and they stand out in the most prominent way. The stock is very limited.

Three seeds, per packet, 1s. 6d. | Five seeds, per packet, 2s. 6d.

The following is an official account of the number of Prizes won by Mr. Lynch, in competition with all the best Gardeners and the best varieties in the neighbourhood.—

"Royal Devon and Cornwall Horticultural Society, Nov. 11, 1854.

"DEAR SIR,—The prizes awarded you for your Cucumber are as follows:—

1851.—May 15th, First Prize
" July 17th, Extra Prize
" Sept. 4th, First Prize
1852.—May 27th, First Prize
" July 22d, First Prize
1852.—Sept. 9th, First Prize
1853.—June 8th, Second Prize
" Sept. 8th, First Prize
1854.—June 1st, First Prize
" Sept. 9th, First Prize

In all, 10 Prizes.

"I remain, dear sir, yours truly,
"NATHANIEL J. EASTON, Hon. Sec.

Mr. R. Lynch, Gardener to Earl of St. Germans, Port Eliot.

WM. E. RENDLE AND CO., SEED MERCHANTS, Plymouth.

GARDEN ORNAMENTS.—Several Hundreds of VASES, FIGURES, and SUN-DIAL PEDESTALS, which have stood wholly exposed to the late frosts, may now be inspected at

AUSTIN AND SEELEY'S SHOW YARD, Keppel Row, New Road.

☞ A few articles which have been standing as patterns for many years will be sold at reduced prices. Any gentleman unable to visit the yard may have sketches sent, if he will describe the object required, and the price.

CHEAP FUEL.

GAS COKE, as used in the Royal Conservatories, admirably adapted for Furnaces (as producing no smoke) and also well suited for Household Fires, to be had at 10s. per Chaldron in quantities of not less than 20 Chaldrons, cleared by barges or carts within a week, from the PHŒNIX GAS WORKS, Bankside, Southwark. Two Chaldrons delivered within a mile of the Works on the Surrey side of the Thames at an additional charge of 2s. per Chaldron. A smaller quantity, or delivery at a greater distance at a moderately increased rate.

8 " 6 " 8½ " 6½	13	6	"
9 " 7 " 9½ " 7½ and 10 by 8 ...	15	0	"

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2s. each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, without *a single disadvantage as a set off*"—*Gardeners' Chronicle.*

GLASS FOR CONSERVATORIES.

THOMAS MILLINGTON'S present prices for good 16 oz. sheet glass, boxes included.

6 in. by 4 in. to 6 in. by 5½ in. ...	13s. 3d.	per 100 feet.

Builders' Castings of every description kept in stock.—Mr. LYNCH WHITE'S, Old Barge Iron Wharf, Upper Ground Street (near Blackfriars Bridge), London.

MOORE'S PATENT VENTILATORS FOR CONSERVATORIES, HOTHOUSES, ETC.

JAMES VEITCH, JUN., fully impressed with the correct principle of ventilation for Plant Houses, &c. adopted by MOORE'S PATENT VENTILATORS, has had a house fitted up with them at Chelsea, which it will be a pleasure to him to show to any persons visiting his Nursery.

For the admission of air, in upright sashes, he believes it to be the most complete and best plan at present in use. In appearance it is neat and elegant, easily worked, and not liable to get out of order: but what is of far more consequence than this, these Ventilators admit the air in such a manner that they can be used in all weathers, and with them the admission of air is under command and that plants cannot fail to be benefited by their adoption.

JAMES VEITCH, Jun., *desires it to be fully understood that he has no personal interest whatever in the adoption of the above Ventilators, but believing them to be a decided improvement on all other plans, he is desirous of giving the public an opportunity of seeing and judging for themselves.*—Exotic Nursery, Chelsea, Feb. 17.

PUBLIC INVITATION.

HEATING BY HOT WATER WITH ONE BOILER.

JOHN WEEKS AND CO., King's Road, Chelsea, HORTICULTURAL BUILDERS and HOT-WATER APPARATUS MANUFACTURERS, most respectfully invite the Nobility, Gentry, and Horticulturists to visit their Nursery Establishment DURING THIS SEVERE WEATHER, and witness the efficient working of their Hot-water Apparatus. The Establishment consists of Forcing Houses, Conservatories, &c., &c., many of which are of wide and lofty dimensions, and together measuring upwards of 1000 feet in length, the whole effectually heated by ONE BOILER at the small cost of 3s. 8d. per day for Fuel and Labour. The various Houses are divided into above 40 different compartments, either of which can be heated separately, and the whole regulated at pleasure with a greater command of heat than is required.

BOILERS of ALL SIZES, and Apparatuses both Plain and Ornamental, adapted for Warming Churches, Schools, Warehouses, and Buildings of every description. Also a great variety of Horticultural Buildings to be seen in full operation, so that a lady or gentleman can select the description of House best adapted for every required purpose.

Also, a SPLENDID COLLECTION of PLANTS.

JOHN WEEKS & Co., Horticultural Establishment, King's Road, Chelsea.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 36 feet. All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

NEW WINTER SOAP.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6d. each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H R H Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, &c.?—COUPELLE'S CRINUTRIAR, though extensively imitated, is universally acknowledged as the only preparation to be really depended upon for the unfailing production of Hair and Whiskers in two or three weeks; as also checking Greyness, Baldness, &c., and rendering the Hair beautifully luxuriant, curly and glossy. Mr. WILLIAMS, 8, Lowther Street, Liverpool.—"I can now show as fine a head of hair as any person, solely from using your Crinutriar." Sergeant CRAVEN, Longford Barracks, Ireland.—"Through using your Crinutriar, I have an excellent Moustache, which I had before despaired of." Mrs. CARTER, Pangbourne, Berks.—"My head which was quite bald, is now covered with new hair." Price 2s. per package, through all Druggists and Perfumers, or sent post free on receipt of 24 penny stamps by ROSALIE COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILINE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. For the nursery, Dr. Wilson says it is unrivalled.—Price 2s. per Package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the Kingdom.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.

HOLLOWAY'S OINTMENT AND PILLS THE MOST EFFECTIVE REMEDIES FOR WOUNDS.—Mr. Rutherford, of Ballinamone, county of Leitrim, states in a letter to Professor Holloway, dated Feb. 8, 1855, "that Mr. J. Moran, farmer, in the parish of Cloone, was nearly gored to death by his own bull, whereby he received some very severe wounds, and from their awkward appearance there was no disposition in them to heal, notwithstanding he had the best medical attention, who tried various remedies without any good effect; however, at his suggestion, Holloway's Ointment and Pills were used, which in a very short time soundly healed every wound." Sold by all vendors of Medicine, and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

MR. MECHI has made arrangements with the Crystal Palace Company for a considerable additional space in the North East Gallery overlooking the Transept. In due time the necessary cases, &c., will be placed there ready for the season.—4, Leadenhall Street, Feb. 17.

AT MR. MECHI'S ESTABLISHMENT, 4, Leadenhall Street, London, are exhibited the finest specimens of British Manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury suitable for presentation. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c., as usual. Shipping orders executed for merchants and captains. An extensive assortment of superior Hair and other Brushes for the Toilet.

MR. MECHI respectfully informs his customers and the public that he has PURCHASED the CUTLERY BUSINESS of the late Mr. VINING, 125, Regent Street, and also leased the whole of the upper part of the adjoining house from Mr. Locke. The two houses will be altered, embellished, and converted into show rooms, forming a WEST-END BRANCH of Mr. Mechi's Establishment in Leadenhall Street, for the convenience of his West-end customers. It is hoped that the alterations may be completed by the middle of March, of which due notice will be given.—4, Leadenhall Street, Feb. 17.

BUY OF THE MAKERS.—BRUSHES, COMBS, and BROOMS of every description, whether for the dressing table, household, or stable use, 30 per cent. lower than any other house in the trade, at the manufacturers, J. and J. WITHERS, 36, Tottenham Court Road (opposite Bedford Street, Bedford Square).—Warranted Tooth Brushes, 3d.; superior ditto, 4d.; the best that can be made, 6d. each.—N.B. The lowest price asked and no abatement.

MESSRS. SHOOLBRED & BRADSHAW, TAILORS, 34, Jermyn Street, PATENTEES. Manufacturers of every description of ELASTICAL SURGICAL BANDAGES, as recommended by all the most eminent surgeons, in acknowledging the very extensive support they have received, beg to call attention to the various improvements they are making in patent Elastic Stockings, Knee Caps, Socks, and Ladies and Gentlemen's Spine Supporters. A new description of Belt, invaluable for prevention of Cholera and the cure of Rheumatism, Lumbago, &c. N.B. Every description of India-rubber Bandages vulcanised on the newest principle.

BASS'S EAST INDIA PALE ALE. BARCLAY'S PORTER AND STOUT, in 18 Gallon Casks, Bottles, Half-Bottles, and Imperial Pints.

BERRY, BROTHERS, & Co., 3, St. James's Street, London.

NURSERY AND SEED BUSINESS, ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the NURSERY and SEED SHOP at Taunton, for some time past in the occupation of Messrs. M'Intyre and M'Intosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required the quantity of ground may be reduced. The Nursery is about 5 minutes' walk from the Railway Station.—Apply to Mr. YOUNG, the Proprietor, Elm Cottage, Taunton.

WANTED TO RENT, with possession at Lady-day next, a small DAIRY FARM of about 120 acres of Pasture Land, with Dwelling House and suitable buildings, the counties of Gloucester, Wiltshire, or Berkshire preferred.—Apply by letter, stating particulars, to E. W. B., Post Office, Swindon, Wilts.

DORKING FOWLS.—Eggs, from remarkably large and weighty birds, of the best coloured breed, will be disposed of at 15s. the dozen, box included.—Address W. G., Railway Inn, Holme, Stilton, Hunts.

EGGS.—To be Sold, first and best breeds of the following POULTRY:—Buff Cochin China, feathered to the claws; Fine white-faced Spanish; A beautiful breed of Sebright Bantams; White silky negro Bantams, with blue ear belts.—For particulars direct to A. B. C., Northleigh, near Oxford.

TO POULTRY BREEDERS.

TO BE SOLD, cheap, a Splendid TURKEY COCK, age 20 months, winner of two prizes, weight about 25 lbs. Also some beautiful GREY DORKINGS, from Prize Stock, in sets of Cock and two Pullets, very first rate birds.—Apply to DANIEL HARRISON, Singleton Park, Kendal.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds, Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

PEAR AND APPLE TREES AND CAMELLIAS.

FROM THE CLARENDON NURSERIES, JERSEY.

MR. J. C. STEVENS is instructed by Mr. René Langelier to announce for Sale by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, 23d Feb. and following day, at 12 o'clock, without reserve, 1000 PEAR TREES of the most approved melting sorts, including Queen Victoria (not yet out) and others new to this country, all of which Mr. Langelier can warrant true to name and worthy of cultivation; 100 fine Apple Trees (Hammond's Pippin) raised in the island of Jersey by James Hammond, Esq., the fruit of first-rate quality, keeping till June; also a collection of Double Camellias with flower-buds and some in bloom, all of good sorts, and some bulbs.—Catalogues one week before the Sale of Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

N.B. Specimens of the Fruit of many of the new sorts of Pears will be included in the Sale.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by Mr. Halley to Sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, Feb. 22, at 12 o'clock, about 200 Choice Double CAMELLIAS, from 18 inches to 5 feet, comprising all the approved kinds, beautifully furnished with bloom buds; also a fine Collection of American Plants, comprising Ghent, and other Azaleas, Hybrid Rhododendrons, Kalmias, Magnolias, Andromeda floribunda, together with choice Ericas and Epacris of sorts, Roses, Dahlias in dry roots, &c.—On view the morning of Sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

CONSIGNMENT FROM GHENT FOR ABSOLUTE SALE.

MESSRS. PROTHEROE AND MORRIS are instructed by Monsieur A. Van Geert to Sell by Auction, at the Mart, Bartholomew Lane, on TUESDAY, 20th February, at 12 o'clock, about 500 fine DOUBLE CAMELLIAS and 500 INDIAN and GHENT AZALEAS consisting of all the approved kinds, well set with bloom buds; also an assortment of New Ghent Hardy Free Blooming Rhododendrons, of the finest colours, from the deepest red to the purest white. About 400 Standard Roses, including all the leading kinds, with four magnificent Standard Sweet Bays.—May be viewed the morning of sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

4, Great Russell Street, Covent Garden, 1855.

Collections of 24 Annuals, mixed, recommended by Dr. Lindley as suitable for Shrubberies, 5*s.* [on the most liberal terms
Seeds for distribution by gentlemen to their tenants and cottagers
Seeds selected and carefully packed for Australia, North and South America, India, and New Zealand, in the most secure way to arrive safe at any of the above places.

Ladies and gentlemen relying upon the judgment and experience of John Kernan, instead of being supplied (as is often the case) with what is neither useful nor ornamental, may depend upon having a selection of the most useful and indispensable Vegetables to any amount named, by the parties forwarding him their orders. The same economy will be observed in the choice of Flower Seeds. J. K. feels it almost needless to observe that the liberality of discount will be with the amount.

Old Meadow Turf, which will take a considerable time to decompose and char by the regular or natural means, may be produced by the following simple and short process:—Place four bricks raised two on two above 3 feet distance from four others similarly arranged, upon which place a sheet of iron large enough to rest fully on the bricks. By making a fire under this simple machine and allowing your Turf to remain until charred it will, when bruised, make an excellent stimulant for Annuals, Herbaceous and Pot Plants of all sorts. If the vermin or the season do not disturb them, you will not require more than one plant in a hundred of those that come up. Be careful to begin thinning when the plants are quite young. Do not sow delicate Annuals in the open borders until the end of April, or (what is better, make two sowings, one in the middle of April, and the other the beginning of May. These will succeed each other *until October*.

SEEDS SELECTED AND CAREFULLY PACKED FOR ALL CLIMATES.

Printed by William Bradbury, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 27, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be Addressed to the Editor.—Saturday, February 17, 1855.

ERRATUM.—In the Scottish Arboricultural Society's Advertisement (*Gardeners' Chronicle*, Feb. 17), the address of the Treasurer is erroneously stated to be at *Bath* in place of PERTH.

HORTICULTURAL SOCIETY OF LONDON.—THE FIRST SPRING MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, March 6, from 1 to 4 P.M.

THE FIRST EXTRAORDINARY MEETING OF THE BRITISH POMOLOGICAL SOCIETY FOR 1855 will be held at the Rooms, 20, Bedford Street, Covent Garden, London, on MONDAY, March 5th, at 1 o'clock.

All packages containing Collections of Fruit should be forwarded so as to arrive on the 3d, and addressed to

ROBERT HOGG, Secretary.

WANTED, 5000 SPANISH CHESNUT PLANTS, 5 feet to 6 feet; 5000 ASH PLANTS, 5 feet to 6 feet; and 30,000 LARCH PLANTS, 3 feet. Whoever has the same to dispose of, and can deliver them at Merpham Court, near Gravesend, may hear of a purchaser by stating the price, &c., to ROBERT BARNETT, Esq., of that place.

WANTED TO PURCHASE, a quantity of FRUIT TREE STOCKS and MAIDEN TREES.—Address, stating sorts and price, JAMES LAKE, Nurseryman, Bridgewater.

PYRAMIDAL PEAR TREES,
GRAFTED ON THE QUINCE STOCKS.

J. AND J. FRASER have still to offer strong trees of the above PEARS; a Descriptive Catalogue of the sorts may be had on application. To prevent disappointment early orders are requested, as the Stock of some of the varieties is getting low.—The Nurseries, Lea Bridge Road, Essex.

FRUIT TREES, FOREST TREES, AND SHRUBS, GARDEN AND FLOWER SEEDS, PERMANENT PASTURE GRASSES, and FINE DWARF LAWN GRASSES.—Catalogues of the above may be had on application to WILLIAM BARRATT, Saint John's Nursery, Wakefield.

STRONG OAKS.

I. AND J. GAITSKILL have on hand a fine healthy stock of the above, 1½ to 2 feet and 2 to 3 feet, which will be sold cheap. Price on application.
Hall Santon Nurseries, Whitehaven.—Feb. 24.

FOWLER AND WRIGHT, SEEDSMEN and NURSERYMEN, Glasgow, have for sale 1 year Seedling LARCH, 2 year Seedling LARCH, 1 year Seedling BEECH, and 1 year Seedling ALDER. Price forwarded on application.—Feb. 24.

LIQUIDAMBAR.—The undernamed is a buyer of either a large or small quantity of the above. Send cash price and height, to Mr. JEYES, Nurseries, Northampton.

MANGOLD WURZEL SEED, LONG RED, and YELLOW GLOBE, warranted genuine, and the growth of 1854. Price 45*l*. per ton.—Apply to R. S. HEWS, Kelvedon, Essex.

TO BE SOLD, at Prices that will be sure to give satisfaction, 10,000 STRONG CURRANTS of the following sorts, viz:—Red and White Dutch, common Black and Black Naples, Wilmot's Superb Red, Champaign and Raby Castle. Also a quantity of strong dwarf-trained Pears and Plums of the best sorts, Fastolff and other Raspberries, strong standard Pears, and a quantity of prime Seed Potatoes, well kept, of the best sorts.—For further particulars apply to JAMES LAKE, Nurseryman, Bridgewater.

TO BE SOLD, Bishop's last and best PEA, 10 to 15 quarters at 56*s*. per quarter, and 7 to 8 quarters of a superior BLUE PEA, capital boiler, or an abundant bearer for podding, 56*s*. per quarter; also a quantity of genuine Skirving's Swede Seed of last year's growth, grown from large roots; transplanted and other sorts of Turnips and Mangold Seeds, &c.—Apply to Mr. GEORGE TABER, Seed Grower, Rivenhall, Witham, Essex. Delivered carriage free. Terms cash.

CHEAP AND GOOD CINERARIAS.—Fine flowering plants from Turner's best seed in large 48 and 48 pots, just coming into bloom, at from 4*s*. to 6*s*. per dozen. Also fine plants of named varieties, consisting of Mr. and Mrs. Herbert, Adela Villiers, Garland, Constellation, Lady H. Campbell, Kate Kearney, Flora M'Ivor, Étoile de Venus, &c., at 9*s*. per dozen.—WOOD & INGRAM, Nurseries, Huntingdon.

PRIMULAS! PRIMULAS! PRIMULAS!—The true and original stock of the semi-double Primula sinensis, so highly commended in the last week's "Cottage Gardener," is now being sent out by Mr. THOS. WILD, of Ipswich, in sealed, numbered, and signed packets, at 2*s*. 6*d*. each; no other are genuine. Also the unrivalled "IPSWICH STANDARD CUCUMBER," 1*s*. per packet. Order without delay; this is the season to sow. The stock is small, and the price will increase.—THOMAS WILD, Ipswich. Agents: Turner, of Slough; Fisher, Holmes, and Co., Sheffield; Veitch and Son, Exeter.

SUTTON'S SHORT SEED LIST.

SUTTON'S SHORT SEED LIST, *containing only the most desirable sorts, will be sent post free, in return for one penny postage draft or receipt stamp.*
SUTTON & SONS, Seed Growers, Reading, Berks.

PRICES OF AGRICULTURAL SEEDS.

SUTTON'S DESCRIPTIVE LIST OF FARM SEEDS *will shortly be sent to each of* Messrs. SUTTON'S *regular customers, and should any not receive it in the course of the ensuing week, they are requested to apply for it, when it will be forwarded gratis and post free.*—JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

MESSRS. J. AND H. BROWN'S NEW PRICED CATALOGUE, post free, of American Plants, Coniferæ, Roses, Geraniums, Fuchsias, Orchidea, Stove and Greenhouse Plants, Fruit Trees, &c. A separate List of Garden Seeds, Choice Flower Seeds, 20 papers, 5*s*.; 40 do., 10*s*. free by post.
Albion Nursery, Stoke Newington, London.

T. F. WINSTANLEY'S Descriptive Catalogue of GARDEN and FLOWER SEEDS is now ready, and can be had on application, or sent free by post.
28, Market Place, Manchester.

T. F. WINSTANLEY'S Descriptive AGRICULTURAL SEED LIST will shortly be ready, and may be had on application, or sent free by post. The above List contains much useful information.—28, Market Place, Manchester.

PRICED NURSERY CATALOGUES.

A. PAUL AND SON will be happy to forward the following priced Nursery CATALOGUES in return for one postage stamp each:—A, ROSES; B, ORNAMENTAL TREES AND CONIFERS; C, FRUIT TREES; D, HERBACEOUS PLANTS; F, GREENHOUSE PLANTS, &c.; G, SEEDS; H, HOLLYHOCKS; I, BULBS.—Nurseries, Cheshunt, Herts.

ROBERT KENNEDY, Agent for Messrs. Platz and Son, Seed Growers, Erfurt, has much pleasure in announcing he has received their Catalogue of Flower and Vegetable Seeds for the trade for 1855, which abounds with new articles of great interest, and will be forwarded, per post, on application to R. KENNEDY, Bedford Conservatory, Covent Garden, London.

P.S. Also, R. Kennedy's General Catalogue of British and Foreign Ferns forwarded on receipt of six postage stamps.

CHARLES TURNER begs to intimate that his New SPRING CATALOGUE is now ready, and contains descriptive lists of—

Dahlias,	Carnations,	Scarlet and Horse-shoe Geraniums,
Fancy Dahlias,	Picotees,	Delphiniums,
Cinerarias,	Pinks,	Mimulus,
Verbenas,	Pansies,	Pentstemons,
Fuchsias,	Auriculas,	Petunias,
Hollyhocks,	Shrubby Calceolarias,	Bedding Plants, &c.,
Chrysanthemums,		

including several new Dahlias, new Verbenas, new White Bedding Calceolaria, &c., offered for the first time. Can be had on application.—Royal Nursery, Slough.

ROBERT M. STARK begs to intimate that his spring Catalogue of FLORISTS' FLOWERS, BEDDING, and select HERBACEOUS PLANTS (comprising every novelty of merit) is now ready, and may be had on application. Choice assortments of GARDEN, FARM, and FLOWER SEEDS, to which he has added several new and deserving varieties. Every other article connected with the Nursery and Seed trade.
Edgehill Nursery; and 145, Princes Street, Edinburgh.—Feb. 24

RHUBARB ROOTS for FORCING or PLANTING.—Strong one-year planted roots of MYATT'S VICTORIA and LINNÆUS, MITCHELL'S ROYAL ALBERT, at 6*s*. per doz.; HOWARD'S PRINCE ALBERT, 12*s*. per dozen. This is a larger variety than the Victoria, and is extensively cultivated about Manchester. Price to the trade of the above, per 100 or 1000, on application to MESSRS. J. MYATT AND SONS.
Manor Farm, Deptford. Feb. 24.

GENUINE SEEDS.

THE MEMBERS OF THE "SEED GROWERS SOCIETY," continue to supply genuine AGRICULTURAL, VEGETABLE and FLOWER SEEDS at Growers' prices. Lists with price and terms of business may be had on application to the Secretary, JOHN MOSS, Jun., Feering, Kelvedon, Essex.

NEW CHINESE POTATO—
DIOSCOREA (JAPONICA) BATATAS.

T. F. WINSTANLEY has received a limited quantity of the above new Potato. For description and method of planting see his Garden Seed List, where full particulars are given. T. F. W. has also a few Plants left of the Kaisha or Sweet-kernelled Apricot, a fortnight earlier than the Moor Park. Prices on application.—28, Market Place, Manchester.

NEW ASHLEAF—THE "EARLY CHAMPION."

JOSEPH WILSON, SEEDSMAN, Ipswich, offers the following varieties, which for quality and yield cannot be excelled, viz.:—

	Per bushel.—£	*s*.	*d*.
THE CHAMPION ASHLEAF...	0	12	0
JACKSON'S IMPROVED ASHLEAF	0	9	0
The SHORT TOPS	0	7	6
LORD RAGLAN, new Mammoth Round var., per sack	2	2	0
EARLY FRAME AND ASHLEAF SEEDLINGS	0	8	0

Free to London; no charge for sacks. Orders must be accompanied with a remittance.

THE FLUKE KIDNEY POTATO.—This excellent variety is now planted here as the principal crop, being more free from disease and more prolific than any other in cultivation. It was raised in Middleton, and may be had genuine in any quantity at 5*s*. per bushel of 56 lbs.—Apply to JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester.

Post-office Orders to be made payable at Middleton, Lancashire.

THE FLUKE POTATO.—A new second early variety, surpassing every other in its capability of resisting the Potato disease, and without exception the finest and most prolific Potato in cultivation. Price per cwt., 15*s*., bags included.

To be had genuine of THORNHILL & DICKSON, Lawrence Hill Nurseries; and No. 1, Wine Street, Bristol.

NEW CAULIFLOWER.

WAITE'S "ALMA," far superior to Walcheren very large and firm heads. Price to the trade 24*s*. per lb., smaller quantities 2*s*. 6*d*. per oz. No orders attended to for less quantities than one ounce.—Seed Establishment, 181, High Holborn, London.

EARLY DANIEL O'ROURKE PEAS.

J. G. WAITE begs to inform the Trade that he is now ready to execute orders for this valuable early Pea. Price can be had on application.
Seed Establishment, 181, High Holborn, London.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks, at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

COLE'S CRYSTAL WHITE, & COLE'S DWARF RED CELERY.

J. THORNELEY, COLE, & Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, near Manchester, beg to announce that they are now prepared to supply these two well-known varieties, raised by Mr. W. Cole (late of Dartford).

CRYSTAL WHITE, ½ oz. packets, free by post, for 12 stamps.
SUPERB DWARF RED, ½ oz. pkts., free by post, for 9 stamps.
Price per lb. to the Trade on application.

ROSES.

GEORGE CLARKE begs to announce that he can still supply fine Standards of all the leading varieties, his own selection, at 18*s*. per dozen. Also, fine strong dwarfs of Perpetuals, Bourbons, Tea scented, &c., 12*s*. per dozen. Well varied collections of Evergreens, Fruit Trees, Coniferæ, and every article connected with the trade, at most moderate prices. Catalogues may be had on receipt of two postage stamps.—Nursery, Brixton Hill, near London.

VINES FROM EYES.—THE CHAMPION.

JOHN BUTCHER can with the greatest confidence recommend this truly noble Grape (but little known); it was raised at Warwick by the late Mr. W. Canning. Berries, extra large and globular; skin, thin; flavour, superior to the Hambro, and 9 days earlier. Plants 5*s*. 6*d*. and 7*s*. 6*d*. each. Stock limited.
Stratford-on-Avon, Feb. 24.

IMPORTED GERMAN FLOWER SEEDS.

T. F. WINSTANLEY, has received his annual importation (direct from Frankfort) of unrivalled Collections of German Seeds, including Double Ten-Week Stocks, Asters, Zinnia elegans, Truffeaus, new Pæony-flowered Aster, very beautiful, and many other varieties too numerous for insertion. Prices on application; lists free by post.
28, Market Place, Manchester.

GRASS SEEDS, CLOVERS, ETC.

T. F. WINSTANLEY is now ready to send out his Mixture of New Grass Seeds, for Laying down New or for Renovating Old Pasture; finest Mixtures for Lawns, &c. For list of sorts and quantities, &c., see his Garden and Agricultural Seed List, to be had on application.
28, Market Place, Manchester.

CHEAP NURSERY STOCK.

IMPORTANT TO ALL PLANTERS WHO DESIRE IMMEDIATE EFFECT.

WILLIAM JACKSON & Co., Bedale, Yorkshire, beg to refer to their advertisement in the *Gardeners' Chronicle and Agricultural Gazette* of the 17th February, page 110.

IPOMŒA RUBRO CÆRULEA.—Seed of this exceedingly beautiful Climbing Annual being now obtainable at a moderate price, all cultivators of flowers having a greenhouse or wall with warm aspect are advised to include it in their spring selection.—Seed supplied to Seedsmen and Nurserymen only, by GEORGE ROBERTS, 32, Moorgate Street, London.

CORNISH EARLY WHITE BROCCOLI,
1*s*. per packet, or 6*s*. per oz.
CONQUEROR OF THE WEST CUCUMBER,
1*s*. per packet, containing 12 good seeds.

The above can be had, warranted genuine, by forwarding postage stamps for the amount to

JAMES LAKE, Seedsman, &c., Bridgewater.

MAY'S MAGNUM BONUM LETTUCE.—Parties who were disappointed last season in receiving the above, can now have it by early application, in Packets 1*s*. each, free by post. We have numerous letters to show, received from parties who had it last season, to say that it is the most magnificent Lettuce they ever saw.—Address, HENRY MAY, The Hope Nurseries, near Bedale, Yorkshire.

DOUBLE ITALIAN TUBEROSE ROOTS 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. COBBETT'S Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

R. M. STARK begs to intimate that he can supply botanists and others with the undermentioned articles:—Sets of Labels for Families, Genera, and Species of British Plants. Catalogues of Mosses, with the additions made in the recently published "Bryologia Britannica;" ditto of Marine Algæ; ditto of Zoophytes and Radiata. Seaweed Paper, Blank Books, Microscopic Specimens, and various other requisites.

Seeds or Roots of many New or Rare Plants of horticultural or botanical interest, of which lists may be had.
145, Princes Street, Edinburgh.—February 24.

GENERAL SEED ESTABLISHMENT, NORTHAMPTON.

JOHN JEYES begs leave to inform his Patrons and Friends that his general stock of Seeds is now complete, and that he shall feel obliged by their early orders. He has a good supply of all those varieties Seeds his Establishment has long been celebrated for, such as Matchless Cabbage, Imperial Cos Lettuce, Conqueror Pea, Blood Red Beet, Dwarf Prolific Bean, Snow's Green Cos Lettuce, do. Broccoli, Northampton Market Broccoli, Giant Asparagus, &c. &c.

VINES FROM EYES.—THE BLACK BARBAROSSA,
THE CHEAPEST GRAPE IN COVENT GARDEN MARKET.

JOHN BUTCHER can supply fine Plants of the above splendid late Grape. Plants with well ripened wood, stopped at from 6 to 7 feet. J. B. has been awarded Prizes for the above Grape by the Horticultural Society at Regent Street, on the following occasions:—Oct. 13, 1852; Feb. 18, 1853; Feb. 21, 1854; and Feb. 6, 1855.

All the following varieties can be had:—Black Hamburgh, Black Morocco, Black Tripoli, Black Alicant, Black West's St. Peter's, Cornichon, Black Prince, White Muscat of Alexandria, White Frontignan, White Syrian, White Malvoisie or Grove-end Sweetwater, and Red or Grizzly Frontignan.

Stratford-on-Avon, Feb. 24.

SHILLING'S SELECTED LIST OF SEEDS.
NORTH WARNBOROUGH NURSERY, ODIHAM, HANTS.

STEPHEN SHILLING will send on application his List of Seeds and Prices for the season. Those who have tried his seeds in past years can vouch for their good quality. He will also send free of carriage to the principal railway stations in Hants, Berks, and Surrey, a Dinner selection for 1 l. 10s.; a smaller selection, the contents of which will be a suitable choice of quantities for gentlemen where professional gardeners are not kept. Collections of Flower Seeds containing from 24 to 48 varieties from 5s. 6d. to 12s. free per post. Trees, Forest and Fruit; and Evergreens. Potatoes, Walnut-leaved, Shilling's Frame, &c., and all other Kitchen Garden Plants, &c.

GEORGE SMITH'S PRICED AND DESCRIPTIVE CATALOGUE of fine choice Verbenas, Fuchsias, Geraniums (Show, Fancy, Variegated, and Scarlet), Dahlias, Chrysanthemums, splendid new Hollyhocks, very choice Petunias, &c., will be forwarded in return for one postage stamp.

The Geraniums are in extra fine condition, and require repotting. Parties giving orders immediately will save much in carriage with less liability to damage by having them before they are spotted. Choice Verbena seed from the finest show flowers.—Islington Nursery, Hornsey Road, Islington, London.

NEW PLANTS FOR 1855.

AUSTEN AND MASLAN beg to recommend the following PANSIES.—1. LORD RAGLAN.—White ground, broad belting and top petals of deep glossy purple, smooth outline, texture unequalled, and fine form. This Pansy, which is a seedling of Mr. Campbell's, who raised "Robert Burns," is of the style of "France Creole," and a decided improvement on that favourite flower. 3s. 6d. per plant.

2. BLACK DOUGLAS (Turnbull's).—Dark self, nearly black; rich and fine form, as large as the "Duke of Perth," petals stiff, and for perfectly flat, good exhibition, extra fine. 3s. 6d. per plant.

ERICA FERGUSONI (Turnbull's).—A very desirable new Heath in the way of E. Marnockiana (see figured, "Gardeners' Magazine of Botany," Part 13, January, 1851), but its flowers are glorious. The tube of the corolla deep rose colour, large, and much inflated; the limb white blooming, after E. retorta, to which it is related, although of much freer growth. Well furnished Plants 15s. each; if more than three are taken, 12s. 6d. each.

The Subscribers, having purchased the entire stock of the above new Flowers, are prepared to send out good strong Plants by the first week in March. The usual discount to the trade.

Nursery and Seed Warehouse, Glasgow.—February 24.

SUPERIOR EARLY BROCCOLI.

MITCHINSON'S PENZANCE OR EARLY WHITE CORNISH BROCCOLI.—*Cultivated and invaluable for its earliness, coming into use early in February, a full-sized handsome head of excellent quality, but a shy seeder.* 1s. 6d. *per packet, or* 12s. *per ounce.* New Seed can be had in sealed packets of the following Agents in London:—NASH, MINTER, and Co., Strand; DAWE, COTTRELL, and BUNHAM, Moorgate Street; HURST and MCMULLEN, Leadenhall Street; FLANAGAN and SON, Mansion House Street; or from MITCHINSON'S Seed Establishment, Truro, Cornwall.—December 2.

From numerous unsolicited Testimonials we select the following:—

To Messrs. Mitchinson and Co., Seed Merchants, Truro, Cornwall.

"Sirs, I have enclosed 18 postage stamps for a packet of your Penzance Broccoli Seed, the same kind as you sent me last year. I hope I am not too late, for I am anxious to procure it, if possible, for I can bear testimony to its value as a new, early, and a superior Broccoli, for I have been cutting upwards of 30 heads every week from the beginning of February.

"Dorking, Surrey, April 6, 1854. "W. UNDERWOOD."

To Messrs. Mitchinson and Son, Seedsmen, Truro, Cornwall.

"Sirs,—I enclose you 1s. 6d. worth of stamps, and hope you will send me a small packet of the Early Broccoli you advertised last year. I have beat all my neighbours this year with your Broccoli, which has been very fine and true, and stood the winter well. "GEORGE PENDER."

"Sandgate, Kent, April 10, 1854."

To Mr. Mitchinson, Seedsman, Truro.
Enclosed with Specimens.

"Sir,—I beg to forward you this Broccoli, one of the sort after your own name. I have had a splendid crop of them this season, many of which measured three feet in circumference, and quality excellent. Cut the first on the 11th of February. If seed is scarce, be kind enough to save two packets.—T. BICE, Gardener. Grampound, Cornwall. April 7, 1854."

NEW PLUMS.

MR. H. DOWLING, FRUIT GROWER, Woolston Lawn, Southampton, begs most respectfully to return his sincere thanks to the Nobility, Gentry, and Public generally, for the liberal patronage he has received, and informs them that owing to his Garden being about to be cleared for building, he has to offer the above at unusually low prices. Fruit Growers and the Trade will find this a rare opportunity to supply themselves with them. H. D. has received Testimonials from those that planted them this season. He can with confidence recommend the Black Gage and Angelina Burdett as superior to any other Plum for prolificness and flavour; good strong Trees, and the prices can be obtained at Mr. CHVATE'S TURNER'S Royal Nursery, Slough; of Mr. HENDERSON, Pine Apple Place, London; or the Grower, at Woolston Lawn, Southampton.

POLYANTHUS SEED.

JAMES WOODS has again this year to offer a quantity of POLYANTHUS SEED, saved with more than ordinary care, from named and good laced flowers, which he can recommend with confidence, having had numerous Testimonials from different parts of the Kingdom of good and valuable flowers being raised from his seed. He will be able to send seed to grow 300 plants, with directions for sowing. Price 1s. per packet, or sent free, on receipt of 13 postage stamps to JAMES WOODS, Florist, Harwich, Essex.

P.S. Plants of Polyanthus will be sent out in April, with blooms on each plant, with name or otherwise, from 6d. to 3s. 6d. per plant.

J. W. has a small quantity of Auricula Seed, saved from a fine collection of Alpines, at 1s. per packet as above.

HOPS SUPERSEDED BY THE BAVARIAN BITTER, a perfect substitute for Hops, of an agreeable flavour, quite soluble in wort or beer, saving the trouble of straining through a Hop-back, and giving to Beer the well-known keeping properties of the Bavarian Beer. Price of 1 packet, 2s. 8d., which is equal to 5 lbs. of best Hops.—Prepared only by THOMAS PRATT WILLS, St. George's Square, Portsea. Free per post.

Collections suited for competition of the finest imported German Asters, German Stocks, Balsams, Larkspurs, Mangolds, Scabios, and Zinnias, from 2s. 6d. to 7s. 6d.

Dioscorea Batatas, 2s. 6d.; or five sets for 10s. 6d.

THOMAS JACKSON AND SON, Kingston-on-Thames.

THE LARGEST STOCK AND LOWEST PRICES IN ENGLAND.

JOHN WESTWOOD, the FLORAL NURSERY, Acton Road, Turnham Green, near London, having an enormous and well selected stock of SOFT-WOODED PLANTS, and most extensive premises (the glass covering 3 acres of land), is enabled to offer it to the public and the Trade at prices far lower than any hitherto heard of, but as it is impossible to convey by advertisement anything like detailed or sufficient information of the advantages or resources of his establishment, he respectfully requests all who desire to purchase plants to apply for his Catalogue for 1855 (which is now ready), and he will immediately forward it postage free.

DR. SYNTAX CUCUMBER.—The above celebrated variety has been nearly lost to gardeners for several years past. It is known by all experienced growers of Cucumbers to be the very best sort in existence for early work.

A paper sent free per post on receipt of 13 stamps.

SNOW'S HORTICULTURAL BROCCOLI.—Half-ounce Packet sent free per post on receipt of 24 stamps.

NORTHAMPTON MARKET BROCCOLI.—This variety is grown by the market gardeners here, and excites the admiration of all who see it. Visitors say "they never saw such Broccoli anywhere else." Half-ounce Packets sent free per post for 14 stamps.—JOHN JEYES, Nurseries, Northampton.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, will commence sending out April 30, 1855, the following new Seedling FUCHSIAS, raised by Messrs. Story and Banks.

Queen Victoria (Story's), scarlet, with white corolla. 10s. 6d.
Prince Albert (Banks's), fine violet corolla. 10s. 6d.
Perrugino (Story's), fine striped corolla. 10s. 6d.
Empress Eugenie (Story's), rosy crimson, white corolla. 10s. 6d.
Ranunculæflora (Story's), fine double white corolla, 21s.
Lady of the Lake (Story's), blush, white corolla. 10s. 6d.
Water Nymph (Story's), globe-flowered, fine white corolla, 10s. 6d.
Raffaelle (Story's), beautiful variegated corolla. 10s. 6d.
Mrs. Story (Story's), fine white corolla. (In accordance with Mr. Story's wish, this was named after Mrs. Story, as it was in his opinion the finest). 10s. 6d.

Or if the set of Nine are taken, the price 4l. 4s., including SNOWDROP (STORY'S). This was received from Mr. Story as possessing a double white corolla, and described by himself and others who saw it in flower as a very beautiful variety. It was the first double white raised by him; but the plant did not flower in the Wellington Nursery after it was received by Messrs. HENDERSON; and through three stout branches having been broken off it it did not quite correspond with the description given by Mr. Story and others a few months after to Mr. A. Henderson when at Newton making inquiries respecting the Plants. Consequently no charge will be made for it, but one will be presented with every set ordered.

FUCHSIA, BANKS'S FAVOURITE (BANKS), considered the finest of the blue violet corollas. 10s. 6d.

For further particulars see page 62 of the *Gardeners' Chronicle* for Jan. 27; or a list will be sent post free on application.

MESSRS. E. G. HENDERSON & SON having purchased of the late W. Story, Esq., of Newton, in the county of Devon for ONE HUNDRED GUINEAS, all Seedling Fuchsias with white Corollas, which new feature in this tribe he succeeded in introducing, and in consequence of an advertisement which appeared in the *Gardeners' Chronicle* some few weeks back from Messrs. Lucombe, Pince, & Co., of Exeter, offering two new Fuchsias similar in character to those purchased of the late Mr. Story, and after a written communication with that gentleman it was thought necessary for one of the firm to make further inquiries about them, and in consequence Mr. ANDREW HENDERSON went to Exeter and Newton, where he was informed by a jobbing gardener at Newton that he had received Seven Pounds for them after (as the said jobbing gardener stated) he had been offered £20 for them by a nurseryman in London, but whose name or address he did not know.

Messrs. E. G. H. & Son give the above explanation in consequence of a great number of their customers throughout the autumn having ordered plants of them at higher prices than are above quoted. This reduction is made in consequence of information which they have received that leaves no doubt on their minds but that those to be sent out by Messrs. Lucombe, Pince, & Co. are similar in character to the above.

Messrs. E. G. HENDERSON & SON, of the Wellington Road Nursery, St. John's Wood, London, beg to inform their patrons and the public that their New Catalogue of Seeds for 1855 is now ready, with full descriptions and other information, and will be forwarded post free on application.

E. G. HENDERSON & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their list, and among the Flower Seeds only those whose beauty and merit are univerally acknowledged, together with a carefully selected stock of the principal new varieties. They would call particular attention to the following new and choice seeds, which they can confidently recommend:—

Per packet—	s.	d.
Antirrhinum, extra fine ...	0	6
Auricula, fine mixed ...	1	6
Abronia umbellata	1	6

Dioscorea Batatas (Japanese Yam), 2s. 6d. each tuber.
20 Ornamental Grasses (see Catalogue).
12 Ornamental foliage Annuals.—February, 1855.

To Farmers, Potato Growers, and Others.

JACKSON'S PATENT PREPARATION
FOR
PRESERVING POTATOES, WHEAT, AND OTHER SEEDS

From DISEASE, the RAVAGES of the SLUG, GRUB, and WIREWORM, in addition to which the CROPS are brought forward in HEALTH AND VIGOUR, and the yield is greatly increased, in proof of which the following extracts are given from numerous letters received by Mr. JACKSON.

EXTRACTS:—

"One of the fields of this farm, the property of MRS. STANBURY, was planted with Regents Potatoes in April last, some of which were prepared by you. The result now is, that the whole of the crop from the unprepared sets is thoroughly diseased, and hardly worth the trouble of taking up; while those raised by the side of them from the prepared sets are not only in a beautiful state of preservation from the disease, but the produce is much greater,—the Potatoes are more numerous than the others; indeed, if there were no such thing as the disease to be feared, it would be worth the trouble and expense of preparing the sets by your process, even for the sake of the improved crops. I shall certainly, for the future, prepare all my Potatoes for seed by your process; and I intend to adopt it for preserving my Wheat from the Smut.

"G. B. BAXTER.

"Pelment Farm, Eltham, Kent, August 28, 1854."

"Admiral Sir J. A. GORDON, K.C.B., Marlee House, Blairgowrie.

"SIR,—I have received your note of the 16th. The Potatoes that came here from England, prepared by Mr. JACKSON, were planted in a piece of new ground, and according to the directions sent by him along with them as to distance between the plants, &c. They came up well, with strong healthy stems; I have now taken the whole crop up, and there is not the slightest appearance of any disease amongst them. They are of large equal size and very prolific. There were long black unprepared Kidneys planted in the same patch, and a great deal of them are not fit for use, at least a third part are diseased. I hope Mr. JACKSON'S process may be widely known, as it is a great boon.—I am, &c., JOHN SHANKS,

"Forester, Kildrummy Castle.

"Kildrummy Castle, Aberdeenshire, November 17, 1854."

"I am very much pleased with the result of the experiments I have made with your Prepared Potatoes; for I planted them, without any manure, in ground where for several years I have hardly had a sound Potato, and I now find the crop perfectly free from disease, and in a very fine condition; while those of the same sort, unprepared, which were planted at the same time, and next to them, are diseased and eaten by worms.

"The Potatoes from the Prepared Seed were so remarkably good that I was induced to weigh them, and I found, to my great astonishment, that they were as 200 to 150 of the others, or about 25 per cent. in favour of your preparation.

"T. AUSTEN, Nurseryman and Seedsman.

"Blackheath, Kent, 24th August, 1854."

Sold by Messrs. CHARLWOOD & COWPERS, Seedsmen, Covent Garden; and JOHN KERNAN, Seedsman, 4, Great Russell Street, Covent Garden; all Seedsmen and Chemists; and at the Patentee's, 18, Cannon Street, London Bridge, in Packets of One, Two, Three or Four Pounds, or in Bulk for the use of Farmers and Potato Growers.

GREAT NOVELTIES FOR THE ENSUING SEASON,
FUCHSIAS WITH WHITE COROLLAS.

LUCOMBE, PINCE AND CO. beg leave to announce that they shall be prepared to send out two splendid and entirely novel Seedling Fuchsias, early in May next, viz.:—

FLORENCE NIGHTINGALE.

Pure white corolla, with brilliant scarlet sepals, finely reflexed; an extremely lovely and novel variety.

CALANTHIFLORA-PLENA

(The DOUBLE Snowdrop Corolla'd Fuchsia.)

Pure double white corolla, resembling a fine large double Snowdrop, with rich scarlet sepals; altogether distinct from anything of the kind ever yet produced. Price 10s. 6d. each.

The usual discount to the Trade when three or more are taken.

Exeter Nursery, Exeter.—ESTABLISHED 1720.

NEW PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer to Amateurs and to the trade his following new plants:—

ACHIMENES (TREVIRANIA), AMBROISE VERSCHAFFELT. This is the finest Achimenes of all; a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 1, 1855. Nice plants will be sent out next May, each 8s.—N.B. One over if three plants are taken.

TYDŒA WARSCEWICZII; magnificent plant for foliage, and particularly for the flowers. It is the finest gesneriaceous plant of all: a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 1, 1855. Strong plants are now ready for sale, each 15s.—N.B. One over if two plants are taken.

RHODODENDRON (HARDY) PRINCE CAMILLE DE ROHAN. This is the finest hardy variety raised; a correct drawing is figured in L'ILLUSTRATION HORTICOLE, Number 2, 1855. This variety is warranted to be quite hardy, and very free bloomer. Nice plants will be sent out next May, each 15s. N.B. One over if three plants are taken.

Agent in London: Mr. R. SILBERRAD, 5, Harp Lane, Great Tower Street.

CHARLES SHARP begs to call the attention of the Nobility, Gentry, and the Trade to his unrivalled collection of SEED POTATOES, which have been grown and selected with great care, and perfectly free from disease. The undermentioned prices include hampers and package. Terms to the Trade known on application.

POTATOES:—

	Per bush. of 4 st.		Per bush. of 4 st.
Ash-leaf Kidney (Jackson's)	10s.	American Early	7s.
Ash-leafed Kidney (Walnut-leafed)	10s.	Forty-Fold	8s.
Early Emperor	10s.	Kentish Kidney	8s.
" Shilling's	10s.	York Regent's	6s.
" Martin's Globe ...	10s.	White Rough	6s.
" Oxford Large ...	8s.	French Blues	7s.
" Round Frame (for Forcing)	8s.	White Kidney	8s.

Seed Establishment, Wisbeach, Cambridgeshire.

CHARLES SHARPE AND CO. beg to call the attention of the public to their superior collection of POTATOES FOR SEED, as under, which they can recommend as being the best in cultivation. Price per bushel of 4 stones:—

Early Ash-leaved Kidney	9s.	Early Emperor	9s.
" " Jackson's	9s.	" Cockney	9s.
" Round Frame	9s.	" Oxford	8s.
" Martin's Globe.....	9s.	" White Rough	6s.
" King	8s.	" Foxe's Seedling	9s.
" Hen's Nest	10s.	" American	7s.

FOR SECOND EARLY AND LATE PLANTING:—
Yorkshire Regent, 6s.; Prince Regent, 6s.; Fluke Kidney, 8s.

DIOSCOREA JAPONICA, HOLCUS SACCHARATUS.—Price on application.

Nursery and Seed Establishment, Sleaford.

MYATT'S NEW SEEDLING POTATO.
BROCKLEY KIDNEY.

W. AND J. MYATT can dispose of a limited quantity of the above excellent new Potato, which they have proved to be a first-rate variety, and has been selected as the best out of many thousand seedlings raised at Manor Farm.

In flavour it is quite equal to the Ash-leaf, and for produce very far superior; it is a compact strong grower, and ripens off quickly, making it an invaluable summer variety. To be sent out in peck bags, 3s.: bushel, 56 lbs., 10s.

Also, EARLY MAY or BRITISH QUEEN, the earliest round Potato, middling size, suitable for planting whole, 5s.; Early Shaw, 5s.; York Regent's, 5s.; Hen's Nest, a good field Potato, 5s. per bushel; Red Ash-leaf, 2s. 6d. per peck. These are all one year's growth, from Yorkshire or Scotch sets, and will be delivered free to any railway terminus in London.

Post Office Orders are requested from unknown correspondents, payable at Deptford, to WILLIAM MYATT.

Manor Farm, Feb. 24.

OLD NURSERY AND SEED ESTABLISHMENT, NORTHAMPTON.

JOHN PERKINS, SEED-MERCHANT & GROWER, begs to call the attention of his Patrons and the Public to his General Stock of GARDEN and AGRICULTURAL SEEDS, &c., the greater portion of which have been grown by himself, and which he can with confidence recommend. Also the following kinds of Seed Potatoes, true to name:—Ashleaf, or Albion Kidney, Jackson's Improved Albion do., Golden Multiplier do., Fluke Kidney, Lapstone Kidney, Thurston's Conqueror, Rounds, Ready Penny, Early King, Hicks' Early, Soden's Early Oxford, Early Shaws, Rillet's Flourball, American Seedling, Holland's Red.

The above may be obtained as cheap or cheaper than any other house in the trade, prices of which may be had on application. Also 100,000 one to two years' Seedling Oak, 50,000 Scotch Firs, 2 ft., 20,000 to 30,000 Beech, 3 to 4 ft. In addition to the above, J. P. has a very extensive stock of Fruit and Forest Trees, Flowering Shrubs, Evergreens, &c., &c., priced catalogues of which will be forwarded on application.

Nurseries about a quarter of a mile on the Bedford Road, also on the Billing Road, and at Wootton.

Seed Warehouse, Market Square, Northampton.

LATE WHITE SUPERB BROCCOLI—"EMPEROR."

E. P. DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletsons, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2s. 6d. each. This Broccoli has been raised by the Messrs Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

PURE MAMMOTH BROCCOLI.—Numerous applications having been made to Messrs. Elletsons last season for Seed of the Pure Mammoth Broccoli, they determined to allow a flat to stand for Seed, carefully selected from the original stock, producing heads from 18 lbs. to 25 lbs. each. E. P. D. having purchased the stock of this celebrated Broccoli, is prepared to send it out in packets at 2s. 6d. each.

Each may be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND Co., 26, Down Street, Piccadilly, beg to announce that their Mixtures of Grass Seeds are now ready for delivery at the following prices:—

Mixtures for laying Land down to permanent Grass, for light, heavy, and other soils (allowing 2 bushels and 12 lbs. to the acre ... ... 30s. per acre.
Mixtures for Park or Field Lawns (allowing 2 bushels and 12 lbs. to the acre) ... ... 32s. per acre.
Mixtures for improving and renovating old Grass Land, 1s. per lb.
Mixtures (finest sorts) for forming Lawns... ... 1s. 3d. per lb.

These Seeds are are all new, and have all been properly cleaned and their growing properties fully tested. Directions for sowing accompany the seed.

G. G. and Co.'s New Priced AGRICULTURAL CATALOGUE will shortly be ready, and will be forwarded free on application.

GEORGE GIBBS & CO., SEEDSMEN,
26, Down Street, Piccadilly, London.

DAWE, COTTRELL, AND BENHAM, beg to inform their friends and patrons that their Descriptive Retail LIST of FLOWER, GARDEN, and AGRICULTURAL SEEDS is now ready, and may be obtained, post free, on application.

D., C., & B. also beg to offer the following CHOICE ROOTS at very low prices.

Anemones, single purple, very fine ...	per dozen ...	3s.
" " scarlet, " ...	" ...	2s.
" " mixed, " ...	per lb. ...	3s.
Gladiolis florabundus, large	per dozen ...	2s.
" Gandavensis, very fine ...	" ...	5s.
and many other choice varieties.		
Iris Germanica, splendid var., mixed,	per dozen ...	4s.
Ranunculus, mixed, double, very fine,	per 100 ...	5s.
Tuberoses, fine double, Italian ...	per dozen ...	3s.

36, Moorgate Street; and 304, Laurence Pountney Lane, Cannon Street, London.—Established at 28, Cornhill, 1720.

ARTHUR HENDERSON AND CO. beg leave to inform their patrons and friends that their stock of VEGETABLE and FLOWER SEEDS (containing many choice and new kinds) is now ready for sending out. Catalogues may be had on application.

Lilium giganteum Seed	per 100 seeds ...	5s.	0d.
White-topped Clary	per packet ...	1	6
Limnanthus sulphurea odorata...	" ...	1	6
